The optical absorption below the absorption edge in $x=0.2$ and $x=0.3$ $Hg_{1-x}Cd_xTe$ alloys has been investigated. In *p*-type alloys of both compositions and at wavelengths equivalent to approximately 0.75 E_g to 20 μm, the measured optical absorption cross sections at 90 K were close to the intervalence cross sections calculated using first-order Kane **k.p** theory with a bandstructure parameter P of 8.4×10^{-8} eV cm and a heavy hole mass of 0.5 m. For $Hg_{0.8}Cd_{0.2}Te$ the absorption cross sections were close to 1.8×10^{-15} cm^2 for wavelengths between 15 and 20 μm. For $Hg_{0.7}Cd_{0.3}Te$, the absorption cross sections increased approximately 1×10^{-15} cm^2 at 5 μm to about 3×10^{-15} cm^2 at 20 μm. At higher temperatures the intervalence absorption cross sections decreased; in addition, an intraband contribution to the total hole absorption cross section was observed. (29 refs.)

68195 Scattering activities and symmetry of skeletal stretching vibrations of long chain molecules by Raman spectroscopy. M.Harrand (Lab. de Recherches Optiques, Univ. de Reims, Reims, France).
J. Chem. Phys. (USA), vol.78, no.7, p.4777-9 (1 April 1983).
Because of crystal splitting, polarized Raman spectra of crystalline *n*-paraffins give incomplete informations on chain modes. On the contrary, with the oriented samples obtained by Peticolas' drops method (1982), it is possible to deduce the vibration symmetry of the chains of dipalmitoylphosphatidylcholine (DPPC), uniaxially oriented as confirmed by spectra. The planar zig-zag configuration of the carbon skeleton is characterized by two stretching vibrations ν_s(C-C) and ν_a(C-C). Contrary to the $\nu(CH_2)$ Raman lines of oriented DPPC, strong in the *YY* polarization, the ν(C-C) lines are weak: The strongest intensity of ν_s (1126 cm^{-1}) and ν_a (1062 cm^{-1}) is observed in *ZZ* and *ZX* respectively, although one expects the opposite when considering the motions of carbon atoms. To explain this anomaly the author calculates the Raman scattering tensors of the skeletal vibrations from tensors attributed to the isolated C-C bond. (7 refs.)

68196 The OH stretching spectrum of liquid water: a random network model interpretation. A.C.Belch, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4817-23 (15 April 1983).
The authors report the results of an analysis of the OH-stretching region of the vibrational spectrum of liquid water. The random network model is realized by time-averaged molecular dynamics configurations of ST-2 water. The hydrogen bond network is defined using a geometric definition of bonded pairs of molecules. Force constants are calculated using empirically derived formulas relating the shifts of the intramolecular frequency and anharmonic potential energy coeficients with a hydrogen bond strength parameter. The strength parameter is related to the separation in a molecular pair, hence, it has a distribution of values defined by the molecular configuration in the model liquid. Fermi resonance between the OH stretching mode and the bending overtone is shown to be an important second-order effect in the spectral band shape. The calculated spectra compare well with experimental results and support the contention that the spectral features are dominated by intermolecular interactions. (23 refs.)

68197 An improved analysis of the OH stretching spectrum of amorphous solid water. G.Nielson, S.A.Rice (James Franck Inst., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.4824-7 (15 April 1983).
The authors report a calculation of the OH stretching region of the infrared and Raman spectra of amorphous solid water. The configuration space distribution of water molecules employed as a realization of the amorphous solid is a modified scaled version of the Henderson model of amorphous Ge. The molecular dynamics includes, in addition to interaction between OH oscillators, local variation of hydrogen bending strength, anharmonicity of the OH stretching motion, and Fermi resonance between the overtone of the HOH bending motion and the OH stretching motion. A comparison with available experimental data is made and is used to analyze some of the shortcomings of the configuration space model and the dynamical analysis. (7 refs.)

68198 Raman scattering study of pressure effects on the structure and the coordination-induced charge redistribution in 4-cyanopyridine. P.T.T.Wong (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.8, p.4840-51 (15 April 1983).
The Raman spectra in the frequency regions of the lattice and the internal modes of the crystalline CNPy and $Zn(CNPy)_2Cl_2$ have been measured at various pressures up to 16.5 and 20 kbar, respectively. A structural phase transition at 10 kbar in CNPy and two at 8.2 and 18 kbar in $Zn(CNPy)_2Cl_2$ were observed. At high pressure, CNPy suffers a lattice distortion along the eigenvector of a soft phonon, and $Zn(CNPy)_2Cl_2$ undergoes a molecular configuration distortion which leads to the softening of a rotational phonon. The charge distribution on the CNPy molecule is changed by coordination and also by external pressure and this charge redistribution has been correlated with the vibrational spectral changes. (39 refs.)

68199 Raman and visible-ultraviolet spectra of polyhalide anions in molten I_2/KI-LiI, I_2/CsCl-LiCl, and I_2-ICl/CsCl-LiCl. W.C.Child,Jr. (Dept. of Chem., Carleton Coll., Northfield, MN, USA), G.N.Papatheodorou.
J. Phys. Chem. (USA), vol.87, no.2, p.271-5 (20 Jan. 1983).
Molten eutectic mixtures of KI-LiI and CsCl-LiCl at 300-400°C were equilibrated with I_2 vapor or I_2-ICl vapor at pressures of 0.002-2 atm and were investigated by means of Raman and visible-UV spectroscopy. The observed polarized Raman bands were attributed to the symmetric stretching vibrations of I_3^-(112 cm^{-1}), I_2Cl^- (184 cm^{-1}), and ICl_2^-(271 cm^{-1}). Further evidence for the presence of these trihalide anions in the melts was given by the visible-UV spectra. A band at 161 cm^{-1} in the Raman spectrum of the I_2/KI-LiI melt was attributed to a polyiodide of higher molecular weight than the triodide. There is evidence for the disproportionation of I_2Cl^- in the I_2/CsCl-LiCl melt. (21 refs.)

68200 Temperature study of infrared reflection spectra on various faces of MTPP(TCNQ)$_2$ single crystals. R.Swietlik, A.Graja (Inst. of Molecular Phys., Polish Acad. of Sci., Poznan, Poland).
J. Phys. (France), vol.44, no.5, p.617-21 (May 1983).
Crystals of the ion-radical salt MTPP(TCNQ)$_2$ undergo a first-order structural phase transition at the temperature $T_p=315.7K$. This phase transition has a pronounced influence on the infrared spectra. In this paper the authors present and discuss the infrared spectra of MTPP(TCNQ)$_2$ as a function of temperature. During thermal cycling they have observed an interesting thermal hysteresis of the reflection coefficients for different bands. Moreover, they have related the observed spectral modifications with the enthalpy of the phase transition. (14 refs.)

68201 Impurity effect on the Raman spectra of $Sr_{0.6}Ba_{0.4}Nb_2O_6$. S.Kuroda, K.Kubota (School of Sci., Kwansei Gakuin Univ., Nishinomiya, Japan).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.527-30 (1983).
The impurity effect on the rare earth ion doped $Sr_{0.6}Ba_{0.4}Nb_2O_6$(SBN40) was studied at room temperature. Doping with the rare earth ions of Pr^+ or Nd^{3+} changed the Raman profile: spectral broadening, central frequency shifts and the relative intensity decreasing. Two reasons are considered according to the ferroelectric and optical properties of the rare earth ion doped SBN40: impurity-induced crystal disorder and the crystal structure change. SBN40 is the general disorder crystal and the disorder which is enhanced by doping the rare earth ion is especially strong along the *x-y* plane of the material compared with that along the polar *c*-axis. (13 refs.)

68202 A thermal and Raman investigation of the phase transitions above room temperature in anhydrous potassium acetate. T.E.Jenkins (Phys. Dept., Univ. of St. Andrews, St. Andrews, Scotland), P.O'Brien.
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.565-8 (1983).
Results using thermal and Raman techniques are presented on the phase transition in potassium acetate occurring above room temperature. Two phase transitions are observed at $Tc1=349K$ and $Tc2=413K$. The magnitude of the entropy change at $Tc1$ and the Raman results suggest that this transition is orientational in nature and is due to rotation of the acetate ion about the *c-c* axis. The $Tc2$ transition is displacive in nature, and the Raman results show a marked softening of the lowest frequency mode as $Tc2$ is approached from below. (6 refs.)

68203 Infrared spectra of $KNaSO_4$ and $K_3Na(SO_4)_2$. M.Natarajan, E.A.Secco (Dept. of Chem., St. Francis Xavier Univ., Antigonish, Nova Scotia, Canada).
J. Solid State Chem. (USA), vol.47, no.2, p.231-5 (April 1983).
The infrared spectra, transmittance and polarized reflectance, of $KNaSO_4$ and $K_3Na(SO_4)_2$ are reported. Group theoretical analysis was carried out and a vibrational assignment proposed on basis of C_{3v} and D_{3d} symmetries. Factor group and site effects are discussed. (7 refs.)

68204 Intramolecular vibrations in ICE. Interpretation of experiments on the isotopic isolation of H_2O molecules. Yu.Ya.Efimov (Inst. of Chemical Kinetics & Combustion, Acad. of Sci., USSR).
J. Struct. Chem. (USA), vol.23, no.3, p.407-14 (May-June 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.3, p.101-9 (May-June 1982). [received: Feb. 1983]
Machine modeling of the form of the bands in the vibrational spectra of H_2O molecules diluted in the lattice of cubic ice D_2O has been carried out. Experimental data recently obtained on infrared absorption and anisotropic Raman scattering have been explained. The form of the spectra of the isotropic Raman scattering has been predicted. The parameters, not perturbed by collective interactions, of water molecules in the three-dimensional network of H-bonds characteristic of pure ice have been calculated; the expected effect of the variation of some of them on the spectral contours has also been calculated. The existence of a statistical distribution of the energy of the hydrogen bond in the specimens of mixed ice H_2O+D_2O studied has been confirmed, and the corresponding distribution of the equilibrium internuclear distances estimated. (23 refs.)

68205 Raman studies of B_2O_3 glass structure: $^{10}B\rightarrow{}^{11}B$ isotopic substitution. F.L.Galeener, A.E.Geissberger (Xerox Palo Alto Res. Centers, Palo Alto, CA, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.343-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Reports the $^{10}B\rightarrow{}^{11}B$ isotope shifts of the Raman spectra of vitreous B_2O_3. The authors interpret the unshifted lines (450 and 808 cm^{-1}) in terms of extended and localized modes (respectively) of a network of boroxol rings. (10 refs.)

68206 Raman study of $xB_2O_3.(1-x)SiO_2$ glasses obtained by hot pressing of gels. L.Beys, M.Abenoza, P.Hillaire, J.Phalippou (Lab. de Spectroscopie I, Univ. des Sci. & Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.355-8 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The glasses of the binary system $xB_2O_3(1-x)SiO_2$ (where $0<x\leq0.2$) were elaborated by the hot pressing of the gels. Raman spectra of these glasses are reported. The Raman line situated at 808 cm^{-1} shows that boroxol groups are present in the glass structure, even for low B_2O_3 content. The bands situated at 679 and 931 cm^{-1}, the intensity of which changes with B_2O_3 content, reveals the presence of B-O-Si bonds in the structure of these glasses. It was thought that a critical zone composition corresponding to $x=0.10$-0.15 distinguishes the respective composition range where planar structural units BO_3 and boroxol groups are present for the most part in the glass-structure. (14 refs.)

68207 Raman study of geometrical disorder at semiconductors surfaces. R.Carles, J.B.Renucci, A.Zwick, M.A.Renucci (Lab. de Phys. des Solides, CNRS, Toulouse, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.363-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Geometrical disorder is induced at the surface of samples by rough mechanical polishing. Its influence on both vibrational and electronic properties are reported in InSb, InAs and GaSb. (9 refs.)

68208 Size effects in the Raman spectra of anatase. Ya.S.Bobovich, M.Ya.Tsenter.
Opt. & Spectrosc. (USA), vol.53, no.3, p.332-3 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.562-3 (Sept. 1982). [received: May 1983]
The authors have made a study of samples of Sitall, which is a composite material produced by subjecting complex glasses to a special heat treatment that results in their volume crystallization. Interest was focused on the Raman spectra of one structural component of Sitall: titanium dioxide, which precipitates in the form of anatase with typical crystal radii of $\sim$20 Å. The authors measured the frequency and halfwidth of the two anatase bands at 144 and 642 cm^{-1} at various sample temperatures and at various values of external hydrostatic pressure applied to the sample. (10 refs.)

68209 Nature of the active site in surface-enhanced Raman scattering. T.E.Furtak, D.Roy (Dept. of Phys., Rennselaer Polytech. Inst., Troy, NY, USA).
Phys. Rev. Lett. (USA), vol.50, no.17, p.1301-4 (25 April 1983).
Experiments involving competitive and cooperative adsorption of pyridine, Cl^-, SCN^-, and Tl and voltage induced resonance shifting show that the largest surface-enhanced Raman scattering intensity comes from complexes of these species adsorbed in defects which cover less than 3% of the Ag surface. The resonance is attributed to charge transfer excitation from Ag to pyridine and from SCN^- to Ag which is communicated to all vibrations of the complex. (11 refs.)

68210 Effect of non-magnetic impurities on the observation of superconducting gap excitations by Raman scattering. G.C.Mohanty, S.N.Behera (Inst. of Phys., Bhubaneswar, India).
Pramana (India), vol.19, no.6, p.645-63 (Dec. 1982). [received: April 1983]
The effect of small concentrations of non-magnetic substitutional impurities (characterized by changes in mass, nearest neighbour force constants and local electron-phonon interaction) on the observability of superconducting (SC) gap excitations in 2H-$NbSe_2$ by Raman scattering is considered within the theoretical framework of Balseiro and Falicov (1980) (BF). The phonon self-energy when evaluated for $q=0$ using the Einstein oscillator model for the host phonons is seen to have a pole corresponding to the impurity mode besides the gap excitation one around 2Δ previously obtained by BF. A splitting of the impurity mode into two in the SC state is predicted. An enhancement occurs in the strength of the SC gap excitation peak whenever it is close to the impurity mode. The data from the experiments of Sooryakumar, Klein and Frindt (1981) on impure samples of 2H-$NbSe_2$ are discussed in the light of the present calculation. (11 refs.)

68211 Resonant Raman scattering at the indirect triplet exciton in AgBr in high magnetic fields. H.Stolz, W.Wassmuth, W.von der Osten (Univ. Gesamthochschule Paderborn, Paderborn, Germany), Ch.Uihlein.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.383-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Resonant two-phonon Raman scattering involving the indirect triplet exciton is studied in AgBr at $T=1.8K$ and magnetic fields up to 20 Tesla. By a quantitative analysis of the scattered 2TO(L) intensity the authors are able to determine the symmetry of hole states to be $L^-{}_{4,5}$, the exchange splitting $\Delta=0.17$ meV and effective g-values of $g_c=1.46$ and $g''{}_v=2.61$ for electrons and holes. The observed diamagnetic shifts lead to a value of 32 meV for the exciton binding energy. (7 refs.)

68212 Optical pumping of hot phonons in GaAs. C.L.Collins, P.Y.Yu (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.386-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Optical pumping of hot LO phonons in GaAs has been studied as a function of the excitation photon frequency. The experimental results are in good agreement with model calculation which includes both inter- and intra-valley electron-phonon scatterings. The Γ-L and Γ-X intervalley electron-phonon interactions in GaAs have been estimated. (15 refs.)

68213 Bound magnetic polarons and spin-flip Raman scattering in (Cd, Mn)Se. D.Heiman, P.A.Wolff, J.Warnock (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.485-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Spin-flip Raman scattering is used to determine the spin-flip energy ΔE as a function of applied field and temperature in (Cd,Mn)Se. At moderate B-fields, ΔE is approximately proportional to B/T resulting from mean-field behavior. At low fields, ΔE is described by a statistical mechanical model of bound magnetic polarons. Thermodynamic fluctuations of the magnetic ions are included by calculating the partition function in a general way using an exchange Hamiltonian. At $B=0$ the theory predicts the line-width and line-shape. (10 refs.)

68214 Raman study of Ge and GaP microcrystals. S.Hayashi, H.Kanamori (Dept. of Electrical Engng., Kyoto Tech. Univ., Kyoto, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.520-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Raman scattering from Ge and GaP microcrystals prepared by gas evaporation technique has been investigated. In the case of Ge, the existence of amorphous particles of the order of 80 Å in diameter was demonstrated. For crystalline Ge particles the size dependence of Raman spectra was observed. In the case of GaP, the surface phonon mode was clearly observed when the particles are about one order of magnitude smaller than the wavelength of incident laser radiation. (5 refs.)

68215 Microscopic theory of Raman and infrared spectra of transition metal dichalcogenides in CDW state. N.Nagaosa, E.Hanamura, S.Uchida (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.526-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Multi-phonon processes, hybridization of oscillator strength and interference of dia- and para-magnetic contributions to Raman intensity are discussed to understand the dynamics of the electron-phonon coupled CDW system. (7 refs.)

68216 Vibrational properties of silicon networks with vacancy, hydrogen, or fluorine. K.Suzuki (Max-Planck-Inst. fur FKF, Stuttgart, Germany), A.A.Maradudin.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.529-31 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The vibrational spectra of silicon networks with and without a vacancy are calculated using the real space version of the recursion (continued fraction) method for clusters containing approximately 18000 atoms. Results are discussed in the light of infrared and Raman measurements on amorphous silicon containing hydrogen or fluorine. (21 refs.)

68217 Lifetimes of LO phonons in GaP. J.Kuhl, W.E.Bron (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.532-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The decay of coherent LO phonons in GaP has been analyzed by time resolved coherent anti-Stokes Raman scattering. The measured lifetimes decrease from 26.0±2.5 ps at 5K to 6.7±0.3 ps at 300K. (6 refs.)

68218 Theory of electronic Raman scattering from n-$KTaO_3$. S.Katayama (Dept. of Phys., Osaka Univ., Toyonaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.576-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A theory of Raman scattering by the low-lying coupled plasmon-longitudinal optical (LO) phonon modes (L_-) in n-$KTaO_3$ is presented by taking into account the soft mode-like behavior of the L_- modes induced by the strong polar electron-LO phonon coupling at low temperatures. The electronic inter-band Raman scattering between the conduction band and its split-off upper subband is also theoretically explored, with emphasis on the temperature variation of the spectral line width. The calculations are in good agreement with the recent experiments. (6 refs.)

68219 Generalized electronic susceptibility and charge density waves in transition metal dichalcogenides. S.Sugai (Dept. of Phys., Osaka Univ., Toyonaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.587-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Lattice vibrations in 2H-$TaSe_2$ and 2H-$NbSe_2$ are investigated by one- and two-phonon Raman scattering in the normal and charge density wave (CDW) phases. The generalized electronic susceptibility is obtained from the two-phonon scattering intensity as a function of temperature, and with its use the temperature dependent energies of the Kohn anomaly mode and the soft CDW modes are calculated. The agreement with the directly obtained data from this experiment is excellent. In 2H-$TaSe_2$ four A_g-modes and two B_{1g}-modes are observed in the commensurate CDW state as expected from the orthorhombic superlattice structure. The discommensuration in the incommensurate CDW phase gives the continuous change of the Raman spectra over the three CDW phases. (6 refs.)

68220 Raman scattering from hydrogenated amorphous silicon. S.A.Lyon (Dept. of Electrical Engng., & Computer Sci., Princeton Univ., Princeton, NJ, USA), R.J.Nemanich.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.871-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The Raman scattering from amorphous silicon has been obtained to within 7 cm^{-1} of the exciting laser line. For hydrogenated silicon the Raman intensity does not go to zero at zero frequency as expected for a Debye solid. Instead the Raman spectrum is essential flat for energy shifts below approximately 50 cm^{-1}. Amorphous silicon without hydrogen, produced by ion implantation of arsenic into single crystal silicon, showed at least a factor of 5 less scattering at low energies than heavily hydrogenated films. The temperature dependence of the intensity of the low frequency scattering could not be described by usual one-phonon or two-phonon processes. Similar low frequency scattering has been previously observed from glasses and interpreted in terms of thermally activated relaxation of two-level systems. The data indicate that the incorporation of hydrogen in amorphous silicon produces two-level systems. (17 refs.)

68221 New silicon hydrogen infrared vibrational band associated to H-Si-Cl configurations in an amorphous silicon matrix: Green's function theory approach. J.Chevallier, S.Kalem, J.Bourneix (LPS, CNRS, Meudon, France), M.Vandevyver.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.874-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The infrared transmission spectra of hydrogenated and chlorinated amorphous silicon samples show the appearance of a new silicon hydrogen induced band at 740 cm^{-1}. This band is due to HSiCl species where hydrogen and chlorine are bound to the same silicon atom. Green's-function theory is used in order to calculate the localized vibrational mode frequencies of various SiX, SiX_2 and SiXX′ species. (9 refs.)

68222 Calculation of the infrared spectra of hydrogenated and fluorinated amorphous Si. E.Martinez, F.Yndurain (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.935-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The infrared absorption of a-Si:H is calculated. It is found that the extra-mode at 214 cm^{-1} which is observed in the infrared spectra of a-Si:H, F is due to the presence of internal small (~7 atoms) surfaces in the material associated with voids in the samples. The authors characterize the mode by the calculation of the correlation functions relating the motion of the atoms. The infrared activity of the mode is discussed in detail. (10 refs.)

68223 Investigation of large molecular fragments in glassy $Ge_{1-x}(Se, or S)_x$. K.Murase, T.Fukunaga, Y.Tanaka, K.Yakushiji, I.Yunoki (Dept. of Phys., Osaka Univ., Toyonaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.962-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
In order to see the medium range order in $Ge_{1-x}(Se, or S)_x$ glass, pressure as well as composition dependence of vibrational spectra is investigated. It is shown that Raman spectrum with perpendicular polarization in $Ge(Se, or S)_2$ is well reproduced by the density of states calculation for a relaxed large molecular fragment assuming 'outrigger raft'. The A_1 band shifts to the high energy side with increasing pressure. The pressure coefficient is very small at $x=2/3$. The Raman spectra due to Se chains show appreciable softening at high pressures. The characteristic spectra due to S_8 rings disappear at not more than 20 kbar. The glass containing tin atoms is found to be of great use to understand the structure of the chalcogenide glasses. (11 refs.)

68224 Observation of a Soret-Dufour effect for laser-generated carriers in germanium. J.S.Preston, H.M.van Driel (Dept. of Phys., Univ. of Toronto, Toronto, Canada).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.1021-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The absorption of high-intensity laser radiation in semiconductors can generate high carrier densities and temperatures. If the absorption coefficient is high, large lattice temperature gradients and, therefore, band-gap gradients are produced. Under certain conditions it is possible for temperature gradients and not density gradients to dominate the carrier diffusion process, with carrier confinement near the surface being possible. The authors present preliminary evidence of this effect based on 10.6 μm reflectivity probing of carriers generated by 0.53 and 1.06 μm excitation pulses in germanium. (7 refs.)

68225 Chalcogenides and pnictides of group VIII transition metals: far-infrared spectroscopic studies on compounds MX_2, MXY, and MY_2 with pyrite, marcasite, and arsenopyrite structure. H.D.Lutz, G.Schneider, G.Kliche (Lab. fur Anorganische Chem., Univ. Siegen, Siegen, Germany).
Phys. & Chem. Miner. (Germany), vol.9, no.3-4, p.109-14 (1983).
The far-infrared (FIR) spectra of pyrites, marcasites and loellingites, and arsenopyrites, of the type MX_2, MY_2 and MXY with M=Fe, Co, Ru, Rh, Os, Ir, X=S, Se, Te, and Y=P, As, and Sb have been studied. A group theoretical treatment has been made of the phonon modes. For the internal Y-Y and X-Y stretching modes, infrared (IR) spectra are obtained only in the case of arsenopyrites and lines are found in the ranges 440-490, 470-510, 450-490, 430-450 and 400-420 cm^{-1} for MP_2, MPS, MPSe, MAsS, and MSbS type compounds, respectively. From the obtained spectral intensities, weighted mean phonon frequencies, i.e. central frequencies as defined by Plendl (1961), and mass weighted ones have been calculated and interpreted in terms of the strength of the MX and MY bonds, particularly the 3d, 4d, and 5d transition metal compounds. The method of preparation and X-ray data of the chalcogenides and pnictides studied are also given. (21 refs.)

68226 Spin-flip Raman scattering, bound magnetic polaron, and fluctuations in (Cd,Mn)Se. D.Heiman (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA), P.A.Wolff, J.Warnock.
Phys. Rev. B (USA), vol.27, no.8, p.4848-60 (15 April 1983).
The spin-flip energy of donor-bound electrons is investigated in the semimagnetic semiconductor $Cd_{1-x}Mn_xSe$. Temperature and magnetic field dependences are measured with the use of Raman scattering and calculated theoretically from a statistical-mechanical model. Results of spin-flip Raman scattering are obtained for $x=0.01$ and 0.1 at temperatures from 1.5 to 30K and fields to 10 T. For $x=0.1$, and spin-flip energy is large (≤ 26 meV), giving g values approaching 200 at low temperatures. This enhancement is interpreted as an effective magnification of the field due to the exchange interaction between the carrier electron spin and the Mn^{2+} spins. The magnitude and temperature dependence of g are explained with the use of the mean-field approximation. At zero magnetic field and spin-flip energy is finite due to thermal fluctuations in the local magnetization and the bound magnetic polaron. These processes are incorporated in the theory which is used to derive simple formulas for the spin-flip energy and line shape. Good agreement is found between theory and experiment. The scattering strength and selection rules are also studied. The absolute cross section exceeds 10^{-20} cm^2/sr and is resonantly enhanced as the absorption edge is approached from lower energy. (20 refs.)

68227 Raman scattering in highly disordered amorphous phosphorus. R.J.Pomian, J.S.Lannin (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), B.V.Shanabrook.
Phys. Rev. B (USA), vol.27, no.8, p.4887-94 (15 April 1983).
Raman scattering measurements are presented on amorphous phosphorus (*a*-P) films deposited by RF and DC sputtering under conditions that enhance structural disorder. This includes RF sputtering at increased substrate bias as well as DC sputtering employing in situ measurements on surfaces at 80K. In addition, the influence of annealing of the Raman spectra has been studied. The experimental results indicate that substantial changes in the Raman spectra occur relative to more ordered RF sputtered *a*-P films prepared at high pressure. These changes, which are most noticeable in low-temperature DC sputtered films, are interpreted in terms of modifications of both intermediate- as well as short-range order. The results indicate that modifications of intermediate-range order are primarily manifest by changes in the Raman coupling parameters, whereas the most disordered films indicate broadening of the phonon density of states as well. The influence of changes in short-range order on the polarized Raman spectra is related to dynamical correlation effects. (19 refs.)

68228 Far-infrared absorption of small-palladium-particle composites. P.Chylek (Dept. of Phys., Tufts Univ., Medford, MA, USA), D.Boice, R.G.Pinnick.
Phys. Rev. B (USA), vol.27, no.8, p.5107-9 (15 April 1983).
The authors use the recently derived size-distribution-dependent expression for the effective dielectric constant of a composite medium. Because of observed clustering of Pd particles they assume a broad size distribution for the small Pd particles embedded in KCl matrix. They obtain very good agreement between their theoretical calculation and experimental results. Values given by earlier theoretical calculations were by a factor of 10 below those supported by the measured data. (9 refs.)

68229 Comment on 'Role of atomic-scale roughness in surface-enhanced Raman scattering. A.Otto (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).
Phys. Rev. B (USA), vol.27, no.8, p.5132-6 (15 April 1983).
For original paper see ibid., vol.24, p.2289 (1981). The experiment recently reported by Wood is not in contradiction with considering atomic-scale roughness as playing an important role in the surface-enhanced Raman scattering process. (40 refs.)

68230 Reply to 'Comment on "Role of atomic-scale roughness in surface-enhanced Raman scattering"'. T.H.Wood (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5137-8 (15 April 1983).
For original paper see ibid., vol.24, p.2289 (1981), for comment see ibid. vol.27, p.5132 (1983). Otto argues that his original data can support the model for the importance of atomic-scale roughness (ASR) in surface-enhanced Raman scattering (SERS) if a process which he proposes for low-temperature film growth is used. This process is not supported by the resistivity data which he cites. Although several enhancement mechanisms probably do contribute to SERS, the conclusion of the original experiment, that enhancements due to ASR contribute less than 10^3 of the effect, remains valid. (8 refs.)

68231 Antimony(III) and bismuth(III) complexes of 2-amino-1,3,4-thiadiazole and 2-ethylamino-1,3,4-thiadiazole. A.C.Fabretti, G.Peyronel, A.Giusti (Istituto di Chimica Generale e Inorganica, Univ. di Modena, Modena, Italy).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.311-13 (1983).
The following antimony(III) and bismuth(III) complexes of 2-amino-1,3,4-thiadiazole (atz) and 2-ethylmino-1,3,4-thiadiazole (eatz) have been prepared and study by IR and Raman spectroscopy: $SbCl_3$.2 atz, $SbBr_3$.1.5 atz, SbI_3.3 atz, $Sb(ClO_4)_3$.4 atz, $SbCl_3$.6 eatz, $SbBr_3$.eatz, SbI_3.1.66 eatz, $BiCl_3$.1.5 atz, $BiBr_3$.atz, BiI_3.1.75 atz, $Bi(ClO_4)_3$.5 atz, $BiCl_3$.3 eatz, $BiBr_3$.1.25 eatz, BiI_3.1.5 eatz. The ligands are bounded through the amine nitrogen atom with ν(MN) bands in the 530-400 cm^{-1} region. Part of the ClO_4^- ions are coordinated in the solid perchlorate complexes. (16 refs.)

68232 The role of C=O transition dipole-dipole coupling interaction in uracil. J.Bandekar, G.Zundel (Phys.-Chem. Inst., Univ. Munchen, Munchen, Germany).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.337-41 (1983).
Theoretical arguments are presented, based on Davydov's excitation theory, for expecting the presence of coupling between C=O transition dipoles in uracil. In order to observe the effects of these coupling interactions, relevant experiments have been performed and their results discussed. The observed C=O band-splittings in uracil seem to be in support of such a coupling between various C=O dipoles within the unit cell of uracil. Since this transition dipole-dipole coupling interaction leads to band-splittings in the double-bond region, it is proposed that these splittings might provide a way to distinguish between different conformations in polynucleotides as well as in nucleic acids. (31 refs.)

68233 Normal coordinate analysis treatment on uracil in solid state. J.Bandekar, G.Zundel (Phys.-Chem. Inst., Univ. Munchen, Munchen, Germany).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.343-55 (1983).
A normal coordinate analysis has been performed on the unit cell of uracil. Transition dipole-dipole coupling interaction between C=O groups within the four molecules in the unit cell was found necessary to explain the observed band splittings in the double-bond region. It has been proposed that this new interaction may be important in the authors' future attempts to distinguish between various conformations in polynucleotides and nucleic acids. Bands due to NH in-plane and out-of-plane bending modes were assigned by means of the spectra of uracil, 1-methyluracil and 3-methyluracil. Spectra of uracil and C_5-deuterouracil were made use of in assigning bands due to CH deformation modes. Bands due to C_2=O and C_4=O deformation modes were assigned by studying the spectra of uracil, 2-thiouracil and 2,4-dithiouracil. NH inplane bending mode bands have shown no indications of effects due to interactions through transition dipole-dipole coupling. NH out-of-plane bending mode bands have shown no indications of effects due to interactions through transition dipole-dipole coupling NH out-of-plane bending mode bands were found to be unusually sensitive to the strengths of hydrogen bonding. Normal mode calculations have shown a mixing of in-plane and out-of-plane bending modes below 1000 cm^{-1}. It is hoped that the calculations performed will provide the basis for future studies of polynucleotide as well as nucleic acid conformations by making use of the conformational sensitivity of the C=O stretching bands. (64 refs.)

68234 The temperature-dependence of the far-infrared spectra of L-alanine. J.Bandekar (Phys-Chem. Inst., Univ. Munchen, Germany), L.Genzel, F.Kremer, L.Santo.
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.357-66 (1983).
Far-IR spectra in the region 20-600 cm^{-1} are reported for solid L-alanine as a function of temperature between 6 and 300K. Understanding of the temperature-sensitive as well as the temperature-insensitive bands is aided by the normal coordinate analysis of L-alanine. Bands containing contributions from hydrogen bonds, skeletal deformation and $NH_3^{\$}+$ torsion are found to be highly sensitive to temperature changes. Although the hydrogen bonds are stronger at lower temperatures, no evidence of amide formation is detected even at 6K. Thus the zwitterion form seems to be more stable that the amide form in the temperature range studied. (52 refs.)

68235 Vibration spectra of 2-pyridinethione, 3-pyridazinethione and 2,4-dithiouracile. A.Lautie, J.Herbieu, J.Belloc (Lab. de Spectrochimie Infrarouge et Raman, CNRS, Thiais, France).
Spectrochim. Acta Part A (GB), vol.39A, no.4, p.367-72 (1983).
The IR and Raman spectra of polycrystalline 2-pyridinethione, 3-pyridazinethione, 2,4-dithiouracile and corresponding N-deuterated derivativies have been investigated in 400-40 cm^{-1} range. Solutions in various solvents were also examined. An assignment for all intramolecular fundamentals is given in apolar solvents. A metastable solid phase has now been shown-up for the deuterated 2,4-dithiouracile. In these compounds, the strength of NH...S hydrogen bonds are similar to NH...O interaction of corresponding 'oxo' molecules and characterised by νNH frequencies about 2900 cm^{-1}. (28 refs.)

68236 Competition among adsorbed species for surface sites on Ag electrodes as determined by SERS. J.F.Owen, T.T.Chen, R.K.Chang (Section of Appl. Phys., Yale Univ., New Haven, CT, USA), B.L.Laube.
Surf. Sci. (Netherlands), vol.125, no.3, p.679-98 (March 1983).
The surface enhanced Raman scattering intensity from halides (F^-, Cl^-, Br^-, and I^-), water, pyridine adsorbed on a Ag electrode has been measured as a function of electrode potential. Competition is evident among the adsorbed species for surface sites on the Ag electrode during the electrochemical oxidation-reduction cycle. Furthermore, the presence of pyridine in the electrolyte influences the adsorption of halides and water. (25 refs.)

68237 The adsorption of CO on Pt(111) studied by infrared reflection-adsorption spectroscopy. B.E.Hayden, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Surf. Sci. (Netherlands), vol.125, no.3, p.787-802 (March 1983).
The interaction of CO with a clean Pt(111) surface at adsorption temperatures between 85 and 300K has been studied with infrared reflection-absorption spectroscopy (IRAS) as well as with TPD and LEED. In accordance with electron energy loss data, bands due to the C-O stretch are found in both the linear and bridging regions. The high resolution of IRAS shows, however, that there are two distinct bands in the bridging regions which can be assigned to CO in two-fold bridge and three-fold hollow sites. The results suggest a facile interconversion between the two species which is promoted by the occupation of excited states of the low frequency high-amplitude bending modes (frustrated translations). This accounts in turn for the increasing disorder observed with LEED at higher adsorption temperatures. For coverages above $\theta=0.5$, where a continuous splitting of the extra LEED features is observed, the relative intensities of bands in the bridging and linear regions favour the 'fault-line' description of Avery (1981) rather than the incommensurate layer model. (32 refs.)

68238 Ethylene on silver: development of surface enhanced Raman lines with exposure. I.Pockrand (Phys. Inst. III, Univ. Dusseldorf, Dusseldorf, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.192-6 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Adsorption of ethylene on silver films (T_s=120K) as a function of exposure has been studied by following the surface enhanced Raman (SER) signal of the symmetric scissors mode. Exposures as low as 10^{-3} L were easily detected demonstrating the very high sensitivity of SERS for this system. (21 refs.)

68239 Raman scattering spectra of K_2ZnCl_4. V.F.Katkov, V.N.Moiseenko, V.I.Pastukhov, S.A.Flerova (State Univ., Dnepropetrovsk, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1599-600 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2824-6 (Sept. 1982). [received: April 1983]
Homogeneous clear crystals of K_2ZnCl_4 were prepared by the Czochralski method. The samples studied were in the form of a right parallelopiped, 6×3×4 mm, with its edges parallel to the *a*, *b*, and *c* axes, respectively (for the $C_{2v}{}^9$ phase, $a\|P_s\|2_1$, where P_s is the spontaneous polarization). The Raman spectra and phonon frequencies of the ferroelectric phase of K_2ZnCl_4 were recorded at 300K in six scattering geometries, corresponding to the six nonzero independent components of the Raman scattering tensor for the C_{2V} group. (12 refs.)

68240 Experimental and theoretical study of Raman scattering in $Hg_2(Cl_xBr_{1-x})_2$ mixed crystals. C.Barta, G.F.Dobrzhanskii, G.M.Zinger, M.F.Limonov, Yu.F.Markov (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1672-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2952-62 (Oct. 1982). [received: April 1983]
Raman scattering was used to investigate the vibrational spectra of single crystals of mixed univalent mercury halides $Hg_2(Cl,Br)_2$. The experiments revealed optical vibrations with one, two, and three modes. The composition dependences of the frequencies were calculated by means of the model of cell-type uniform displacements, on the assumption that the $Hg_2(Cl,Br)_2$ mixed crystals consist of molecules of three types: Hg_2Cl_2, Hg_2ClBr, Hg_2Br_2. The classification of the solutions obtained was proposed and this allowed them to be correlated with the various observed types of behavior of optical vibrations in $Hg_2(Cl,Br)_2$. (13 refs.)

68241 Vibrational spectrum of barium nitrite hydrate $Ba(NO_2)_2.H_2O$ crystals. V.P.Gladkikh, G.F.Dobrzhanskii, A.A.Karamyan (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1727-9 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3051-5 (Oct. 1982). [received: April 1983]
Polarized Raman spectra of a $Ba(NO_2)_2.H_2O$ crystal in the temperature range 300-77K were investigated for the first time. A group-theory analysis of the vibrational spectrum was made and a specific symmetry was attributed to each observed line. Interesting features were observed in the region of internal vibrations of the nitrite group $NO_2{}^-$. It was found that the $Ba(NO_2)_2.H_2O$ lattice, with spatial symmetry $C_6{}^2$ or $C_6{}^3$, contains two sets of $NO_2{}^-$ ions in different positions. A considerable directional dispersion of the antisymmetric stretching vibration of the $NO_2{}^-$ ions was observed. (6 refs.)

78.35 BRILLOUIN AND RAYLEIGH SCATTERING

68242 Comment on 'Light scattering study of the phase transition in sym-triazine' [and reply]. A.I.M.Rae (Dept. of Phys., Univ. of Birmingham, Birmingham, England), A.Yoshihara, E.R.Bernstein, J.C.Raich.
J. Chem. Phys. (USA), vol.78, no.7, p.4788-90 (1 April 1983).
Measurements of the Brillouin spectra from sym-triazine have been recently reported (ibid., vol.76, no.6, p.3218, 1982) and the results have been interpreted in the light of a theory of the phase transition which has been the subject of some discussion. The purpose of the comment is to point out that the light scattering results, as interpreted, are inconsistent with the results of previous experimental measurements and that some of the parameters obtained by fitting the results to the theory are not consistent with values determined previously. Yoshihara et al. reply to Rae's comment. (15 refs.)

68243 Influence of ionic strength on the diffusion of polystyrene latex spheres, bovine serum albumin, and polynucleosomes. K.S.Schmitz, Mei Lu, J.Gauntt (Dept. of Chem., Univ. of Missouri, Kansas City, MO, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5059-66 (15 April 1983).
Quasielastic light scattering methods were used to determine apparent diffusion coefficients (D_{app}) for polystyrene latex spheres, bovine serum albumin, and polynucleosomes under conditions of neutral *p*H and low ionic strength (0.1-50 mM). Data were collected at several time intervals (Δt) at each of several scattering angles (θ) in the range $35<\theta<120$ and analyzed by the asymptotic analysis method (D_{app} vs T, where $T=N\Delta t$ is the time window for the $N+1$ point autocorrelation function). These data suggest that the asymptotic limit $D_{app}(T\rightarrow 0)$ is independent of θ for the thre systems examined, whereas the asymptotic limit $D_{app}(T\rightarrow\infty)$ appears to be proportional to the reciprocal of the total light scattering intensity. These results are interpreted in terms of 'free' and 'temporal aggregate' domains within the polyelectrolyte solution. The critical size, hence stability, of the temporal aggregate is proposed to result from a balance between attractive forces arising from fluctuations in the small ion and polyion distributions and the disruptive Brownian forces. Under conditions of extremely low ionic strength, direct interactions between polyions tend to dominate as inferred from data in the literature. These observations suggest at least four regimes in the description of the ionic strength dependence of D_{app}. (40 refs.)

68244 Photon correlation spectroscopy of polystyrene as a function of temperature and pressure Carroll, P.J. Stevens, J.R. (Bell Labs., Murray Hill, NJ, USA). G.D.Patterson, P.J.Carroll, J.R.Stevens (Bell Labs., Murray Hill, NJ, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.605-11 (April 1983).
Photon correlation spectroscopy is employed to study the slowly relaxing density and anisotropy fluctuations in bulk atactic polystyrene as a function of temperature from 100 to 160°C and pressure from 1 to 1330 bar. The light-scattering relaxation function is well described by the empirical function $\phi(t)=\exp[-(t/\tau)^{\beta}]$, where for polystyrene $\beta=0.34$. The average relaxation time is determined at each temperature and pressure according to $\langle\tau\rangle=(\tau/\beta)\Gamma(1/\beta)$ where $\Gamma(x)$ is the gamma function. The data can be described by the empirical relation $\langle\tau\rangle=\langle\tau\rangle_0 \exp[(A+BP)/R(T-T_0)]$ where R is the gas constant and T_0 is the ideal glass transition temperature. The empirical constant A/R is in good agreement with that determined from the viscosity or the dielectric relaxation data (1934K). The empirical constant B can be interpreted as the activation volume for the fundamental unit involved in the relaxation and is found to be comparable to one styrene subunit (100 mL/mol). The quantity B appears to be a weak function of temperature. (14 refs.)

68245 Photon correlation spectroscopy of poly(methyl methacrylate) near the glass transition. G.D.Patterson, P.J.Carroll, J.R.Stevens (Bell Labs., Murray Hill, NJ, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.613-23 (April 1983).
Poly(methyl methacrylate) (PMMA) has been studied by photon correlation spectroscopy in the temperature range 120-150°C. The relaxation function for longitudinal density fluctuations were determined and analysed using the empirical function $\phi(t)=\exp[-(t/\tau)^{\beta}]$. The average relaxation times were calculated for each temperature and compared to mechanical and dielectric relaxation data. The agreement between the various techniques for the primary glass-rubber relaxation was good. The relaxation function observed by light scattering became increasingly broad as the temperature was lowered. This is similar to the results reported previously for poly(ethyl methacrylate) (PEMA). In fact, the light-scattering relaxation function is dominated by the secondary relaxations in these two polymers. Nevertheless, the average relaxation time $\langle\tau\rangle$ is dominated by the longest relaxation times associated with the primary glass-rubber relaxation. (27 refs.)

68246 Brillouin scattering observation of phonon scattering by inhomogeneities in phase separated glasses. J.Pelous, A.Essabouri, R.Vacher (Lab. de Spectrometrie Rayleigh-Brillouin, Univ. des Sci. & Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.549-51 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The authors have studied by Billouin scattering the attenuation and velocity of hypersonic waves in a glass formed by quenching an aqueous solution of LiCl (molar electrolyte content: 10%). This material has been used because the phase separation in this material can be easily controlled by heat treatments and detected by measuring the Rayleigh scattering intensity. The elastic properties appear to depend on heat treatment. The differences observed for various samples are independent of temperature and seems likely to be due to scattering of acoustic phonons by structural inhomogeneity. (4 refs.)

68247 **Light scattering by two dimensional electron systems.** A.Pinczuk, J.M.Worlock (Bell Telephone Labs., Holmdel, NJ, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.637-42 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Resonant inelastic light scattering studies of two dimensional electron systems at semiconductor interfaces are described. The emphasis of the discussion is on the results obtained in GaAs-(AlGa)As heterostructures. (46 refs.)

68248 **Brillouin scattering investigation of paraelectric KH_2PO_4 near the tricritical point.** R.W.Gammon (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), E.Courtens, W.B.Daniels.
Phys. Rev. B (USA), vol.27, no.7, p.4359-68 (1 April 1983).
A high-resolution Brillouin scattering study of the soft acoustic mode of KH_2PO_4 in the hydrostatic-pressure range 0-4 kbar is presented. All spectra could be fitted closely by the usual mean-field coupled-mode model. From those fits, the pressure dependence of the ferroelectric-mode relaxation rate is derived. At pressures near and above the tricritical point, the transition can be approached so closely that the Brillouin spectrum becomes strongly overdamped and very narrow (~50 MHz). Under those conditions, the elastic central peak of even the best available crystal becomes a dominant spectral feature, while the maximum dielectric constant is close to 10^6. (32 refs.)

68249 **High-resolution resonance Brillouin scattering and the effect of stress on GaAs.** R.Sooryakumar, P.E.Simmonds (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Phys. Rev. B (USA), vol.27, no.8, p.4978-85 (15 April 1983).
Five-pass Fabry-Perot interferometry is used to obtain the linewidths of exciton polaritons resonant Brillouin scattered in GaAs. Both interbranch and intrabranch peaks are measured. An interpretation of the results in terms of excitons with an energy-independent damping is shown to be inadequate for GaAs. The effect of uniaxial stress is investigated and discussed. Stress-induced splitting (greater than the longitudinal-transverse splitting of the exciton) of the degenerate valence band at the Γ point accounts for the observed decrease in the masses of the decoupled excitons. The values of these masses are in agreement with band-structure parameters. The value $\delta=0.0\pm0.02$ meV for the exciton exchange parameter has been determined from these data. (26 refs.)

68250 **Brillouin scattering in layered structures.** R.Hotz, J.K.Kruger, R.Siems (Fachbereich Phys., Univ. des Saarlandes, Saarbrucken, Germany).
Solid State Commun. (USA), vol.46, no.2, p.155-8 (April 1983).
Theoretical and experimental results on Brillouin scattering in inhomogeneous materials are presented: Normal elastic modes and Brillouin intensities have been calculated for a periodic layer system. Measurements on semicrystalline polybutene-1 are discussed in terms of the theoretical results. Both theory and experiment yield several Brillouin lines in *VV* scattering instead of the one peak characteristic for homogeneous specimens. (16 refs.)

68251 **Brillouin spectroscopy in $K_2Ba(NO_2)_4$.** Y.Luspin, G.Hauret (Lab. d'Etudes Phys. des Materiaux, Univ. d'Orleans, Orleans, France).
Solid State Commun. (USA), vol.46, no.5, p.397-400 (May 1983).
The temperature dependence of elastic stiffnesses of $K_2Ba(NO_2)_4$ is investigated in the range −140 to +160°C, in which two phase transitions have been reported. Marked anomalies appear at the lower transition, in contrast with continuous variations through the upper transition. Results are compared to those obtained near the upper transition by an ultrasonic method and they are qualitatively discussed. (9 refs.)

68252 **Spectroscopic properties of nickel(II) ion in loaded mordenite.** E.D.Garbowski, C.Mirodatos, M.Primet, M.V.Mathieu (Inst. de Recherches sur la Catalyse, Villeurbanne, France).
J. Phys. Chem. (USA), vol.87, no.2, p.303-8 (20 Jan. 1983).
Ni(II) ions exchanged in sodium mordenite form highly asymmetrical complexes after dehydration, probably located in the specific catonic wall sites of the zeolite. These ions can coordinate CO or NO and give new carbonyl or nitrosyl complexes. The carbonyl complexes are reduced by hydrogen at room temperature into isolated nickel atoms whereas, in the case of nitrosyl complexes, NO groups shield nickel ions against reduction. In the absence of NO or CO ligands, the nickel ions are easily reduced into metal particles. This metallic phase can be completely reoxidized and redispersed by NO while O_2 reoxidation is only partial and requires higher temperatures. (30 refs.)

68253 **Optical absorption spectrum of PMMA via laser calorimetry.** P.Avakian, W.Y.Hsu, P.Meakin, H.L.Snyder (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Experimental Station, Wilmington, DE, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.647-55 (April 1983).
The optical absorption spectrum of poly(methyl methacrylate) (PMMA) has been obtained in the wavelength range 570-780 nm via laser calorimetry (employing a dye laser source). Because of the low thermal conductivity of PMMA, the complete solution to the heat conduction equation (carried out numerically) was required in the analysis of the data. At the wavelength of minimum absorption (near 647 nm), the absorption coefficient had the value 153 dB/km. (12 refs.)

68254 **Radiation and spectral characteristics of sapphire crystals produced by various methods.** A.L.Apanasenko, N.A.Kazakov, N.A.Kulagin, S.V.Landar', L.A.Litvinov, A.E.Ovechkin.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.808-13 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR),* vol.37, no.1, p.98-103 (July 1982). [received: March 1983]
Investigates the fundamental growth defects typical of the various growth techniques and the spectral characteristics of sapphire crystals over a wide range of wavelength. A comparative analysis is presented of the optical absorption, thermoconductivity, and thermoluminescence of leucosapphire produced by various techniques. (8 refs.)

68255 **Light polarization by chains of highly dispersed Fe, Co, and Ni particles.** M.A.Manaevskii, Yu.I.Petrov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.232-3 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR),* vol.53, no.3, p.392-4 (Sept. 1982). [received: May 1983]
To investigate the polarizing properties of Fe, Co, and Ni chains, pairs of identical samples were prepared. The samples were placed in Sf-26 or Specord-61 spectrophotometers in the path of the beam one after another, initially so that the chains in them were arranged mutually perpendicularly, then mutually parallel. The difference of the summed optical densities of the samples in the two positions, for the sake of brevity, is called dichroism (ΔD). The general regularities observed in the optical transmission spectra of Fe, Co, and Ni are the following: (1) ΔD monotonically decreases with an increase in λ from 350 to 1000 nm, and a further increase in λ practically does not change ΔD. (2) The greatest dichroism ΔD_{max} in the visible region of the spectrum is possessed by the samples obtained at an argon pressure $p\sim1$ Torr: $\Delta D_{max}\leq1$ Fe; $\Delta D_{max}\leq0.5$ for Co; and $\Delta D_{max}\leq0.1$ for Ni. Reduction of the argon pressure to 0.1 Torr leads to a decrease in ΔD_{max} of sometimes an order of magnitude. Increasing p to several Torr changes ΔD little. However, it considerably worsens the adhesion of the deposit. (3) Under identical conditions of preparation ΔD is greater for those samples having greater optical density. (4) Oxidation in air at a temperature of 200°C is accompanied by a decrease in D. (6 refs.)

68256 **Optical absorption of CdS:Nd crystals.** G.F.Dobrzhanskii, O.V.Fialkovskaya, L.I.Khirunenko, S.P.Smirnov (Inst. of Phys., Acad. of Sci., Kiev, Ukranian SSR).
Phys. Status Solidi b (Germany), vol.116, no.1, p.K31-4 (1 March 1983).
The authors study the optical absorption spectra of CdS crystals doped with neodymium ions. The spectra (5850 to 6050 Å) at T=4.2K consist of a group of closely spaced sharp lines due to transitions between the components of the ground $^4I_{9/2}$ and the excited $^2G_{7/2}(^4G_{5/2})$ states of trivalent Nd ions. The investigations were made every 5K. The broadening of the lines with temperature rise can be attributed to the increasing interaction with lattice phonons. The change of the intensity ratio of different lines may be due to the change with temperature of a number of Stark levels involved in the absorption. (8 refs.)

68257 **Optical absorption spectrum of thulium acetate in solution.** S.V.J.Lakshman, C.K.Jayasankar (Dept. of Phys., S.V. Univ., Tirupati, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.642-53 (Nov. 1982). [received: April 1983]
The partial derivatives for Tm^{3+} ion have been calculated in terms of Racah (E^k) parameters. Radiative transition probabilities for fluorescence levels $^3P_0$, $^1I_6$, $^1D_2$ and $^1G_4$ of Tm^{3+} in thulium acetate are estimated. (17 refs.)

68258 **Absorption spectrum of Cr^{3+} ion in $KAl(SO_4)_2.12H_2O$.** S.V.J.Lakshman, A.Sundar Jacob (Dept. of Phys., S.V. Univ., Tirupati, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.654-8 (Nov. 1982). [received: April 1983]
The optical absorption spectrum of Cr^{3+} ion in Potassium Aluminium Sulphate single crystal has been studied. The values of the crystal field and Racah parameters derived are as follows: $Dq=1735$ cm^{-1}; $B=695$ cm^{-1}; $C=3128$ cm^{-1}. (11 refs.)

68259 **Non linear optical transmission of CdSe.** P.Lavallard, P.H.Duong, T.Itoh (Groupe de Phys. des Solides, ENS, Univ. Paris 7, Paris, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.401-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
With a dye laser, the authors studied the optical transmission of a very thin CdSe crystal. At high excitation intensity, the exciton absorption line broadens and increases to such a degree that the transmitted intensity decreases when the incident light intensity is increased. They show that the scattering of polaritons on bound excitons is a catastrophic process which explains well the observed negative dynamical absorption coefficient. (5 refs.)

68260 **Theory of free-electron optical absorption in n-InSb.** P.Pfeffer, W.Zawadzki (Inst. of Phys., Polish Acad. of Sci., Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.425-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Theory of free-electron absorption in InSb-type narrow gap semiconductors is developed and used to describe experimental data for n-InSb. Electron-two-phonon interaction is shown to give negligible contribution to absorption, while plasmon generation is an important absorption mechanism. Good agreement between the theory and experiment is obtained for acoustic deformation potential C=−14.6 eV. (17 refs.)

68261 **The contribution of the Staebler-Wronski effect to gap-state absorption in hydrogenated amorphous silicon.** N.M.Amer, A.Skumanich (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), W.B.Jackson.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.897-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The contribution of light-induced conductivity and luminescence changes to gap-state absorption in a-Si:H was directly measured by photothermal deflection spectroscopy. The authors show that sample illumination enhances gap-state absorption while annealing restores its magnitude to the original level. Furthermore, they find that doping further enhances this absorption while compensation results in the smallest observed effect. They determine the energy position of the affected states to be 1.2-1.3 eV below the conduction band and tentatively attribute the enhancement to Si dangling bonds created by breaking the Si-Si bonds. (10 refs.)

68262 **Modulation-spectroscopy study of the $Ga_{1-x}Al_xSb$ band structure.** C.Alibert, A.Joullie, A.M.Joullie (Equipe de Microoptoelectronique de Montpellier, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Phys. Rev. B (USA), vol.27, no.8, p.4946-54 (15 April 1983).
The authors report a detailed study of the $Ga_{1-x}Al_xSb$ band structure over the entire composition range. They have determined the energies, as a function of temperature, at which the direct transitions $\Gamma_8{}^v\rightarrow\Gamma_6{}^c(E_0)$, $\Gamma_7{}^v\rightarrow\Gamma_6{}^c(E_0+\Delta_0)$, $L_{4,5}{}^v\rightarrow L_6{}^c(E_1)$, and $L_6{}^v\rightarrow L_6{}^c(E_1+\Delta_1)$ occur, and those at which the indirect transitions $\Gamma_8{}^v\rightarrow X_6{}^c(E_X)$ and $\Gamma_8{}^v\rightarrow L_6{}^c(E_L)$ occur. A simple physical model is proposed to explain the experimental values of the E_0, Δ_0, E_1, Δ_1 bowing parameters. A detailed comparison is made between their results and previously reported ones. (34 refs.)

68263 **Empirically derived formula for the energies of the first ultraviolet absorption maxima of 20 alkali-halide crystals.** T.O.Woodruff (Scuola Normale Superiore, Pisa, Italy).
Solid State Commun. (USA), vol.46, no.2, p.139-42 (April 1983).
Hilsch and Pohl noted long ago (1928-30) that the energy of the first ultraviolet absorption maximum in an alkali halide crystal is well approximated by the energy required to transfer an electron from the halide ion to the alkali ion. A more consistent treatment of the Madelung energy by Wolf and Herzfeld (1928) led to a modified form of the Hilsch-Pohl expression which, unfortunately, agreed less well with experiment. In the present work, the electron-transfer model was retained, but a more complete analysis led to a simple formula which is in excellent agreement with most of the present experimental data. That analysis, involving theoretical as well as empirical

considerations, is presented together with a detailed quantitative discussion of ways to choose the single adjustable constant determining the two parameters entering the formula. Two such choices were considered; the results of applying each to the twenty alkali halide crystals which can be made from Li, Na, K, Rb, Cs as cations and F, Cl, Br, I as anions are tabulated. With the more successful of the two methods, the data for six of the crystals are reproduced by the formula with an accuracy of one millihartree (0.037 eV) or better; for eleven of the other crystals, to within less than 0.4 eV. For the remaining three (NaF, CsCl and CsI), the error is less than 0.6 eV. The second of the two methods for adjusting the single constant led to a reasonable fit in all 20 cases (f.c.c. and s.c.). (8 refs.)

68264 Influence of temperature on the effects arising from the spatial dispersion of $CdGa_2S_4$ crystals. L.M.Suslikov, Z.P.Gad'mashi, V.Yu.Slivka (State Univ., Uzhgorod, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1262-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1955-8 (Nov. 1982). [received: April 1983]
The long-wavelength fundamental absorption edge of cadmium thiogallate ($CdGa_2S_4$) single crystals was investigated in the $E \| c$ and $e \perp c$ polarizations of the incident light at temperatures in the range 77-380K. The temperature-dependent manifestations of the spatial dispersion of the permittivity of these crystals were analyzed. The relationship between these manifestations and the thermal shifts of the energy levels Γ_3 and $\Gamma_2+\Gamma_4$ at the top of the valence band of cadmium thiogallate was considered. (17 refs.)

68265 Optical properties of $TlInS_2$ single crystals near the fundamental absorption edge. G.I.Abutalybov, S.G.Abdullaeva, N.M.Zeinalov (Radiation Res. Section, Acad. of Sci., Baku, Azerbaidzhan SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1348-9 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2086-8 (Nov. 1982). [received: April 1983]
Single crystals of $TlInS_2$, which belong to the class of chalcogenide semiconductors with the general formula $T1^+(In^{3+}S_2)^-$, were grown by us using the Bridgeman-Stockbarger method is evacuated quartz ampules with different shapes of the bottom of the ampule. The absorption spectra of $TlInS_2$ single crystals were investigated near the fundamental edge using a grating monochromator by a static method, as well as by the λ-modulation method. (8 refs.)

68266 Role of the excitonic intermediate resonance in two-photon spectroscopy of CdS crystals. R.Baltrameyunas, Yu.Vaitkus, V.Gavryushin (V. Kapsukas State Univ., Vil'nius, Lithuanian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1637-40 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2888-93 (Oct. 1982). [received: April 1983]
The spectral properties of two-photon absorption (TPA) in CdS single crystals have been studied under conditions which are free of the effects of accompanying incoherent nonlinear phenomena. Special attention was given to TPA spectra at short wavelengths where resonant features with peculiar polarization and temperature dependences were observed at low temperatures. It is shown that these features are explained by resonant amplification of the intrinsic TPA when one of the two absorbed photons enters into a resonance with an exciton-like state. (23 refs.)

78.45 STIMULATED EMISSION

(see also 42.65C in nonlinear optics)

68267 Magnetically tunable stimulated emission with recombination radiation in (Cd,Mn)Se. D.Ehiman (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.775-6 (1 May 1983).
Stimulated emission of near-band-gap radiation is observed in the semimagnetic semiconductor $Cd_{1-x}Mn_xSe$ $x=0.1$. Excitation was achieved by optical pumping just below the absorption edge. The photon energy of the recombination emission is a strong function of both magnetic field and temperature. With increasing field, the emission shifts to lower energy. The shift is primarily proportional to the Mn^{++} magnetization and at high fields at approximately 60 meV. The magnitude is in reasonable agreement with that expected from the exchange energies. (9 refs.)

68268 Generation of stimulated emission in a concentrated barium-erbium double-fluoride crystal. A.M.Tkachuk, M.V.Petrov, I.G.Podkolzina, T.S.Semenova.
Opt. & Spectrosc. (USA), vol.53, no.3, p.235-6 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.396-9 (Sept. 1982). [received: May 1983]
Reports on low-temperature lasing by concentrated $BaEr_2F_8$ crystals on the ${}^4S_{3/2} \rightarrow {}^4I_j$ ($j={}^9/_2, {}^{11}/_2, {}^{13}/_2$) transitions. The $BaEr_2F_8$ crystals were grown by the Czochralski method and are isostructured to the BaY_2F_8 crystal. The lasing wavelengths, the values of the pumping-energy thresholds, and the temperature and duration of the pumping pulse are given according to the data of Ivanova et al. (1981). The temperature dependence of the pumping-energy threshold for the lasing lines at 0.8538, 1.2312, and 1.7350 μm is shown. These lines correspond to transitions from the lower Stark component of the ${}^4S_{3/2}$ term to components of the Stark splitting of the ${}^4I_{13/2}$, ${}^4I_{11/2}$, and ${}^4I_{9/2}$ terms, respectively. During flash-lamp pumping of the $BaEr_2F_8$ crystal the energy threshold for all the lines depends strongly on the temperature. (11 refs.)

68269 The experimental and theoretical investigation of the hot hole population inversion and far IR radiation generation in p-Ge under $E \perp B$ fields. J.K.Pozela, E.V.Starikov, P.N.Shiktorov (Inst. of Semiconductor Phys., Acad. of Sci., Vilnius, USSR), L.E.Vorobjev, F.I.Osokin, V.E.Stafeev, V.N.Tulupenko.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.226-8 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The relative inversion of the distribution function of the light (l) holes with respect to the heavy (h) holes for the energy range corresponding to the direct optical transitions between l-h bands in p-Ge have been investigated in crossed electric and magnetic fields both experimentally and theoretically. The far infrared radiation ($\lambda=100$ μm) generation in p-Ge under T=10-80K was experimentally discovered. (8 refs.)

68270 Population inversion and far IR emission of hot holes in Ge in crossed electric and magnetic fields. A.P.Chebotarev (Lebedev Phys. Inst., Moscow, USSR), V.N.Murzin, S.A.Stoklitsky, Yu.L.Ivanov, Yu.B.Vasiliev, A.A.Andronov, M.D.Chernobrovtseva, V.I.Gavrilenko, V.A.Kozlov, Z.F.Krasilnik, L.S.Mazov, I.M.Nefedov, Yu.N.Nozdrin, V.N.Shastin.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.229-31 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The extensive investigations of hot holes population inversion and the possibility of FIR laser action in Ge in crossed electric E and magnetic H fields are given via observation of FIR luminescence and the Monte-Carlo simulation. It is demonstrated that the light-heavy hole intersubband inversion is sustained in doped samples providing the hole amplification coefficient up to ten percent per centimeter. (8 refs.)

78.50 IMPURITY AND DEFECT ABSORPTION IN SOLIDS

68271 Structure of the short-wave edge of the lattice absorption band in zinc selenide doped with aluminum. M.P.Kulakov (Inst. of Solid State Phys., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.749-52 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.895-8 (June 1982). [received: Feb. 1983]
A group of absorption bands related to doubled frequencies of local vibrations due to defects in the zinc selenide lattice that are associated with the presence of aluminum is observed in the $(500\text{-}800)\times10^2$ m^{-1} range. The contribution of this absorption mechanism near $\lambda=10.6\times10^{-6}$ m with respect to this order of magnitude does not exceed the multiphonon absorption by the lattice for $[Al]\leq10^{23}$ m^{-3}. (7 refs.)

68272 Quasilocal states in indium-activated alkali-halide crystals. V.P.Danilov, V.I.Zhekov, T.M.Murina, L.E.Nagli, A.M.Prokhorov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.231-3 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.187-9 (20 Sept. 1982). [received: April 1983]
Two-step spectroscopy is used to observe absorption from the lower excited state of In^+ ions in alkali-halide crystals. This absorption is attributed to the

presence of quasilocal states of the activator in the conduction band of the crystal. The positions of the quasilocal levels relative to the ground state are estimated. (10 refs.)

68273 **Action of ionizing radiation on the IR absorption spectra of NaF and LiF crystals.** L.F.Vorozheikina.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.828-30 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.122-5 (July 1982). [received: March 1983]
Crystals were γ irradiated to doses of 10^5-10^7 R. IR transmission spectra were measured using an IKS-29 spectrometer at room temperature. No changes in the IR transmission of LiF and NaF crystals resulted from γ irradiation up to a dose of 10^5 R. With an increase in the γ-irradiation dose, observation of the IR transmission spectrum of LiF crystals revealed a decrease in intensity, right up to complete extinction, of the band at 3720 cm^{-1} due to free OH$^-$ ions, and of bands in the region 3680-3570 cm^{-1} due to complexes of OH$^-$ with divalent cationic impurity. (13 refs.)

68274 **Spectroscopic properties of transition elements in glasses of geological interest.** G.Calas (Lab. de Mineralogie-Cristallographie, CNRS, Univ. de Paris, Paris, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.311-14 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Geochemical behaviour of transition metal ions can be partly explained at the light of their crystallochemical properties in silicate melts. Different kinds of elements can be distinguished, when studying the dependence of spectral properties on glass bulk composition, stable complex formation and exotic valencies. (4 refs.)

68275 **Bromine cluster centers in irradiated doped KBr crystals.** A.K.Kauletbekova, R.I.Gindina, A.A.Elango.
Opt. & Spectrosc. (USA), vol.53, no.3, p.323-4 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.548-9 (Sept. 1982). [received: May 1983]
When KBr is irradiated at temperatures above 200K, the formation of Br_3^- centers is accompanied by the formation of some larger halogen clusters, which absorb in the 5.0-6.0-eV region. In KBr with Li, Na, Sr, and Ca impurities—in contrast with pure KBr, in which the bands which appear are broad and diffuse—the authors observed some intense bands with a peak near 5.5 eV and a halfwidth of 0.5 eV, which remained thermally stable up to 400K. Since *I* centers and defects that include *I* centers absorb along with halogen clusters in this part of the spectrum in bromides, it is not possible to interpret unambiguously the 5.5-eV band on the sole nature of its spectral position. The authors accordingly studied the properties of the centers responsible for the 5.5-eV band in doped KBr. The properties agree well with the interpretation that the bands at 5.5 eV result from formation of clusters of bromine. This agreement indicates that the Br_e^- and the 5.5-eV centers are made of the same material, and the dependence of the irradiation temperature implies that the degree of association of the halogen is greater than for Br_3^-. (6 refs.)

68276 **Fano resonances in sulfur, selenium and tellurium doped silicon.** E.Janzen, R.Stedman, H.G.Grimmeiss (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.125-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
There are structures above the ionization edge in sulfur, selenium or tellurium doped silicon, which can be interpreted as Fano resonances. The interacting processes are a no-phonon transition to the continuum and the transition to a bound excited state accompanied by emission of an intervalley phonon. The binding energies of the 1s(E) and 2s(A_1) states are determined. (7 refs.)

68277 **Far-infrared magneto-dynamics of photoexcited electron system in gallium arsenide.** T.Ohyama (Dept. of Phys., Osaka Univ., Osaka, Japan).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.131-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
First time-resolved far-infrared laser cyclotron resonance and impurity Zeeman absorption (84, 119, 172, 220 μm) in GaAs under intrinsic photoexcitation and electric field excitation expose various new features of the photoexcited conduction electrons as well as the photo-neutralized impurities at liquid helium temperatures. (8 refs.)

68278 **Derivative absorption spectroscopy of GaAs:Cr.** R.Braunstein (Phys. Dept., Univ. of California, Los Angeles, CA, USA), R.K.Kim, D.Matthews, M.Braunstein.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.163-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Infrared wavelength modulation measurements at 300K in the spectral range 0.5-1.4 eV on semi-insulating n and p-type Cr doped GaAs have revealed extensive fine structure with variations in absorption coefficient $\Delta K \sim 10^{-1}$-10^{-2} cm^{-1} out of a relatively smoothly varying background absorption of 1-2 cm^{-1}. These results can be interpreted in terms of transitions from (Cr^{3+}-Cr^{2+}) to the valence and conduction bands and excited states. (6 refs.)

68279 **Zeeman spectroscopy of cobalt doped InP.** M.S.Skolnick (Royal Signals & Radar Establ., Great Malvern, England), Ch.Uihlein, H.Krath.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.170-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The 785.8 MeV crystal field $^4A_2(F)$-$^4T_1(F)$ transition of Co^{2+} in InP is studied in magnetic fields from 0 to 10 T. Clear C_{3V} axial symmetry is found and is attributed to a strong dynamic Jahn-Teller effect in the $^4T_1(F)$ excited state. A ground state g-value of 2.10±0.10 and excited state g-values of $g_\parallel = 0.96 \pm 0.05$, $g_\perp = 3.76 \pm 0.05$ are found. (10 refs.)

68280 **Compensation mechanism in Ni-diffused n-type GaP [optical absorption spectra].** J.M.Baranowski, M.Jezewski, Z.Liro (Inst. of Experimental Phys., Univ. of Warsaw, Warsaw, Poland).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.179-81 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Optical investigation of the diffusion profile of Ni acceptor in n-type GaP is presented. It is found that a single Ni impurity atom is responsible for compensation of 4 to 5 electrons from shallow donors. Generation of point defects, such as vacancies, by a dislocation climb mechanism is responsible for this large compensation. (10 refs.)

68281 **Infrared spectroscopy of amorphous hydrogenated GaAs, GaP, GaSb, evidence for Ga-H-Ga bridges.** Z.P.Wang, L.Ley, M.Gardona (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.968-70 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The infrared absorption spectra of hydrogenated amorphous GaAs show two prominent hydrogen related bands at 530 cm^{-1} and 1460 cm^{-1}. These bands are very broad and they amount to most of the hydrogen-induced infrared absorption. The remaining structures are a number of comparatively sharp lines due to Ga-H and As-H modes in partial agreement with earlier investigations. The authors argue that the broad bands arise from near-stretching (1460 cm^{-1}) and from wagging (530 cm^{-1}) vibrations of H atoms situated in bridging positions between two Ga atoms. This assignment is supported by similar bands in Al-H polymers, a-GaP:H, and a-GaSb:H. A model calculation of the mode frequencies is also presented. (5 refs.)

68282 **Additional structure in infrared excitation spectra of group-III acceptors in silicon.** D.W.Fischer, J.J.Rome (US Air Force Wright Aeronaut. Labs., Wright-Patterson Air Force Base, OH, USA).
Phys. Rev. B (USA), vol.27, no.8, p.4826-32 (15 April 1983).
High-resolution infrared $p_{3/2}$ and $p_{1/2}$ excitation spectra are reported for the group-III acceptors boron, aluminum, gallium, and indium in silicon. New lines, which are believed to be due to previously unresolved excited states, are observed in the $p_{3/2}$ spectra. A $5p'$ line is observed for the first time in the gallium spectrum. Some previously reported boron $p_{3/2}$ lines are relabeled to correspond with the other group-III spectra. A feature in each of the $p_{3/2}$ spectra is defined as E_1, the ground-state binding energy. Values measured for E_1 are 44.39, 69.03, 72.73, and 155.58 (±0.02) meV for B, Al, Ga, and In, respectively. The data show more complete correspondence between all the group-III excited-states lines than any previously published. The spin-orbit splitting of the valence bands is experimentally deduced to be 44.00±0.02 meV. (15 refs.)

68283 **Spin-polarization and spin-memory effects in the *F*-center absorption and *F′* conversion of NaI and NaBr crystals.** G.Baldacchini, G.P.Gallerano (Centro Ricerche Energia, Lab. Nazionali di Frascati del Comitato Nazionale, Frascati, Roma, Italy), U.M.Grassano, F.Luty.
Phys. Rev. B (USA), vol.27, no.8, p.5039-45 (15 April 1983).
The low-temperature optical conversion of *F* centers in NaBr and NaI into defects with absorptions at equal or higher energies was studied under magnetic fields up to 80 kG. A strong reduction of the optical conversion was observed under fields giving clear evidence that the reaction product of the conversion is an *F′* center with two electrons in a singlet state, the formation of which becomes forbidden in spin-polarized *F*-center systems. This magnetic field quenching of the *F′* conversion ('Porret-Luty effect'), however, is incomplete even under full spin polarization indicating the existence of some loss mechanisms. The clarify the latter, the authors measured the spin-memory loss during the optical cycle by monitoring the magnetic circular dichroism (MCD) under known pumping conditions, obtaining spin-mixing parameters of $\epsilon = 0.03$ and 0.12 for NaBr and NaI, respectively. These ϵ values can explain only in part the incompleteness of the magnetic field effect, hinting towards the existence of a bound triplet *F′* state. From the MCD measurement, the spin-lattice relaxation time of the *F* ground state as a function of magnetic field and the spin-orbit-splitting parameter Δ of the *F* center were determined too. (18 refs.)

68284 **Absorption spectrum of Cu^{2+} in strontium tartrate tetrahydrate.** V.Somasekhar, K.Purandar, Y.P.Reddy (Dept. of Phys., S.V. Univ., Tirupati, India).
Solid State Commun. (USA), vol.46, no.7, p.569-70 (May 1983).
The absorption spectrum of single crystals of Cu^{2+} in strontium tartrate tetrahydrate, grown from silica gel, is studied at laboratory and liquid nitrogen temperatures. From the analysis of the spectrum, the following crystal field parameters are evaluated; $Dq = 1000$ cm^{-1}, $Ds = 1535$ cm^{-1} and $Dt = 490$ cm^{-1}. (15 refs.)

68285 **Vacuum ultraviolet spectroscopy of high-pressure helium microbubbles in metals.** A.A.Lucas, S.E.Donnelly, J.P.Vigneron (Inst. for Res. in Interface Sci., FNDP, Namur, Belgium), J.C.Rife.
Surf. Sci. (Netherlands), vol.126, no.1-3, p.66-79 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Reviews recent investigations and presents new results on the spectroscopic properties, in the vacuum ultraviolet, of composite materials made of metal containing inert gas bubbles of microscopic size. Three techniques have been used, namely Absorption, Electron Energy Loss and Fluorescence Spectroscopies to study thin film samples. Most of the data presented concern the helium/aluminum composite containing a few at.% of helium. The spectral range explored, between 5 and 30 eV, covers regions where spectral features are assignable either to the metal matrix or to the helium gas. Between 5 and 20 eV, EELS of thin He/Al films reveals, in addition to the usual Al bulk plasmons and Al/Al_2O_3 (boundary) plasmons of the metal film, two new loss continua, in the range 8.5 to 12.5 eV. The first band between 12.5 and 10.5 eV is assigned to spherical bubble plasmons. The assignment of a second, similar broad loss peak between 8.5 and 10.5 eV as being due to oxidized bubble plasmons is still tentative. Between 20 and 25 eV, Absorption Spectroscopy allows detection of the helium resonances line strongly broadened and shifted towards higher energies. The detailed line shape information, interpreted with the help of a theoretical model, gives access to the density and pressure state of the gas in the bubbles. (29 refs.)

78.55 PHOTOLUMINESCENCE

68286 Fluorescence spectra and crystal field analysis of rare earth oxyhalides and oxysulfates doped with trivalent europium and terbium. J.Holsa (Dept. of Chem., Helsinki Univ. of Technol., Espoo, Finland).
Ann. Acad. Sci. Fenn. Ser. AII (Finland), no.196, p.1-58 (1983).
A crystal field analysis of Eu^{3+} doped RE oxyhalides, REOX:Eu^{3+}, (RE=Y, La and Gd; X=Cl, Br and I) and Tb^{3+} doped RE oxychlorides, REOCl:Tb^{3+} (RE=Y, La, and Gd), was conducted on the grounds of the corresponding fluorescence spectra. The sets of CF parameters calculated on the basis set of 49 $^7F_{JM}$ levels reproduce the experimental energy level schemes within RMS deviations of 4-8 cm^{-1}. The strength of the crystal field decreases with decreasing ionic size of the host cation and with increasing ionic size of the host anion. Similar results were obtained for the REOCl:Tb^{3+} series. The evolution of the CF parameter values from REOCl:Eu^{3+} to REOCl:Tb^{3+} is in agreement with the results of an electrostatic point charge calculation and may thus be used to predict the CF effect in other RE^{3+} ions in REOCl. The Racah parameters and the spin-orbit coupling constant were calculated from the REOCl:Eu^{3+} and REOBr:Eu^{3+} excitation spectra. A simultaneous free ion and CF simulation of the excited levels of Eu^{3+} ion using a strongly truncated set of $^{2S+1}L_{JM}$ levels gave poor results unless the free ion wavefunctions were well defined. A descending symmetry method was used to simulate the CF effect in RE oxysulfates doped with Eu^{3+} ions. (82 refs.)

68287 Study on the dependence of donor-acceptor luminescence of $(Zn_{0.85}Cd_{0.15})S$: Cu, Al phosphor on hydrostatic pressure using high-pressure microspectroscopic system. Guo Chang-xin, Zha Chang-sheng (Univ. of Sci. & Technol. of China, Hefei, China).
Acta Phys. Sin. (China), vol.32, no.1, p.139-44 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The dependences of luminescence peak shift and relative emission intensity of $(Zn_{0.85}Cd_{0.15})$ S:Cu, Al phosphor on hydrostatic pressure have been studied at room temperature with a high-pressure microspectroscopic system in conjunction with the gasketed diamond anvil cell, using the methanal ethanal mixture as pressure liquid, the hydrostatic pressure ranging 1 bar-66 kbar was monitored by ruby R-line shift. The emission peak $E(r)$ of $(Zn_{0.85}Cd_{0.15})$S:Cu, Al shift to higher energy with increasing pressure, $dE(r)/dP=4.7$ meV/kbar (38 cm^{-1}/kbar), but less strongly than does the absorption edge of the host. The relative emission intensity decreases strongly with increasing pressure, decreasing by 6% when pressure increasing from 1 bar to 66 kbar. The results can be explained in terms of Al^{3+}-Cu^{+} donor-acceptor pair model. Finally, the authors estimate that $dE_D(Al^{3+})/dP+dE_A(Cu^+)/dP=3.7$ meV/kbar (30 cm^{-1}/kbar). (9 refs.)

68288 Luminescence of products of low-temperature pyrolysis of anthracene. Kh.M.Gafurov.
Vysokomol. Soedin. Ser. B (USSR), vol.25, no.2, p.80-3 (1983). In Russian.
The method and results are given of an investigation of the absorption spectra on luminescence of paramagnetic fractions of the products of thermal treatment of anthracene. The results indicate that low-temperature pyrolysis of anthracine causes the formation of high-molecule homologues, existing in the form of binary radicals. (4 refs.) *A.J.B.*

68289 Optical orientation and exciton alignment in an HgI_2 crystal. R.I.Dzhioev, B.P.Zakharchenya, Yu.G.Kusraev, V.G.Fleisher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.514-16 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.92-4 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
An experimental investigation has been carried out on the optical orientation and alignment of excitons in crystals of red mercury iodide. Tetragonal HgI_2 single crystals were grown from the gaseous phase and were not specially doped. The specimens were cooled down to liquid helium temperatures and were pumped by the krypton laser lines $\lambda=5208$ and 5309 Å along the c axis of the crystal. The emitted luminescence was recorded at a small angle to the c axis, using 'reflection' geometry. (6 refs.)

68290 Magnetic depolarization of hot photoluminescence in gallium arsenide crystals. D.N.Minlin, V.F.Sapega (A.F. Ioffe Physicotech. Inst., Acad. of Sci., USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.517-22 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.95-9 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
The polarization characteristics of hot photoluminescence (HPL) in p-GaAs were investigated. The HPL spectrum of p-GaAs at low temperatures is generated by transitions to the acceptor level by electrons pumping high into the conduction band (electron energy $\epsilon \gg kT$) from the band of heavy or light holes. Under exposure to linearly-polarized light, electrons in the conduction band are found to have an anisotropic momentum distribution. In strong enough magnetic fields H, the cyclotron motion of the electrons produces a rotation of the anisotropic part of the distribution function, provided the direction of H is not parallel to the symmetry axis of the electron momentum distribution. This effect gives rise to additional depolarization of HPL, which is reflected in the more rapid reduction of the linear polarization over the spectrum in a magnetic field. (9 refs.)

68291 Vibronic sidebands in ruby. U.Rothamel, J.Heber (Inst. fur Festkorperphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), W.Grill.
Z. Phys. B (Germany), vol.50, no.4, p.297-304 (1983).
An experimental and group-theoretical study of single phonon vibronic sidebands of the *R*-lines in ruby has been performed. Restrictions in the electron-phonon-spectra due to crystal symmetry occur only in $E \| C$-polarization and for phonons with *k*-vectors zero or parallel to the *C*-axis. An analysis of the fluorescence and excitation spectra led to an identification of part of the lines in the vibronic sidebands with normal modes of the lattice. In the regime of acoustical phonons the intensity of the sideband increases with frequency following a potential law with an exponent of slightly less than 5. A strong enhancement of the vibronic transition probability was found on the high frequency side of the *R*-lines due to a resonance with the electronic transitions $^4A_2$-$^2T_1$. Cross-sections of the vibronic transitions in the spectral range of Stokes- and anti-Stokes-sidebands are given in a diagram. For acoustical phonons with energies up to 6 THz they are also expressed in a formula. (18 refs.)

68292 Photoluminescence of MgO. M.N.Bapat (Dept. of Phys., Univ. of Saugar, Sagar, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.984-5 (Dec. 1982). [received: April 1983]
A luminescence band peaking at 2.2 eV in case of MgO has been observed. The observed emission has been attributed to OH^- surface states and local excess of cations on the surface with similar states of coordination. (11 refs.)

68293 Electronic excited state transport and trapping in disordered systems: picosecond fluorescence mixing, transient grating, and probe pulse experiments. R.J.Dwayne Miller, M.Pierre, M.D.Fayer (Dept. of Chem., Stanford Univ., Stanford, CA, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5138-46 (15 April 1983).
A detailed experimental examination of the dynamics of energy transport and trapping in two component systems, using rhodamine 6 G (R6 G) as the donor and malachite green (MG) as the trap in both glycerol and ethanol solvents, is presented. The experiments were performed using fluorescence mixing and ground state recovery techniques providing temporal resolution of ~50 ps. Samples ranging from high trap-low donor concentrations (the Forster limit) to the opposite regime of high donor and low trap concentrations, were studied. These results were compared with no adjustable parameters to the recent theoretical work of Loring, Andersen, and Fayer (LAF) (1982). The excellent agreement between theory and experiment over the entire donor-trap concentration range confirms the theoretical results of LAF and yields a comprehensive description of excited-state dynamics in solution. A variety of dynamic properties are calculated using the LAF theory and the measured parameters associated with the R6 G-MG system. (30 refs.)

68294 Dynamics of fluorescence quenching in micellar systems [and reply]. P.P.Infelta, M.Gratzel (Inst. de Chimie Phys., Ecole Polytech. Federale, Lausanne, Switzerland).
J. Chem. Phys. (USA), vol.78, no.8, p.5280-2 (15 April 1983).
In M. Tachiya, (1974) Infelta et al. conceived a kinetic model which served to explain the unique features of fluorescence quenching events in organized assemblies, such as surfactant micelles. The validity of the kinetic equations obtained as well as subsequent modifications were verified by vast experimental studies such as intramicellar excimer formation, electron transfer, triplet-energy transfer, and triplet-triplet annihilation. Subsequent to the publication, another mathematical approach to the problem of luminescence quenching in micellar systems was elaborated by Tachiya (1975) which confirmed Infelta et al. initial result. In a more recent paper by the same author, (Tachiya (1982)) the accusation was raised that the earlier model, though yielding the correct final equation, contained an error in its derivation and for this reason 'was wrong'. Infelta et al. contend with Tachiya's assessment and show that his criticism is unfounded. Tachiya replies to Infelta et al.'s comment by pointing out that even though Infelta et al. obtained the same results, this coincidence does not indicate that their treatment was correct and that it contains logical errors. (9 refs.)

68295 On the nonradiative and radiative decay rates and a modified exponential energy gap law for 4*f*-4*f* transitions in rare-earth ions. J.M.F.Van Dijk, M.F.H.Shuurmans (Philips Res. Labs., Eindhoven, Netherlands).
J. Chem. Phys. (USA), vol.78, no.9, p.5317-23 (1 May 1983).
A modified exponential energy gap law for nonradiative decay has been derived for 4*f*-4*f* transitions where only a few phonons participate in the transition. Its preexponential factor varies by only a factor of 10 for different host materials and is purely electronic in nature. The modified law is the usual law (giving a factor of 10^5 variation) modified by using an energy gap which is effectively two (maximum) photon energies smaller than the energy difference between the initial and the final electronic state. A general relation between the radiative and nonradiative decay rates has been constructed. For 4*f*-4*f* transitions this relation enables one to predict the nonradiative decay rate from a knowledge of the radiative decay rate to within one order of magnitude accuracy. (28 refs.)

68296 Luminescence and energy transfer in Y_2O_3 co-doped with Bi^{3+} and Eu^{3+}. Su Qiang (Changchun Inst. of Appl. Chem., Chinese Acad. of Sci., Changchun, China), C.Barthou, J.P.Denis, F.Pelle, B.Blanzat.
J. Lumin. (Netherlands), vol.28, no.1, p.1-11 (March-April 1983).
The emission spectra and decay times of the Y_2O_3 co-doped with Bi^{3+} and Eu^{3+} have been investigated using site-selective excitation and time-resolved spectroscopy in the temperature range 8-296K. Evidence for an energy transfer from $Eu^{3+}(S_6)$ to $Eu^{3+}(C_2)$ is given. The critical transfer distance $R_0=8.6$ Å was found from the decay curve. (11 refs.)

68297 The impurity-induced luminescence of $RbMnF_3$.
J. Lumin. (Netherlands), vol.28, no.1, p.27-39 (March-April 1983).
The impurity-induced luminescence of $RbMnF_3$ has been studied in the temperature range, 4-120K. Multimagnon sidebands of impurity-induced Mn^{2+} emission lines have been detected spanning the spectral range, 5515-5960 Å. The broad emission bands, which peak at 5750 Å and 6440 Å, have been attributed to phonon-assisted transitions from two impurity-induced Mn^{2+} traps of different depths. Pulsed luminescence measurements indicate that the quenching of the shallow trap emission is by a thermal activation to the El exciton level whereas the quenching of the deeper trap emission is by a multiple phonon decay. The coupling between Mn^{2+} ions is strong enough to support a detectable transfer of excitation between these two traps. The results of this research also include the observation in absorption of the El exciton line and its 1-magnon and possible 2-magnon sidebands. (15 refs.)

68298 Luminescence study of $LiGa_{5-x}Fe_xO_8$. C.McShera, P.J.Colleran, T.J.Glynn, G.F.Imbusch (Phys. Dept., Univ. College, Galway, Ireland), J.P.Remeika.
J. Lumin. (Netherlands), vol.28, no.1, p.41-52 (March-April 1983).
Absorption, excitation, and luminescence measurements are presented for $LiGa_{5-x}Fe_xO_8$ with concentrations *x* from 0.015 to 0.26. The emission and excitation data indicate that the red luminescence observed is due to the $^6A_1(^6S)\leftarrow{}^4T_1(^4G)$ transition in the d^5 configuration for Fe^{3+} in tetrahedral sites. Single-crystal samples allow direct absorption measurements for the first time and these indicate that most of the Fe^{3+} substitutes for Ga^{3+} in octahedral sites. Fine structure in the zero-phonon line and in the sideband is reported. (18 refs.)

68299 Excitation and temperature dependence of the excitonic emissions in undoped and Mg-doped VPE InP. G.S.Pomrenke, Y.S.Park (Avionics Lab., AFWAL/AADR, Wright-Patterson AFB, OH, USA).

J. Lumin. (Netherlands), vol.28, no.1, p.53-63 (March-April 1983).

The photoluminescence of vapor phase epitaxial indium phosphide, both unimplanted and magnesium implanted, is investigated as a function of excitation intensity and temperature to gain a more complete understanding of the free exciton, exciton-bound donor, exciton-bound acceptor (residual and Mg), the 1.4155 eV emission identified with both the recombination of free holes with neutral donors and with bound excitons to ionized donors, and the recently identified 1.4122 eV emission (unique to Mg implanted layers). Emission peak broadening, quenching, and saturation is examined as the irradiance is varied from 0.002 to 33.3 W/cm^2 and the temperature from 2.6 to 50K. The source of the 1.4122 eV emission is speculated to be a donor-acceptor recombination involving a donor center bond to an off-axis band and the Mg acceptor, or more likely, excitons bound to point defects which are created by the acceptor implant. (18 refs.)

68300 Spectroscopic and laser properties of (Pr, La)P_5O_{14} and (Pr, Y)P_5O_{14} crystals. M.Szymanski (Quantum Electronics Lab., Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland).

J. Lumin. (Netherlands), vol.28, no.1, p.87-110 (March-April 1983).

Systematic emission and absorption spectroscopic studies of $Pr_xLa_{1-x}P_5O_{14}$ (for x=1, 0.9, 0.8, 0.7, 0.5, 0.1) and $Pr_xY_{1-x}P_5O_{14}$ (for x=0.75 and 0.5) were performed at 300 and 77K. The structure of Pr^{3+} energetic levels in pentaphosphates was determined for each concentration considered. Numerical values of the most important spectroscopic parameters—the emission cross section, fluorescence quantum yield and branching ratio—determining the laser properties of the compounds investigated, were evaluated. Also, the radiative lifetime and normalized quenching rate values were obtained. (22 refs.)

68301 Luminescence quantum efficiency of Mn^{2+} states in ZnS as studied by photoacoustic spectroscopy. Y.Ohba, M.Mizuta, H.Kukimoto (Imaging Sci. & Engng. Lab., Tokyo Inst. of Technol., Yokohama, Japan).

J. Lumin. (Netherlands), vol.28, no.1, p.111-18 (March-April 1983).

Photoacoustic spectroscopy is employed to determine the luminescence quantum efficiency of Mn^{2+} in ZnS. Three spectra, photoacoustic spectrum, luminescence excitation spectrum and absorption spectrum, are compared. It is observed that the photoacoustic spectrum and the excitation behave complementarily. Radiative quantum efficiencies of the five excited states for Mn^{2+} have been determined. (10 refs.)

68302 Study on optical spectra of Cr^{3+} ions in phosphate, fluorophosphate and fluoride glasses. G.Fuxi, L.Huiming (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).

J. Phys. Colloq. (France), vol.43, no.C-9, p.303-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).

Absorption, fluorescence and lifetime measurements of Cr^{3+}, Mo^{3+} ions in three kinds of glass bases have been performed. Analysis and calculation of the spectral data based on the ligand field theory have been carried out. Furthermore, laser excited and time resolved emission spectra have been studied, spectral characteristics and site structure of Cr^{3+} ion in glasses are also discussed. (7 refs.)

68303 Luminescence of excitons bound by disorder-potential fluctuations in $CdS_{1-x}Se_x$: spatial diffusion, excitation level dependence, and kinetics. V.Agekyan (Inst. of Phys., A.A. Zdanov Univ., Leningrad, USSR), R.Bindemann, R.Schwabe, Yu.Stepanov, I.Streit.

Phys. Status Solidi b (Germany), vol.116, no.1, p.K43-6 (1 March 1983).

The emission spectrum of excitons in $CdS_{1-x}Se_x$ solid solutions has been investigated. The authors report some new features of excitons bound by disorder-potential fluctuations (DPBE) obtained from time-resolved luminescence measurements at different excitation levels. (4 refs.)

68304 Complex isotope splitting of the no-phonon lines associated with exciton decay at a four-lithium-atom isoelectronic centre in silicon. L.Canham, G.Davies, E.C.Lightowlers (Phys. Dept., King's Coll., London, England), G.W.Blackmore.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.119-21 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Isotope substitution studies and uniaxial stress measurements show that the optical centre responsible for the 1.045 eV luminescence system, produced in Li-doped Si by room temperature irradiation damage, may be identified with four Li atoms arranged in a C_{3v} molecular complex. (5 refs.)

68305 Radiative recombination of deep centers in ZnSe:In. E.A.Meneses, G.D.Meneses, P.Motisuke (Inst. de Fisica 'Gleb Wataghin', Univ. Estadual de Campinas, Campinas, Brazil).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.160-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The photoluminescence of In dopped ZnSe is studied under excitation with photon energy less and greater than the band gap energy. In the first case two emission bands A(1.098 eV) and B(2.015 eV) are observed and in the last case, three: A, B and C (2.233 eV). Based C should appear also in the first case since its transition energy is less than the excitation energy. The authors attribute the absence of the C line to the frequency dependence of the optical photoionization cross-section (OPCS) of the deep levels associated with the emission bands. In order to check this assumption they measured the photoluminescence excitation spectra at 77K. This gives the OPCS of the deep levels. The OPCS of band C is quite different from those of bands A and B. The latter are similar to each other and both are well explained by a theoretical model developed by Chantre et al. (1981). (8 refs.)

68306 Evidence for associated deep donor-shallow acceptor pair recombination for the EL2 emission band in GaAs. B.V.Shanabrook, P.B.Klein, S.G.Bishop (Naval Res. Lab., Washington, DC, USA).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.173-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Previous studies have suggested that the EL2 emission band in GaAs arises from an intracenter charge transfer in a complex composed of a deep donor level and its associated near-neighbor acceptor. In the present study, time-resolved photoluminescence measurements have been performed on the EL2 emission band. The position and width of the EL2 emission band are found to be independent of the time elapsed after the exciting laser pulse. This observation is in agreement with the previously mentioned donor-acceptor pair recombination model involving donors and acceptors with a well-defined spatial separation. The authors have also performed photoluminescence fatigue measurements on both the EL2 emission band and a related band at .68 eV. The implications of these measurements for the interpretation of the metastable electronic state of EL2 are discussed. (12 refs.)

68307 Deep level optical spectroscopy of the levels introduced by transition metals in GaAs. F.Litty, P.Leyral, S.Loualiche, A.Nouailhat, G.Guillot (Inst. Nat. des Sci. Appliquees de Lyon, Villeurbanne, France), M.Lannoo.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.182-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

3d transition metals introduce deep states in gaAs and act generally as acceptors. Results of different techniques are sometimes difficult to be bound. Luminescence properties (emission spectra, excitation spectra) of the levels introduced by Fe and V are presented in connection with their electrical characterization; Deep level optical spectroscopy gives the photoionization cross sections $\sigma_n{}^{\circ}$ and $\sigma_p{}^{\circ}$ of each level in the gap. Theoretical models are necessary to extract the physical data from $\sigma_n{}^{\circ}$ and $\sigma_p{}^{\circ}$. A new model is presented taking into account the symmetry of the electronic wave functions. (13 refs.)

68308 General trends in the luminescence properties of transition elements centres in III-V semiconducting compounds. V.S.Vavilov, V.V.Ushakov, A.A.Gippius (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.191-3 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The luminescence of impurity centres—transition elements of I, II and III series with electronic configuration d^{2-4}—has been studied systematically in III-V compounds. The change of properties of a given ion in various matrices (GaAs and GaP) is traced as well as variation in the features of optical transitions in a sequence of electronic configurations $3d^3$-$4d^3$-$5d^3$ (the charge state of impurity ions Me^{2+}). The radiative transitions are identified within the framework of crystal field theory using Tunabe-Sugano diagrams. The interaction of the transitions with phonons is studied. (4 refs.)

68309 Photoluminescence bands related to localized Mn^{2+} transitions in diluted magnetic semiconductors. M.M.Moriwaki, R.Y.Tao, R.R.Galazka, W.M.Becker (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA), J.W.Richardson.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.467-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Photoluminescence excitation measurements have been carried out on the diluted magnetic semiconductors $Cd_{1-x}Mn_xTe$ and $Cd_{1-x}Mn_xSe$. The temperature dependence of the known 2.0 eV and 1.2 eV PL bands is discussed in terms of a configuration coordinate model involving Mn^{2+} intra-ion transitions. Two broad band emissions in $Cd_{1-x}Mn_xSe$, at 2.13 eV and 1.35 eV, are reported which appear to be the analogies to the PL bands seen in $Cd_{1-x}Mn_xTe$. (12 refs.)

68310 Transient, polarized modulated reflection spectroscopy of near bandedge excitations in $Cd_{.70}Mn_{.30}Te$. A.V.Nurmikko, S.Sugai, J.H.Harris (Div. of Engng., Brown Univ., Providence, RI, USA).

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.494-6 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Optically induced changes on subnanosecond timescale in the near normal incidence reflection spectra of semimagnetic $Cd_{1-x}Mn_xTe$ (x=.30) at zero magnetic field have been measured near its fundamental edge in the temperature range of 10 to 50K by sensitive picosecond excite-probe methods. Only part of these spectra show an observable dependence on the sense of circular polarization, but with a strongly temperature dependent decay rate and behavior suggestive of spin relaxation of localized, optically oriented electrons or holes. (9 refs.)

68311 Optical pumping in PbTe epitaxial films. B.Kaufmann, R.J.Nicholas, G.Bauer (Inst. fur Phys., Montanuniv. Leoben, Leoben, Austria), P.Vogl.

Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.505-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

Spin oriented electrons were generated in the many valley semiconductor PbTe by excitation with CO-laser radiation. For the PbTe band-structure, the initial polarization of the photoexcited carriers is calculated and for light propagating parallel to (111), P_i is found to be 0.72. The spectral dependence of the degree of polarization of the photoluminescence radiation was determined and a maximum value of about 10% was obtained. Using the Hanle effect, the 'spin'-relaxation time and the carrier life time were obtained. (12 refs.)

68312 Plasma deposited microcrystalline and amorphous silicon. A comparative study of photoluminescence. P.K.Bhat, G.Diprose, T.M.Searle, I.G.Austin (Dept. of Phys., Univ. of Sheffield, Sheffield, England), P.G.LeCouber, W.E.Spear.

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.917-19 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The photoluminescence (PL) properties of glow discharge μC-Si have been investigated. At low temperatures, the PL spectra show a weak 1.3 eV emission, probably associated with a residual amorphous phase, and a relatively dominant and narrow 0.9 eV band, which the authors attribute to the μC phase. A comparison with a-Si prepared by glow discharge and sputtering suggests that the width of the 0.9 eV defect emission is sensitive to the degree of disorder in these materials. (7 refs.)

68313 Efficient visible luminescence from hydrogenated amorphous silicon. D.J.Wolford, B.A.Scott, J.A.Reimer, J.A.Bradley (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.920-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The authors report on optical structural properties of a new class of efficient visible light emitting semiconductors; low-defect-density a-SiH_x alloys. Films are prepared by HOMOCVD from silane and RF plasma from disilane. Optical gaps increase monotonically with H incorporation and decreasing substrate temperatures (200-25°C), while spin densities remain low. New broadband luminescence develops in the alloy band tails and shifts to higher energies with the gap. At ~40% H, gaps reach 2.55 eV and yellow-orange PL peaks near 2.05 eV. Efficient PL persists at room temperature. Emission is attributed to band-tail excitons and phonon cooperation. (14 refs.)

68314 Picosecond radiative and nonradiative processes in As_2S_3 glass. B.A.Weinstein, T.E.Orlowski (Xerox Webster Res. Center, Rochester, NY, USA), W.H.Knox, T.M.Nordlund.

Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.977-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).

The build-up and decay of band-tail excited photoluminescence (PL) in As_2S_3 glass was measured over 0-300 ps using picosecond laser, jitterfree streak camera techniques. The maximum radiative rate is $\nu_1 \approx 4 \times 10^8$ Hz. Nonradiative processes competing with ν_1 exhibit a T^2-activated temperature dependence similar to the CW quantum efficiency. Different subsets of carriers appear to be involved in PL and photoinduced absorption. (15 refs.)

68315 Luminescence, transient transport and photoconductivity in chalcogenide glasses. K.L.Nagi (Naval Res. Lab., Washington, DC, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.980-2 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
A minimal set of states in chalcogenide glasses is proposed, which in conjunction with a fundamental mechanism can explain the totality of optical and transport data. (18 refs.)

68316 Soliton pair generation in polyacetylene: A lattice relaxation approach. Zhao-bin Su, Lu Yu (Inst. of Theoretical Phys., Acad. of Sinica, Beijing, China).
Phys. Rev. B (USA), vol.27, no.8, p.5199-202 (15 April 1983).
The theory of lattice relaxation and multiphonon process, developed by Huang and others, is generalized in this paper to consider both the radiative and nonradiative transitions between multielectron states, consistent with different symmetry-broken lattice configurations. The probability of the nonradiative decay of electron-hole pairs into soliton pairs and that of an electron (hole) into a polaron, as well as the cross section of soliton-pair photogeneration are calculated explicitly. The selection rules for both radiative and nonradiative transitions, and also the branching ratio of photoinduced neutral to charged solitons, are discussed. The theoretical results obtained are compared with numerical calculations and recent photoconductivity experiment. (16 refs.)

68317 Excimer emission in the isothermal luminescence of γ-irradiated hydrocarbon glasses at 77K. J.Mayer, Szadkowska-Nicze, I.Zuchowicz (Inst. of Appl. Radiation Chem., Tech. Univ., Lodz, Poland).
Radiat. Phys. & Chem. (GB), vol.21, no.4, p.401-3 (1983).
A new method of excimer generation, using the radiation technique, is described. Excimer emission was observed in the isothermal luminescence of hydrocarbon matrices doped with naphthalene, γ-irradiated at 77 K and after annealing at higher temperature. (11 refs.)

68318 Luminescence properties of the iron group ions in ionic crystals. F.Iova (Facultatea de Fizica, Univ. din Bucuresti, Bucuresti, Rumania).
Stud. & Cercet. Fiz. (Rumania), vol.34, no.10, p.927-44 (1982). In Rumanian.
The radiative emission processes and radiationless decay in localized luminescent centres in ionic crystals are reported. The concentration quenching and the temperature dependence of the emission for some particular ions (Cr^{3+}, Ni^{2+}, Mn^{2+}) are discussed. (29 refs.)

68319 Ortho- to para-exciton conversion in Cu_2O: a subnanosecond time-resolved photoluminescence study. J.S.Weiner, N.Caswell, P.Y.Yu (Dept. of Phys., Univ. of California, Berkeley, CA, USA), A.Mysyrowicz.
Solid State Commun. (USA), vol.46, no.2, p.105-8 (April 1983).
The photoluminescence spectra of Cu_2O have been studied as a function of time and temperature. At $T \sim 2.5K$ it was found that the 1s yellow ortho-excitons decay into para-excitons at the rate of $\gtrsim 2.5 \times 10^8$ sec^{-1} while the para-exciton lifetime is much longer and dominated by recombination at defects. As T is raised the rate of conversion of ortho-excitons into para-excitons increases approximately as $T^{3/2}$. None of the existing theories seem to explain this temperature dependence satisfactorily. (13 refs.)

68320 Decay scheme of 310 and 380 nm emission bands in NaCl:Pb system. R.Capelletti, U.Emiliani, J.Garcia Sole, M.Manfredi (Istituto di Fisica, Univ. di Parma, Parma, Italy).
Solid State Commun. (USA), vol.46, no.7, p.531-6 (May 1983).
Lifetime measurements have been performed on 310 and 380 nm emission bands present in the $NaCl:Pb^{2+}$ system. The results reveal complicated behaviour in the 310 nm band, present in quenched samples, showing three slopes in the time decay spectra, while for the 380 nm band only one temperature dependent lifetime is present. Time resolved spectra at LNT and the behaviour of the emission bands intensity vs temperature are reported. The results are discussed on the basis of a configuration coordinate scheme. (16 refs.)

68321 Photoluminescence of cis- and trans-polyacetylene. K.Yoshino, S.Hayashi, Y.Inuishi, K.Hattori, Y.Watanabe (Faculty of Engng., Osaka Univ., Osaka, Japan).
Solid State Commun. (USA), vol.46, no.7, p.583-5 (May 1983).
The emission intensity in cis-$(CH)_x$ increases a little and the emission peak shifts a little to shorter wavelength with increasing temperature, which can be interpreted by the distribution of several emission centers in energy. Photoluminescence is also observed in trans-$(CH)_x$ at around 1.03 μm for the first time. (11 refs.)

68322 Influence of the state of the surface on the low-temperature luminescence spectra of strongly excited ZnTe crystals. P.G.Lukashevich, V.A.Ivanov, M.A.Katibnikov (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1285-7 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1992-5 (Nov. 1982). [received: April 1983]
The low-temperature luminescence spectra of strongly excited zinc telluride crystals were found to depend on the surface state. The exciton reflection spectra of some crystals had an additional maximum due to the presence of an exciton-free surface layer and the same crystals exhibited at $T \approx 6K$ a flattening of the photoluminescence spectra and the appearance of a luminescence band of a degenerate electron-hole plasma, associated with low values of the diffusion length of excitons near the semiconductor-vacuum interface. The luminescence spectra of those crystals whose spectra had a structure due to surface excitons exhibited a luminescence band associated with the pulling of excitons to the surface and their subsequent condensation into surface electron-hole drops. (17 refs.)

68323 Luminescence of epitaxial gallium arsenide heavily doped with silicon. V.F.Kovalenko, A.V.Prokhorovich (Inst. of Semiconductors, Acad. of Sci., Kiev, Ukranian, SSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1333-4 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2064-5 (Nov. 1982). [received: April 1983]
The authors investigated the luminescence of epitaxial heavily doped and compensated gallium arsenide, and observed a nontrivial dependence of the position of the photoluminescence maximum on the energy of the exciting photons. (4 refs.)

68324 Optical resonance cooling of the nuclear spin system in a semiconductor with an anisotropic *g* factor. Yu.G.Kusraev, E.S.Artemova, R.I.Dzhioev, B.P.Zakharchenya, I.A.Merkulov, V.G.Fleisher (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1533-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2705-8 (Sept. 1982). [received: April 1983]
Optical resonance cooling of the anisotropic spin system of ^{127}I nuclei in an HgI_2 crystal was studied with modulation of the circular polarization of the exciting radiation at NMR frequencies. Resonant changes in the magnetic depolarization were observed in the luminescence of an exciton bound to a neutral acceptor. The resonance frequencies correspond to the splittings of the Zeeman sublevels calculated for nuclei with a strong quadrupole interaction and an electric-field-gradient asymmetry parameter $\eta = 0.49 \pm 005$. (8 refs.)

68325 An investigation of the vibronic frequency distribution function in structurally disordered, solid materials by monochromatic luminescence excitation. O.K.Alimov, T.T.Basiev, Yu.K.Voron'ko (P.N. Lebedev Inst. of Phys., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1700-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3004-7 (Oct. 1982). [received: April 1983]
A method is presented for the spectral determination of vibronic frequencies in an activated medium by analysis of inhomogeneously broadend impurity luminescence spectra during selective laser excitation. (12 refs.)

68326 Luminescence of semiconductors containing charged dislocations. R.A.Vardanyan, G.G.Kirakosyan (Inst. of Solid-State Phys., Acad. of Sci., Chernogolovka, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1709-12 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3020-5 (Oct. 1982). [received: April 1983]
The polarization dependence of the luminescence generated in a semiconductor containing charged dislocations is obtained. The electron-phonon interaction which governs the dependences of the spectrum on the temperature and deformation potential constant is treated by the adiabatic method in the Franck-Condon approximation. (7 refs.)

68327 Impact ionization of exciton states and the Stark effect in pure CdS crystals. M.V.Lebedev, V.G.Lysenko (Inst. of Solid State Phys., Acad. of Sci., Chernogolovka, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1721-3 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3040-4 (Oct. 1982). [received: April 1983]
Extinguishing of exciton and exciton-impurity complex luminescence has been studied under passage of an electric current through crystals of CdS at helium temperatures and electric fields up to 2 kV/cm; the influence of the Stark effect on energy levels of a free exciton has also been demonstrated. Extinguishing of luminescence is explained by impact ionization of free and bound excitons by free carriers. It has been shown that field ionization under experimental conditions is not significant. (7 refs.)

68328 Photoluminescence of epitaxial films of ZnSe on GaAs. G.T.Vilisov, V.V.Nuvar'eva, P.E.Ramazanov (V.D. Kuznetsov Physicotech. Inst., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.618-20 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.42-5 (July 1982). [received: May 1983]
A study is made of the photoluminescence of epitaxial films of ZnSe on GaAs grown by the gas-transport technique in a flow of hydrogen at various epitaxy temperatures and times. Excitation is by ultraviolet light with $\lambda_{ex} = 365$ nm. The photoluminescence spectra of films grown on GaAs and quartz are compared. It is shown that the position of the photoluminescence bands depends on the temperature and duration of growth and also on the degree of crystalline perfection of the ZnSe films. The temperature quenching of the 710-nm (1.7 eV) and 560-nm (2.2 eV) bands indicates that each has two activation energies, suggesting that these bands are donor-acceptor in nature. (8 refs.)

78.60 OTHER LUMINESCENCE SPECTRA AND RADIATIVE RECOMBINATION

(for photoconduction and photovoltaic effects, see 72.40; for photoluminescence, see 78.55)

78.60F Electroluminescence

68329 Characteristics of switching electroluminescence of anthracene crystals. A.N.Makhotenko, V.Yu.Litvinenko.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.784-6 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.68-71 (July 1982). [received: March 1983]
Presents the basic characteristics of EL of anthracene accompanying switching: the emission spectrum under different levels of excitation (injection), current-brightness characteristics, and kinetics of EL and of the current. The spectral measurements were carried out in the stationary regime, while high-voltage rectangular voltage pulses with a duration of tens-hundreds of milliseconds with a repetition frequency of 2-20 Hz were used to study the kinetics. (5 refs.)

68330 Concerning the polarisation of radiation from electroluminescent films of ZnS-Mn in a Fabry-Perot resonator. N.A.Vlasenko, Yu.V.Kopytko, O.N.Koshel', V.S.Pekar.
Kvantovaya Elektron., Kiev (USSR), no.23, p.48-53 (1982). In Russian.
It is shown that at low excitation levels the polarisation characteristics of ZnS-Mn films agree well with the classical theory of a Fabry-Perot resonator taking into account the difference in reflection coefficients of the mirrors and the phase jumps for s- and p-polarisation. Losses in the electroluminescent layers, which determine the width of the interference bands, do not depend on polarisation. Changes in the polarisation characteristics at high excitation levels are discussed. (15 refs.)

78.60H Cathodoluminescence, ionoluminescence

68331 Characterization of luminescence centres in neodymium implanted zinc sulphide. F.J.Bryant, J.H.C.Hogg, P.R.Jaffery (Dept. of Phys., Univ. of Hull, Hull, England).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.595-600 (1983).
Analysis of the cathodoluminescence emission spectra of neodymium implanted cubic single crystal ZnS as a function of cost-implantation annealing temperature has enabled groups of emission lines to be identified as originating from transitions within particular luminescence centres. For each group of lines the wavelength separations yield energy splittings characteristic of the crystal field at the luminescence centre. Comparison of these splittings with values calculated by crystal field theory on the basis of a point charge model with due regard to possible sites of cubic symmetry in ZnS, has allowed two luminescence centres (*A* and *B*) to be identified. Centre *A*, which exists at low annealing temperatures, consists of a Nd^{3+} ion situated interstitially with 4 tetrahedrally disposed nearest neighbour S^{2-} ions. At higher annealing temperatures the emissions from centre *A* were found to decline giving way to those of centre *B*, which analysis shows to be a Nd^{3+} ion situated on a zinc substitutional site. (12 refs.)

68332 A donor-acceptor pair broad band emission in $AgGaS_2$. J.P.Leyris, J.P.Aicardi, S.Soule (Lab. de Phys. du Solide, Univ. de Perpignan, Perpignan, France).
J. Lumin. (Netherlands), vol.28, no.1, p.65-72 (March-April 1983).
The authors interpret a broad band emission of silver thiogallate ($AgGaS_2$) peaked at 1.642 eV with a width of 395 meV. They show that the recombination kinetics are governed by donor-acceptor processes, with the band shape dominated by vibronic interaction. A theoretical calculation of the time-resolved spectra built with the parameters of donor-acceptor transitions gives good agreement with the experimental spectra. (12 refs.)

68333 Cathodoluminescence of natural diamond associated with implanted impurities. V.S.Vavilov, A.A.Gippius, V.A.Dravin, A.M.Zaitsev, B.S.Zhakupbekov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1288-90 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1996-2000 (Nov. 1982). [received: April 1983]
The cathodoluminescence spectra of natural diamond crystals doped by ion implantation exhibited for the first time some lines associated with luminescence centers containing Cr, Ni, Zn, Ag, and Tl. An analysis was made of the nature of these centers. A comparison of the cathodoluminescence spectra of diamond containing implanted Ni with the cathodoluminescence spectra of synthetic crystals showed that the luminescence of the latter was associated with Ni which was used as a catalyst during synthesis. (10 refs.)

78.60K Thermoluminescence

68334 Effects of pre-irradiation and quenching on the low-temperature thermoluminescence of KCl:Sr. M.Jimenez de Castro, J.L.Alvarez Rivas (Junta de Energia Nuclear, Madrid, Spain).
J. Phys. C (GB), vol.16, no.12, p.2375-80 (30 April 1983).
The effect of quenching from 650°C to room temperature as well as that of heavy predoses at room temperature on the thermoluminescence induced by X-irradiation at temperatures between 80 and 300K in KCl:Sr (80 ppm) samples have been investigated. These heavy predoses strongly reduce the glow peaks in the 170-300K range which are clearly related to interstitial centres involving impurity-vacancy dipoles. This result gives additional evidence to support the idea that such dipoles are also involved in the thermoluminescent processes operative above room temperature. The study of quenched samples has revealed the existence of a dipole aggregation process which is induced by irradiation. It is suggested that the energy transfer mechanism is the recombination of the radiation-induced interstitials and vacancies close to the dipoles, either during irradiation or in the thermoluminescence run. (10 refs.)

68335 Glow curves of thermally pre-treated NaCl:Ca crystals. K.N.Reddy, V.H.Babu (Phys. Dept., Osmania Univ., Hyderabad, India).
Radiat. Eff. Lett. (GB), vol.68, no.5, p.145-8 (1983).
Glow curves were recorded for NaCl:Ca crystals subjected to annealing and quenching from elevated temperatures. These specimens were irradiated with X-rays at room temperature using a tungsten target. Samples exhibit certain glow peaks which are observed only in the first thermal cycle. A marked difference in the glow curves pattern for the first and subsequent heating runs has been observed. It is suggested that these changes may be due to the change in the configurational coordinate system of F-centres due to the impurity existing in different states. (2 refs.)

Radiation and spectral characteristics of sapphire crystals produced by various methods .... See Entry 68254

78.60M Sonoluminescence, triboluminescence

68336 Acoustoluminescence spectra of NaCl and KCl crystals. I.V.Ostrovskii, O.A.Korotchenkov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.228-9 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.387-9 (Sept. 1982). [received: May 1983]
The authors have determined the AL spectra of uncolored NaCl and KCl crystals in the visible region. It has also been shown that AL bands are observed in the regions of optical absorption by intrinsic defects of the color-center type. It can be concluded that the influence of electron-phonon interaction on the process of producing acoustoluminescence radiation, is appreciably weaker than on the photoluminescence of color centers. (5 refs.)

78.60P Chemiluminescence

(see also 82.40T Chemiluminescence and chemical laser kinetics)

68337 Thermodynamic treatment of chemiluminescence efficiency. Yu.P.Chukova.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.789-94 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.75-80 (July 1982). [received: March 1983]
A rigorous thermodynamic treatment is presented of the limiting efficiency of chemiluminescence. The reactions which require additional activation and the activationless chemiluminescent reactions are treated separately. (23 refs.)

78.65 OPTICAL PROPERTIES OF THIN FILMS

68338 Optical properties of codeposited aluminum-silicon composite films. G.A.Niklasson, H.G.Craighead (Bell Labs., Holmdel, NJ, USA).
Appl. Opt. (USA), vol.22, no.8, p.1237-40 (15 April 1983).
Aluminum-silicon composite films consisting of a mixture of aluminum and silicon particles were produced by electron-beam coevaporation. The reflectivity of samples with ≲33-vol.% Si was good agreement with the Bruggeman theory with no adjustable parameters. No parallel-band absorption peak due to the aluminum was detected analogously to the behaviour of microcrystalline aluminum films. (20 refs.)

68339 Substrate parameter determination for thin film spectrophotometric measurement correction. M.Matzeu, A.Panatta (Lab. delle Radiazioni, Istituto Superiore di Sanita, Roma, Italy).
Appl. Opt. (USA), vol.22, no.8, p.1247-50 (15 April 1983).
A method of obtaining accurate values for the optical parameters of thin film substrates is described. Calculations for reflected and transmitted fluxes in substrate sets are developed allowing for double reflection. A simple procedure to fit measurements is also illustrated. Values for substrate parameters are extracted and used to correct for substrate influence in thin film spectrophotometric measurements. Corrected thin film measurements and data calculated with obtained optical constants are compared. (5 refs.)

68340 Hard carbon coatings with low optical absorption. B.Dischler, A.Bubenzer, P.Koidl (Fraunhofer-Inst. fur Angewandte Festkorperphys., Freiburg, Germany).
Appl. Phys. Lett. (USA), vol.42, no.8, p.636-8 (15 April 1983).
Hydrogenated amorphous (*a*-C:H) films were prepared by RF-plasma deposition from benzene vapor. Complete optical absorption spectra from the UV to the IR (0.2-20.0 μm) have been measured. The optical gap depends linearly on hydrogen content and E_{opt} can be varied between 0.8 and 1.8 eV. For energies below E_{opt} the films are almost transparent and absorption is especially low in the 2-6-μm region (e.g. $\alpha = 15\ cm^{-1}$ at $\lambda = 2.8\ \mu m$). Sharp C-H stretch absorption bands occur near 3.4 μm, giving insight into the microstructure of the films. A newly reported weak band at 3.03 μm is first

evidence for C-C triple bonds (sp^1 hybridization) in *a*-C:H, where sp^3 (single) and sp^2 (double) C-C bonds dominate. (24 refs.)

68341 Microcrystal silicon film of 1.7 eV optical band gap. P.H.Fang, Peiguang Bai, C.C.Schubert, J.H.Kinnier (Dept. of Phys., Boston Coll., Chestnut Hill, MA, USA).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L149-50 (March 1983).
A prominent optical band gap of 1.7 eV has been observed in microcrystal silicon film prepared in vacuum at a substrate temperature of 625°C by electron beam evaporation. (6 refs.)

68342 Ellipsometric investigation of thin Permalloy films. K.Brudzewski, J.Mendyk, M.Zagorska, K.Conder (Inst. of General Chem. & Inorganic Technol., Warsaw Tech. Univ., Warszawa, Poland).
Electron Technol. (Poland), vol.13, no.1-2, p.111-16 (1980).
Recent developments in thin film magnetic bubble devices have renewed interest in precision measurements of the thickness of films. The authors present an application of the ellipsometric method for measurements of thickness (less than 40 nm) and optical parameters of permalloy thin films. The results of ellipsometrical measurements of Ni-Fe films show that optical constants are dependent on thickness. (8 refs.)

68343 Polarized transmission and ATR studies of drawn polyethylene terephthalate films in the infrared. U.D.Deshpande, G.Thyagarajan (Dept. of Phys., Indian Inst. of Technol., Bombay, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.846-8 (Oct. 1982). [received: April 1983]
Transmission and attenuated total reflection spectra are studied for drawn polethylene terephthalate films with unpolarized and polarized incident light. The films are stretched in definite stages. The dichroic ratios are calculated and the effect of drawing of polethylene terephthalate films on the dichroic ratios of different bands, is studied. The results indicate large variations for perpendicular and parallel bands. Assignments of the bands are more definite with this information. (6 refs.)

68344 Effect of preparation technique and temperature on optical properties of amorphous silicon films. J.M.Berger, B.Yous, J.P.Ferraton, A.Donnadieu (Lab. de Spectroscopie II, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.339-42 (Dec. 1982). In French. [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Optical properties of amorphous silicon films prepared by chemical vapor deposition, glow discharge and RF sputtering were determined from reflectance and transmittance measurements in the energy range 0.5 to 5.5 eV. The measurements were done at various temperatures T_m in the range 95 to 723K. Whatever the deposition technique when T_m becomes higher than T_s (substrate temperature) irreversible variations occur for both optical gap $E_g(T_m)$ and static refractive index $n_o(T_m)$. In the T_m range $n_o(T_m)$ varies linearly with $E_g(T_m)$; the slope of the straight line decreases linearly with hydrogen concentration. Whatever the deposition technique and the manner of incorporation of hydrogen in the Si matrix, hydrogen concentration seems to be the preponderant parameter between static refractive index and optical gap. (6 refs.)

68345 Optical four-wave mixing spectroscopy of PbSe epitaxial layers. H.Pascher (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany), R.Grisar, G.Bauer.
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.398-400 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Optical four-wave mixing of the beams of two CO_2 lasers was used to observe spin-flip Raman transitions in PbSe epitaxial layers. By non resonant mixing of the laser beams in InSb, coherent radiation in the spectral range between the frequencies of the CO and CO_2 laser was generated. With this radiation and additionally some CO laser lines the authors measured in addition magnetooptical interband transitions in the samples. From the spin-flip and the interband data the PbSe bandparameters of the Mitchell and Wallis (1966) $\vec{k}.\vec{p}$ scheme were fitted. The results are in good agreement with cyclotron resonance data which were obtained by Fourier transform spectroscopy. (12 refs.)

68346 Vibrational spectra of defect and allow atom complexes in amorphous silicon films. G.Lucovsky, W.B.Pollard (Dept. of Phys., North Carolina State Univ., Raleigh, NC, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.865-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Provides a structural interpretation for the O-induced IR absorption bands in a-Si:H:O alloys. For films with C(0)~0.1 to 1.0 atomic % and C(H)~5 atomic %, there are three O-related IR features, at 2090 cm^{-1}, 980 cm^{-1} and 780 cm^{-1}. These are all assigned to the local atomic arrangement in which the H and O-atoms are bonded to a common Si-site. The mode at 780 cm^{-1} strongly couples Si-H and Si-O-Si motions and is a unique signature of a particular local geometry. The other two vibrations are decoupled Si-H (2090 cm^{-1}) and Si-O-Si (980 cm^{-1}) stretching motions whose frequencies are determined by near-neighbor induction effects. Substitution of D or F for H changes the degree and character of the coupling, whilst substitution of Cl removes it completely. (7 refs.)

68347 Infrared absorption spectra for B- and P-doped a-Si. S.C.Shen, Q.L.Jue (Shanghai Inst. of Tech. Phys. Acad. Sinica, Shanghai, China).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.868-70 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors have reported previously the intrinsic and the impurity induced spectra of B- and P-doped a-Si(H). They report here the effect of sample isochronal annealing on these spectra. Annealing at ~500C enables them to resolve some of the bands observed previously and thus to assign them to specific vibrational modes. The B-H stretching band, for instance, splits into two at 2475 and 2370 cm^{-1}. They are attributed to B-H_2 and B-H groups, respectively. The broad band of a-Si(H):B centered at 690 cm^{-1} splits into three at 830, 725 and 630 cm^{-1}. They are attributed to Si-B, B-H and Si-H modes. The 640 cm^{-1} band of a-Si(H):P splits into two at 630 and 670 cm^{-1}. They can be assigned to Si-H and P-H wagging modes, respectively. The effective charges of these various modes will be discussed. (12 refs.)

68348 Disorder and optical properties in gallium arsenide. C.Paparoditis, A.Rideau, G.Monnom, P.Gaucherel (Lab. de Phys. de la Matiere Condensee, Univ. de Nice, Nice, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.992-4 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Disorder in thin films of gallium arsenide obtained by molecular beam deposition has been investigated by means of optical spectroscopy above the fundamental gap and vibrational spectroscopy in the reststrahlen region. The gradual evolution from the crystalline to the amorphous state has been studied by following the evolution of reflectance and transmittance spectra in the region of the E_1, E'_0, E_2 transitions as well as TO and LO reflectance spectra. The spectral positions of these optical transitions in the UV range do not change with disorder but decrease selectively and persist for deposition temperatures as low as room temperature. Energy shifts in the LO and TO phonons are correlated with the microcrystalline structure and amorphous state. (6 refs.)

68349 Absorption in hydrogenated amorphous silicon at energies less than the optical band gap. V.S.Vavilov, A.G.Kazanskii, E.P.Milichevich (M.V. Lomonosov State Univ., Moscow, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1324-5 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.2051-3 (Nov. 1982). [received: April 1983]
The authors have investigated the spectral dependence of the absorption coefficient α in the range $h\nu<1.8$ eV by the constant photoresponse method. This method allowed them to find the dependence $\alpha(h\nu)$ by measuring the photoconductivity under conditions when the photocarrier lifetime was independent of the photon energy. In the range $h\nu>1.8$ eV the dependence $\alpha(h\nu)$ was deduced from the transmission spectra. These measurements were made at room temperature on *a*-Si:H films formed as a result of decomposition of a mixture of 4% monosilane with argon in a high-frequency glow discharge. (18 refs.)

68350 Reflection from thin metal films for λ~1 mm. E.A.Vinogradov, V.I.Golovanov, N.A.Irisova, A.B.Latyshev.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.8-11 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.11-15 (1982).
Measures the phases and amplitudes of reflection coefficients of thin metal films for λ~1 mm. The dependences of the reflection coefficients on the angle of incidence and the direction of polarization coincide with the theoretical relations obtained earlier by the impedance method. The impedances of the films obtained by independent reflection and transmission measurements, are equal and real. (2 refs.)

68351 Some properties of reactively sputtered tin lead oxide films. A.Czapla, J.Szczyrbowski, M.Jachimowski (Dept. of Solid State Phys., Inst. of Metall., Acad. of Mining & Metall., Krakow, Poland), H.Boudriot, B.Kubier.
Thin Solid Films (Switzerland), vol.102, no.2, p.123-30 (15 April 1983).
Reactive DC sputtering was used to produce thin oxide films of $Pb_xSn_{1-x}O_2$, where x was in the range from 0 to 0.6. The optical transmission and reflection spectra were measured at wavenumbers between 1.3×10^4 and 3.5×10^4 cm^{-1}. From these data the optical constants, surface roughnesses and thicknesses of films were derived. The results show that the optical constants depend on the composition of the source material used in sputtering. Measurements of the electron energy losses show that, in addition to the basic phase of $Pb_xSn_{1-x}O_2$, the films contain other phases of lead oxides as well as pure lead (for x different from zero). (12 refs.)

68352 An improved method for the determination of the extinction coefficient of thin film materials. J.P.Borgogno, B.Lazarides, P.Roche (Centre d'Etudes des Couches Minces, Domaine Univ. de St. Jerome, Marseille, France).
Thin Solid Films (Switzerland), vol.102, no.3, p.209-20 (22 April 1983).
The determination of the extinction of a material deposited in thim film form is generally made from Wolter's formula using $(R-R')T$. To avoid the measurement of R', we have derived an analogous formula involving only R and T in the term $(1-R-T)/T$. Moreover, this new expression can be used in oblique incidence. (6 refs.)

68353 Thickness dependence of the polar Kerr effect in thin ferromagnetic films. R.Carey, D.M.Newman, B.W.J.Thomas (Dept. of Appl. Phys., Coventry Polytech., Coventry, England).
Thin Solid Films (Switzerland), vol.102, no.3, p.245-9 (22 April 1983).
Using a general scattering matrix approach in the theoretical analysis, the polar Kerr rotation is shown to have a marked dependence on sample thickness when the thickness is less than 60 nm. The polar Kerr rotation is calculated for thin films of iron and cobalt for normal incidence in the wavelength range 400-1400 nm for both unbloomed and bloomed specimens. (12 refs.)

68354 Optical properties of CdTe thin films studied by photothermal deflection spectroscopy. J.G.Mendoza-Alvarez, B.S.H.Royce, F.Sanchez-Sinencio (Appl. Phys. & Materials Lab., Princeton Univ., Princeton, NJ, USA), O.Zelaya-Angel, C.Menezes, R.Triboulet.
Thin Solid Films (Switzerland), vol.102, no.3, p.259-63 (22 April 1983).
Photothermal deflection spectroscopy (PDS) was used to analyze CdTe thin films which are to be used to construct solar cells. CdTe thin films grown on a conducting SnO_2 layer deposited on glass show deviations from a stoichiometric composition due to an excess of tellurium. This nonstoichiometry modifies the absorption spectrum obtained from the PDS measurements. (13 refs.)

68355 The observation on o-P_s annihilation in silica aerogel by combined spectrometer. Zhang Tian-bao, Wang yung-Yu, Zhang Chang-chun (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.1-4 (Jan. 1983). In Chinese.
The yields and energy spectra of the various components of o-P_s annihilation in silica aerogel are observed using the combined spectrometer. It is shown that the processes of P_s formation and annihilation in ultrafine grains of SiO_2 aerogel are basically consistent with the diffusion model, but the grain surface effect can not be neglected. Comparing the Doppler broadening spectra, it is understood that the pick-off process of the longest component possesses a lower annihilation momentum than that of the free positron annihilation. (5 refs.)

78.70C X-ray scattering

68356 X-ray Raman scattering on polycrystalline graphite in the scattering angle range 0-120°. Z.I.Kavogli, D.K.Leventouri, C.N.Koumelis (Phys. Lab., Univ. of Athens, Athens, Greece).
Can. J. Phys. (Canada), vol.61, no.4, p.629-32 (April 1983).
X-ray Raman scattering was studied on polycrystalline graphite for various scattering angles in the range 0-120°. A mosaic graphite spectrometer without collimators and CrKβ radiation were used. The shape of the Raman spectrum depended slightly on the scattering angle. The peak intensity of the Raman line increases with scattering angle but in a different way to that resulting from the calculation of Mizuno and Ohmura (1967). Additional components were observed in the spectrum on both sides of the Raman line. (14 refs.)

68357 Concentration dependence of the Huang scattering intensity of TaH_x alloys. H.Behr, H.Metzger, J.Peisl (Sektion Phys., Univ. Munchen, Munchen, Germany).
J. Phys. F (GB), vol.13, no.5, p.L75-6 (May 1983).
The analysis of the concentration dependence of the Huang diffuse scattering intensity from TaH_x single crystals has been re-evaluated using two quantities recently determined from independent measurements of the Bragg diffraction intensities. The authors now obtain good agreement between experiment and theory. (5 refs.)

68358 Role of intermediate layers in X-ray interference from thin films. V.A.Nachinov, L.G.Eliseenko, V.N.Dostovalov.
Opt. & Spectrosc. (USA), vol.53, no.3, p.321-2 (Sept. 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.3, p.546-8 (Sept. 1982). [received: May 1983]
The presence of an interface inside the layer should affect the θ dependence of $\log[I(\theta)/I_0]$ (I/I_0 is the relative intensity of the beam resulting from specular reflection from the surface, I_0 is the intensity of the incident beam, and θ is the grazing angle). In an effort to determine how important this effect is, the author studied the specular reflection of $FeK_{\alpha 1}(\lambda=1.93597$ Å) radiation from thin aluminum films deposited by thermal evaporation in a $\sim 10^{-6}$-Torr vacuum on fused quartz surfaces that had been polished to an optical finish. The results indicate that interfaces—thin intermediate layers between layers of a homogeneous materal—play a governing role in the X-ray interference from multilayer structures. (9 refs.)

78.70D X-ray absorption and absorption edges

68359 Multiple-scattering effects in EXAFS spectroscopy of oxygen-bridge iron complexes. Possibility of angle determination by EXAFS analysis. Man Sung Co (Dept. of Chem. & Appl. Phys., Stanford Univ., Stanford, CA, USA), W.A.Hendrickson, K.O.Hodgson, S.Doniach.
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1144-50 (9 March 1983).
The Fe-Fe EXAFS in X-ray absorption data measured from a series of 12 oxygen-bridged iron complexes has been analyzed to investigate systematically the effect of intervening atoms on the structural information derived from EXAFS analysis. The series includes dihydroxo- or dialkoxo-bridge dimers and μ-oxo-bridged dimers and trimers. Three major pathways are considered for a photoelectron to travel to and from an absorber A to a scatterer C in a bridge A-B-C system. Pathway I is the direct backscattering from A to C and back. Pathway II is the multiple-scattering path via atom B in either the outgoing or the incoming trip. Pathway III is the multiple-scattering path via atom B in both outgoing and incoming trips. When the A-B-C (as exemplified by Fe-O-Fe) bridging angle is small, e.g. ca. 100°, the three pathways are solvable in the Fourier transform and can be analyzed independently. (23 refs.)

68360 An EXAFS investigation on the effect of cold rolling on copper. S.S.Fang, H.Chen (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
J. Phys. & Chem. Solids (GB), vol.44, no.6, p.521-5 (1983).
An EXAFS study has been performed on annealed and cold-rolled copper foils in order to understand the structural change after deformation. Data taken from a cold-rolled specimen showed nearly identical nearest neighbour structure as compared with an annealed specimen. However, larger Debye-Waller factors and static displacements were observed for atoms in the higher coordination shells. Furthermore, increased disorder in the deformed specimen resulted in a reduced EXAFS amplitude. The determination of the electron mean free path and the effect of specimen non-uniformity on the transmission EXAFS amplitude are also discussed. (7 refs.)

68361 L_{III} X-ray absorption in the light rare earths: Ground-state versus final-state effects. S.Raaen, M.L.denBoer, V.Murgai, R.D.Parks (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5139-41 (15 April 1983).
X-ray L_{III} absorption-edge measurements have been performed on a number of mixed-valent Ce-based systems, along with their La- and Pr-based isomorphs. Contrary to several conjectures, the results imply that the ratio of the integrated intensities of the two edges observed in Ce-based systems is not altered appreciably by final-state effects and hence is a reflection of the 4f ground state. (18 refs.)

68362 Polarization-dependent phase and amplitude interference effects in the $L_{2,3}$ surface extended X-ray absorption fine structure. J.Stohr, R.Jaeger (Corporate Res. Sci. Labs., Exxon Res. & Engng. Co., Linden, NJ, USA).
Phys. Rev. B (USA), vol.27, no.8, p.5146-9 (15 April 1983).
The phase and amplitude of the surface extended X-ray absorption fine structure above L_2 and L_3 edges is shown to be significantly affected by an interference term. This term exhibits a different phase and a different polarization dependence of the amplitude than the leading term (pure $l=2$ final state). Neglect of this term in the data analysis can lead to erroneous determinations of chemisorption sites and distances. (8 refs.)

68363 *L*-edge X-ray absorption resonances in palladium silicides and palladium metal. G.Rossi (Stanford Electronics Labs., Stanford Univ., Stanford, CA, USA), R.Jaeger, J.Stohr, T.Kendelewicz, I.Lindau.
Phys. Rev. B (USA), vol.27, no.8, p.5154-7 (15 April 1983).
The Pd $L_{2,3}$ white line absorption has been measured for Pd metal, Pd_2Si, and PdSi to probe the variations in occupation of the Pd 4d states due to the rehybridization of the d band in the silicides. A reduction of the density of occupied states of d character in Pd_2Si and PdSi with respect to Pd metal is found, in agreement with partial-density-of-states calculations for the hybrid-bonded silicides. (25 refs.)

68364 EXAFS study of $FeCl_3$-doped polyacetylene. H.Kuroda, I.Ikemoto, K.Asakura, H.Ishii (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan), H.Shirakawa, T.Kobayashi, H.Oyanagi, T.Matsushita.
Solid State Commun. (USA), vol.46, no.3, p.235-8 (April 1983).
Fe K absorption spectra of $FeCl_3$-doped polyacetylene $[CH(FeCl_3)_y]_x$ having y values of 0.024, 0.087 and 0.13, were measured by use of synchrotron radiation. The analyses of observed EXAFS data showed that Fe atom is surrounded by about four Cl atoms with Fe-Cl distance of 2.18-2.20 Å. It is concluded that the dopant exists mainly in the form of $FeCl_4^-$, and the following reaction takes place in the $FeCl_3$ doping process: $2FeCl_3+e^- \rightarrow FeCl_4^- + FeCl_2$. (18 refs.)

68365 Role of multielectron excitations in the L_3 XANES of Pd. M.Benfatto, A.Bianconi (Istituto di Fisica, Univ. di Roma, Roma, Italy), I.Davoli, L.Incoccia, S.Mobilio, S.Stizza.
Solid State Commun. (USA), vol.46, no.5, p.367-70 (May 1983).
High resolution L_3 and L_2 XANES (X-ray absorption near edge structure) spectra of Pd metal have been measured at the Frascati synchrotron radiation facility. The L_3 XANES shows an intense 2p→4d 'white line' while at the L_2 a weaker structure appears. A good agreement between L_3 XANES and the one-electron theory of Muller et al. (1982) has been found. All the possible final state effects due to the relaxation of the many body system are discussed. No many body effects have been seen on the 'white line' at threshold. The intensity ratio between L_3 and L_2 absorption is 2.1 in the high energy range of XANES and it is 2.7 at the white line maximum. A weak broad band extending up to 13 eV and centered at ~6 eV above the Fermi level, appearing in the L_3-L_2 difference spectrum, could be tentatively assigned either to the only possible very weak multielectron excitation present in XANES of Pd i.e. the 'two hole-two electron' excited state or to the prevalence of the j=5/2 total angular momentum for electrons in the 5 sp band, hybridized with the 4d band, up to 13 eV above the Fermi level. 68366 X-ray luminescence spectra of A_2B_6 ceramics. A.I.Proskura, V.Ya.Degoda.
J. Appl. Spectrosc. (USA), vol.37, no.1, p.787-9 (July 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.1, p.71-4 (July 1982). [received: March 1983]
Ceramic materials were prepared by the hot pressing method. Specimens were cut in the form of cylindrical disks with a diameter of 14 and thickness of 2 mm. They were placed onto a copper refrigeration line in an evacuated cryostat with beryllium input and quartz output windows. The X-ray luminescence was excited by X-rays from a URS-50 IM apparatus with a chromium anticathode, and the energy of the characteristic X-ray radiation quanta from CR constituted 5.4 keV. The luminescence of the irradiated surface of the specimen was separated by a UM-2 monochrometer with 0.15 mm slits and was detected by FEU-79 and FEU-62 photomultipliers. (4 refs.)

68367 Resonance interaction between high-power ultrashort pulses of light with semiconductors. V.S.Dneprovskii (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Izv. Akad. Nauk SSSR Ser. Fiz., vol.46, no.3, p.586-92 (1982). English translation in: *Bull. Acad. Sci. USSR, Phys. Ser. (USA)*, vol.46, no.3, p.155-61 (1982). (Proceedings of the All-Union Seminar on the Optical Detection of Magnetic Resonances in Solids, Leningrad, USSR, 6-8 April 1981).
Reports an analysis of experimental data obtained in a study of the resonance interaction between powerful ultrashort pulses of light with A_2B_6 semiconductors in the case of one- and two-photon interband transitions and one-photon excitation of excitons. The author investigated the propagation of powerful ultrashort pulses of the first and second ($h\nu$=2.34 eV) harmonics of a neodymium laser (pulse length variable in the range 5×10^{-12}-10^{-9}) during one-photon excitation of excitons and one- and two-photon interband transitions in semiconductors of the form $CdS_{0.75}Se_{0.25}$. He also investigated the propagation of ultrashort pulses from a tunable rhodamine 6G dye laser (passive mode locking, pumped by a lamp) during the excitation of excitons in $CdS_{0.4}Se_{0.6}$ crystals. 79.20F Electron impact: Auger emission

68368 Auger electron spectroscopy of TiO_2:inter- and intra-atomic transitions connected with the valence band. S.Nishigaki (Dept. of Electric & Electronic Engng., Toyohashi Univ. of Technol., Toyohashi, Japan).
Surf. Sci. (Netherlands), vol.125, no.3, p.762-70 (March 1983).
Auger electron spectroscopy was employed as a probe of the valence band density-of-states. Cleaved TiO_2(110) surfaces were annealed, bombarded with Ar ions, and exposed to oxygen. The Ti-LMV Auger spectral shape was changed with various surface treatments. The annealed surface was nearly stoichiometric and exhibited the inter-atomic Auger transition, connected with the valence band originating from the oxygen 2p level, i.e. L(Ti)M(Ti)V(O). The ion bombarded surface, however, showed both inter- and intra-atomic Auger processes, the latter of which, L(Ti)M(Ti)V(Ti), occurred with the titanium 3d level occupied with electrons by oxygen defect formation. (20 refs.)

68369 Auger lineshape analysis. H.H.Madden (Sandia Nat. Labs., Albuquerque, NM, USA).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.80-100 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Auger transitions occurring at solid surfaces give spectra containing information on the energy distribution of valence electrons involved in the transition. Thus Auger electron spectroscopy (AES) can be used as a valence band (VB) spectroscopy that is surface sensitive. Analyses of a number of core-valence-valence (CVV) Auger spectra are reviewed to illustrate the VB information contained in their lineshapes and to indicate current understanding of the physics of the Auger process as it applies to solids. The KVV spectrum from elemental beryllium is an example of a CVV line that can be analyzed simply in terms of the sum of convolution products of independent-particle VB density-of-states (DOS) components. Other elemental solids for which such simple arguments suffice include Al, Si, Li, Ti, Co, and B. The CVV spectra from copper are discussed as examples of CVV lineshapes that are distorted from those expected from simple VB DOS arguments because localization in the two-hole Auger final state for Cu makes hole-hole interactions important in determining the Auger lineshapes. Initial state screening is shown to influence the CVV lineshapes from Be as well as Cu. CVV spectra from the compound surfaces BeO and SiO_2 are analyzed using concepts of interatomic transitions as well as independent-particle VB arguments. These spectra show that AES is a probe of the local DOS about the core-hole site. This ability of AES to give local bonding information is illustrated by analyses of CVV spectra from multi-component surfaces which may be made in terms of the simple superposition of local-bonding signals. Thus the Si-L_{23}VV signal from silicon oxynitride is shown to be the superposition of signals representing elemental Si, Si-H, Si-N and Si-O bonding. (72 refs.)

68370 An investigation of Auger electron signal as a function of sample and detector angles. R.L.Gerlach, R.C.Cargill (Phys. Electronics Div., Perkin-Elmer, Eden Prairie, MN, USA).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.565-8 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The effects of the sample to incident electron beam angle and of the detector angle on the Auger electron signal are important for quantitative Auger analysis, particularly for Auger mapping and line scans. A mean free path model is employed to simulate the Auger signal resulting from a range of sample and detector angles. The model approximates multiple scattering by a normal distribution of ionizing flux angles about the incident beam direction. Experimental observations compare favorably with predictions of the model for Ti and O Auger signals when the model is adjusted to include surface roughness. (6 refs.)

79.20H Electron impact: secondary emission

68371 Polarized secondary electron spectroscopy, a new tool in solid state sciences. M.Erbudak, G.Ravano (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.120-5 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Angle, energy, and spin resolved measurements of secondary electrons (SE) emitted from a gold target are used to gain information on the SE emission phenomenon. The results show that, above the plasma energy, the main SE excitation mechanism is electron-electron scattering. The spin exhange between the primary and secondary electron is determined for such a process. The results also given information on the angular distribution of SE in the solid as a function of their energy. In the transport/escape process, the SE can acquire a spin polarization via spin-orbit coupling in scattering at gold atoms. Such experiments can be used to learn more about the effective scattering potentials and to determine the elastic and inelastic mean free paths of electrons in the solid. (12 refs.)

68372 The effect of surface condition on the structure of the secondary emission spectrum of W(110). O.M.Artamonov, O.M.Smirnov, A.N.Terekhov (A.A. Zhdanov State Univ., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1612-13 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2844-6 (Sept. 1982). [received: April 1983]
The authors have studied the change in the shape of the secondary emission spectrum of a W(110) single crystal surface that occurs during the process of cleaning the surface and as a result of ion bombardment and annealing. The measurements were carried out in a low-energy electron spectrometer. The condition of the surface was checked by parallel measurements of the work function, the characteristics of the Auger spectra, and the energy dependence of the peak of elastically reflected electrons (diffraction effects). 79.20K Other electron impact phenomena

68373 Large-angle electron-energy-loss spectroscopy with the inclusion of a surface image potential. B.M.Hall, S.Y.Tong (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA), D.L.Mills.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1277-80 (25 April 1983).
A full multiple-scattering calculation is reported for large-angle electron-energy-loss spectroscopy of H/W(001) with the inclusion of a surface image potential. The form of the image potential was determined by comparison with experimental data of elastic fine structures on W(001) and confirmed on W(110). With the inclusion of the image potential, good agreement is obtained with experimental data for the polar dependence of the electron-energy-loss cross section. Also, a breakdown of a pseudoselection rule for large-angle electron-energy-loss spectroscopy is illustrated. (9 refs.)

68374 Electron-energy-loss spectroscopy of polydiacetylenes. J.J.Ritsko (Inst. fur Festkorperforschung, KFA, Julich, Julich, Germany), G.Crecelius, J.Fink.
Phys. Rev. B (USA), vol.27, no.8, p.4902-8 (15 April 1983).
Electron-energy-loss spectra in the range 0.2-300 eV were measured for two types of polydiacetylene thin films were different sidegroups: polymers of 2,4-hexadiyn-1-ol and Langmuir-Blodgett films of the pentacosa-10,12-diinoic acid-Cd salt. The valence excitations are dominated by a π-electron plasmon above the 2-eV fundamental absorption edge. The plasmon dispersion is linear with a slope identical to similar plasma excitations in polyacetylene $[(CH)_x]$.

This implies that the π-electron bandwidth and interband exctation spectra are similar in these materials as suggested by recent theoretical band-structure calculations. Absorption begins at 2.0 eV for all momenta even at low temperature, consistent with the dominance of localized excitations at the fundamental edge, thus confirming the interpretation of earlier experimental work. (26 refs.)

68375 A novel technique for the identification of the surface plasmon in EELS. A.A.Ozkok, P.R.Webber, P.J.Dobson (Dept. of Phys., Imperial Coll., London, England).
Solid State Commun. (USA), vol.46, no.2, p.109-11 (April 1983).
In this work the authors report on angle-resolved Electron Energy Loss Spectroscopy (EELS) with grazing-emergent electrons, which has been used to enhance considerably the surface sensitivity of EELS and thus distinguish between surface and bulk-related loss features. Surface plasmon losses for Ni(001) are clearly identified at 7 eV and 14 eV. Also, a new interpretation is suggested for a loss peak observed at 10 eV. (11 refs.)

68376 EELS identification of the adsorbed species from acetone adsorption on Pt(111). N.R.Avery (Div. of Materials Sci., Univ. of Melbourne, Parkville, Victoria, Australia).
Surf. Sci. (Netherlands), vol.125, no.3, p.771-86 (March 1983).
Adsorption of acetone on a clean Pt(111) surface at 120K has been studied by high-resolution EELS and TDS. Two forms of associatively adsorbed acetone have been characterized and their structures determined. The more weakly bound, majority form, desorbs reversibly at 185K ($\Delta H_a \sim 11.6$ kcal mole^{-1}). The EELS spectrum of this species showed a carbonyl stretching band (A_1 symmetry) red shifted by 80 cm^{-1} together with the two B_1 skeletal modes, viz. ν_{as}(CC) and δ(CO), indicating bonding in an end on, through the oxygen, η^1(O) configuration, with the Pt—O—C bent most probably in the molecular plane. This form of adsorbed acetone is the analog of the labile inorganic acetone complexes which are widely exploited in synthesis reactions. The second more strongly bound, minority form of acetone, at 210-230K, partly desorbed molecularly while the remainder decomposed to CO_a, H_a and an adsorbed hydrocarbon residue with the stoichiometry C_2H_x. This form of adsorbed acetone showed no EELS bands due to skeletal modes but instead only bands due to methyl stretching, deformation and rocking modes, indicating side-on bonding in a configuration designated η^2(O,C). Its surface concentration was variable, depending on the region of the crystal surface probed by the EELS beam and consequently is associated with accidental, low-coordination, step sites. By inference, the η^1(O) form is associated with the well defined close packed regions of the ideal Pt(111) surface. (25 refs.)

68377 Low energy electronic and vibronic excitations of semiconductor surfaces. H.Luth (Phys. Inst., Rheinisch-Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.126-46 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The application of high resolution electron energy loss spectroscopy (HRELS) to the study of low energy excitations on semiconductor surfaces is discussed. Besides a short introduction into the scattering mechanism, examples are presented for the excitation of surface phonons and plasmons, intra- and interband scattering as well as for adsorbate vibrations. (42 refs.)

68378 Adsorption site of oxygen chemisorption on Ni(110) at room temperature; an EELS study. A.M.Baro, L.Olle (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.170-6 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The authors use electron energy loss spectroscopy (EELS) to obtain the adsorption sites occupied during the chemisorption of oxygen on Ni(110) at room temperature. Three distinct spectra are observed. For low exposures (≤ 0.1 L) the vibrational spectrum shows two bands at 530 and 800 cm^{-1} which they interpret as due to oxygen adsorbed on a modified long bridge site. Increasing the exposure results in the observation of another band at 700 cm^{-1} which they interpret as due to the occupation of short bridge sites connected with the displacement of nickel atoms to reconstructed positions. Finally, at ~1 L the (2×1) structure is characterized by a vibrational mode at 420 cm^{-1}. These results are interpreted in terms of the missing row reconstruction model, the oxygen atoms populating the long bridge sites of the [001] reconstructed rows. (14 refs.)

68379 Low energy electron inelastic scattering at surfaces: application to Mg(0001) and $(1\bar{1}00)$. I. The clean metal surfaces. J.Ghijsen, P.A.Thiry, J.J.Pireaux, R.Caudano (Lab. de Spectroscopie Electronique, IRIS, FNDP, Namur, Belgium).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.177-82 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Clean (0001) and $(1\bar{1}00)$ faces of magnesium were investigated by Electron Energy Loss spectrometry, in order to study the surface and bulk plasmon intensities as a function of the primary beam energy and the outgoing beam orientation. Strong dependences are observed and tentatively interpreted by use of electron mean free path variation, channeling, and inelastic electron diffraction. (17 refs.)

68380 The electron energy loss spectra of some alkaline earth oxides. A.R.Protheroe, A.Steinbrunn, T.E.Gallon (Dept. of Phys., Univ. of York, Heslington, York, England).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.534-42 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The electron energy loss spectra of CaO, SrO and BaO have been measured in the range 0-50 eV for primary energies between 100-1300 eV. For CaO, comparison with $-\mathrm{Im}(1/\epsilon)$ calculated from optical data shows good agreement except in the region 11-15 eV. The electron energy loss spectra of SrO and BaO show great similarity to the spectrum of CaO. Two surface loss peaks are present in the bulk band gap of CaO and SrO, with a third present at the band edge having a surface contribution. The lowest energy loss peak has been shown to be induced by the electron beam. Barium oxide under electron bombardment differs in the respect that an additional loss peak is produced above the band gap possibly due to the liberation of free barium metal. (12 refs.)

68381 Total current spectra in transmitted and reflected electrons. S.A.Komolov, E.K.Alidzhanov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.93-6 (Feb. 1983). In Russian.
The results of comparative investigation of total current spectrum formation in reflected and transmitted electrons are discussed. It is shown that the fine structure of the spectrum is determined by elastically reflected electrons. Combined measurements of the total current spectrum and Auger spectrum made it possible to control the investigated surfaces. (8 refs.)

68382 Secondary electron spectroscopy study of valence and empty state density in CdS. S.A.Komolov, A.F.Pigulevskii, A.N.Terekhov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.96-9 (Feb. 1983). In Russian.
Two secondary electron emission methods—energy electron loss spectroscopy (EELS) and total current spectroscopy (TCS) are used to study a CdS single crystal. It is shown that the combined application of these methods makes it possible to investigate the characteristic features of the electronic structure of valence and empty state density near the Fermi level. Simultaneous analysis of CdS EELS and TCS spectra shows two maxima of the density energy function present in the empty state at 4.0 and 6.3±0.3 eV above the valence band edge. (6 refs.)

68383 Trapping and reflection coefficients for ^{3}He in Ni at oblique incidence. C.K.Chen, W.Eckstein, B.M.U.Scherzer (Max-Planck-Inst. fur Plasmaphys., EURATOM-Assoc., Garching bei Munchen, Germany).
Appl. Phys. A (Germany), vol.A31, no.1, p.37-44 (May 1983).
The areal density and the depth distribution of ^{3}He trapped in Ni as a function of the bombarding fluence was measured in the energy range of 1-25 keV and at angles of incidence between 0 and 85° using nuclear reaction analysis. At fluences below saturation a linear relation is found between the areal density and the fluence. From its slope the trapping and reflection coefficients can be determined. The experimental data for trapping and reflection coefficients and for the depth profiles were compared with computer simulation results from the TRIM program. To reduce uncertainties in the absolute values of the experimental trapping coefficients, they were normalized to the TRIM values at normal incidence. The dependence of the measured reflection coefficient on the angle of incidence between 0 and 80° shows good agreement with the calculated data for incident energies from 3 to 25 keV, but for 1 keV the measured reflection coefficients are higher than the calculated ones. (21 refs.)

68384 Studies of surfaces of materials using low energy ion beams. I.S.T.Tsong (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1266-70 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Characterization of solid surfaces using low energy, i.e. ≤10 keV, ion beams has gained increasing popularity during the past decade. The three most commonly used low energy ion beam techniques are: secondary ion mass spectrometry (SIMS), sputter-induced photon spectrometry (SIPS) and ion scattering spectrometry (ISS). As far as detection sensitivity is concerned, SIMS is probably superior to almost all surface analytical techniques. Impurity levels in the parts per million range can be easily determined. SIMS is widely applied to semiconductor problems in which concentration-versus-depth information is usually sought. SIPS is especially suited to compositional analysis of non-conducting materials since, unlike techniques based on detection of charged particles, charging of the sample surface by the primary beam does not affect the collection of optical radiation from sputtered excited atoms. ISS is probably the best available technique for studying the composition of the topmost surface layer of any material. Its monolayer sensitivity due to the properties of low energy scattering is unique among surface analytical techniques. This paper discussed the use of each of these three techniques to solve problems in materials science. (16 refs.)

68385 RBS microscopic 'tomography'. R.D.Edge (Phys. Dept., Univ. of South Carolina, Columbia, SC, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1685-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The resolving power of optical and electron microscopes is limited by diffraction, scattering being also a problem with electron microscopes, and ion source properties in the case of ion microprobes. Essentially, the resolution is determined by the hardware. The author has developed a technique involving simple equipment but extensive computer analysis following the taking of data. The profile and internal constitution of periodic surfaces and micro sizes objects is measured by irradiating them uniformly with a parallel beam of ions. The Rutherford backscattered spectra, observed at different angles using solid state detectors, are analyzed in a manner similar to that employed in tomography to yield the structure of the object irradiated. The ultimate resolution is determined by ion straggling, rather than diffraction. (11 refs.)

68386 Sputtering from binary alloys—a technique for evaluating change in surface binding energy. G.W.Reynolds (State Univ. of New York, Albany, NY, USA), T.G.Allas, J.M.Lambert, P.A.Treado.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1749-51 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The authors evaluate the sputtering process from the onset of ion bombardment through the steady state condition. From these experiments models have been proposed for the behavior of the surface composition and the sputtering yields. Techniques developed for monitoring of the surface have provided data supporting the concept that the average surface binding energy of the bombarded target material is sensitive to the sputtering process. Calculating the manner in which the surface binding energy will change with the developing atomic surface fraction can qualitatively lead to more precise prediction of implantation requirements. (14 refs.)

68387 How well does ^{4}He backscattering from low-Z nuclei obey the Rutherford formula?. J.R.MacDonald, J.A.Davies, T.E.Jackman (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada), L.C.Feldman.
J. Appl. Phys. (USA), vol.54, no.4, p.1800-3 (April 1983).
A study of ^{4}He backscattering (150°) cross sections for O, Al, and Si atoms in the energy range 0.6-2.3 MeV has been completed. The authors conclude that the ^{4}He backscattering cross section for these elements follows the E^{-2} energy dependence of Rutherford backscattering to 1%-2% over this energy range. These results have significant implications for the use of ^{4}He backscattering as a materials analysis tool for low-Z elements. (9 refs.)

68388 Simultaneous TOF spectra of sputtered and scattered neutrals and ions from 3 keV Ne$^+$, Ar$^+$, and Ar^{2+} bombardment of CsBr. J.W.Rabalais, J.A.Schultz, R.Kumar, P.T.Murray (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5250-9 (15 April 1983).
A spectrometer system for simultaneous mass and velocity analysis of scattered and sputtered ions and velocity analysis of fast neutrals ejected from a surface by bombardment with a pulsed ion beam is described. Combination secondary ion and scattered neutral plus ion TOF spectra and their corresponding energy spectra for 3 keV Ar$^+$ and Ar^{2+} bombardment of CsBr are presented. Selective sputtering of Brdown to a steady state level is observed with Ne$^+$ bombardment with an estimated depletion cross section of 10 Å ^{2}. Scattering spectra of neutrals plus ions and neutrals alone allow determination of scattered Ar$^+$ ions survival fractions of 0.22 and 0.13 from 3 keV Ar$^+$ collisions with Cs Br, respectively. This indicates preferential neutralization during scattering from Br. Ion fractions for Ar^{2+} and Ar$^+$ are determined for Ar^{2+} scattering, illustrating the stepwise neutralization process for multiply charged ions. With 3 keV Ar^{2+} bombardment the fractions surviving as Ar$^+$ for Cs and Br collisions are 0.18 and 0.08, respectively, while the fraction surviving as Ar^{2+} is $\sim$0.10 for both atomic collisions. The ion fraction data are interpreted in terms of Auger and resonant neutralization transitions between the ion and specific surface atoms. (39 refs.)

68389 Control of silicon dioxide properties by RF sputtering. M.K.Lee, C.Y.Chang, J.S.Tzeng, Y.K.Su (Res. Inst. of Electronics & Electrical Engng., Nat. Cheng Kung Univ., Tainan, Taiwan).
J. Electrochem. Soc. (USA), vol.130, no.3, p.658-62 (March 1983).
Examines the effect of simultaneously sputtered Teflon on the properties of sputtered silicon dioxide films. C-V measurements show that positive ions in sputtered silicon dioxide can be compensated. They also show that the compensation effect can be controlled by the negative voltage of bias sputtering during deposition. (12 refs.)

68390 Comment on 'Molecule formation during sputtering by two-body associative ionization with diabatic curve crossing. C.M.Loxton, I.S.T.Tsong (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA), S.H.Lin, K.Snowdon, W.Heiland.
Phys. Rev. Lett. (USA), vol.50, no.17, p.1331-2 (25 April 1983).
A model for the formation of excited molecular ions has recently been proposed by Snowdon, Heiland, and Taglauer (see ibid., vol.46, p.284, 1981). Experimental evidence for the model is presented with the identification of $N_2{}^+$ molecular emission in the wavelength range 400-430 nm, observed during the bombardment of Si by 0.5 to 6 keV $N_2{}^+$. The purpose of this comment is to demonstrate that these spectral features are those from the SiN $B^2\Sigma$-$X^2\Sigma$ system. (9 refs.)

68391 Diffraction of He atoms from a Xe overlayer adsorbed on graphite (0001). G.Bracco, P.Cantini, A.Glachant, R.Tatarek (Istituto di Sci. Fisiche, Univ. di Genova, Genova, Italy).
Surf. Sci. (Netherlands), vol.125, no.3, p.L81-6 (March 1983).
He beam scattering from a $(\sqrt{3}\times\sqrt{3})$R30° lattice of xenon adsorbed on the graphite (0001) surface is measured. The experimental data at normal incidence, fitted by the hard-wall model and the eikonal approximation, yield a peak-to-peak corrugation amplitude of 0.88 ± 0.02 Å. The agreement is only qualitative and points to the need for a more accurate analysis, with calculations suitable for large corrugation amplitudes. (14 refs.)

68392 Secondary ion yield variations due to cesium implantation in silicon. K.Wittmaack (Gesellschaft fur Strahlen- und Umweltforschung mbH, Phys.-Tech. Abteilung, Neuherberg, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.573-80 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The intensity variations of atomic and molecular secondary ions emitted from cesium-bombarded silicon have been investigated at impact energies between 2 and 12 keV. Accumulation of implanted cesium was found to enhance the Si$^-$ intensity by up to five orders of magnitude. Simultaneously, Cs$^+$ emission is suppressed by more than two orders of magnitude. During cesium implantation the energy distribution of Si$^-$ (Cs$^+$) shifts towards lower (higher) energies. The Si$^-$ (Cs$^+$) intensity increases (decreases) with decreasing impact energy. Measurements involving $Si_n{}^-$ cluster ions suggest that the stationary surface concentration of cesium increases with decreasing impact energy. The observed phenomena are apparently affected by even weak electric fields at the sample surface and by bombardment-induced diffusion. Nevertheless the work function appears to be the key parameter governing both negative and positive secondary ion yields. (22 refs.)

68393 Neutralization of keV ions scattered by Ag(110). A.G.J.de Wit, J.M.van Zoest, J.M.Fluit (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.589-97 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The scattering of 1-6 keV He$^+$, Ne$^+$ and H$_2$O$^+$ ions by Ag(110) was studied. Intensity measurements of singly scattered ions for different azimuthal and polar angles of incidence were combined to photograms of the first surface layers showing their blocking and shadowing behaviour for the different directions. Positive ions show decreasing yields with depth, whereas negative ions show increasing yields with depth (for the first layers). Ratios of the yields for ion scattering by the first and by the second layer are determined for Ne$^+$ ions going along different trajectories between these two layers. The necessity of a locally variable neutralization probability to describe these results is shown. (12 refs.)

68394 Potential emission from tungsten due to impact of slow metastable ions. W.Hofer, W.Vanek, P.Varga, H.Winter (Inst. fur Allgemeine Phys., Tech. Univ. Wien, Vienna, Austria).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.605-9 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Presents energy distributions of secondary electrons emitted from polycrystalline clean and gas-covered tungsten due to impact of slow singly-charged metastable noble gas ions (10-100 eV). The ion deexcitation and neutralization processes are discussed by comparing the authors' experimental results with computed ejected-electron energy distributions using the semi-empirical theory of Hagstrum (1954). Since the potential energy of impinging ions strongly influences the electronic interactions, the ejected-electron energy distribution yields information on the respective initial ion states. This has also been applied for determination of metastable ion beam fractions for some standard ion sources. (6 refs.)

68395 A singularity in the interaction of high-energy singly-charged ions with a nonmetallic crystal surface. I.V.Vorob'eva, Ya.E.Geguzin, V.E.Monastyrenko (Gor'kii State Univ., Kharkov, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1626-7 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2866-7 (Sept. 1982). [received: April 1983]
In studying regularities in the interaction of singly-charged high-energy ions with crystals it is important to determine the nature and magnitude of the energy loss. The authors investigate this aspect of the problem, by irradiating gypsum single crystals ($CaSO_4.2H_2O$) with a $_{54}Xe^{132}$ ion beam. The structure of the irradiated surfaces were examined with an electron microscope using the angle-offset replica method. (3 refs.)

68396 Thermodynamics of ion formation by fast dissipation of energy at solid surfaces. F.R.Krueger (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.385-94 (April 1983).
A fast dissipation of a certain amount of energy at a solid surface, by any mechanism whatsoever, may cause a non-equilibrium phase transition of the surface material forming, nearly instantaneously, a relatively large amount of gaseous molecular and atomic ions. This is a phenomenon common to many techniques utilized to create ions especially from organic solids. The thermodynamics of these processes are deduced from first principles; physical properties (kinetic energy and angular distributions, excitation energy) and chemical properties (ion types, mass spectra and intensities) are derived. Like 'temperature' as an intensive quantity plays a major role in equilibrium thermodynamics, 'action' as an extensive quantity takes the counterpart in this very far-from-equilibrium behaviour. 68397 Two valence states in oxidized europium metal. J.Barth, F.Gerken, J.Schmidt-May (II. Inst. fur Experimentalphys., Univ. Hamburg, Hamburg, Germany), A.Flodstrom, L.I.Johansson.
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.532-6 (22 April 1983).
Evaporated Eu films were exposed to oxygen up to 100 L. Using novel techniques of photoelectron spectroscopy in connection with synchrotron radiation as a tunable light source the authors detect the presence of both Eu^{2+} and Eu^{3+} ions in the sample with a close correspondence to mixed-valence Eu$_3$O$_4$. At elevated temperature (400°C) only Eu^{2+} is found. (20 refs.)

68398 Comment on 'X-ray photoelectron spectroscopic studies of oxygen chemisorption on thick films of photoconducting cadmium sulfide'. M.Lichtensteiger, C.Webb (Coulter Systems Corp., Bedford, MA, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.2127 (April 1983).
For original paper see D.P. Amalnerkar et al., Appl. Phys. Lett., vol.41, p.270 (1982). A recent paper by Amalnerkar, et al. on X-ray photoelectron spectroscopic studies of oxygen chemisorption on thick films of photoconducting cadmium sulfide, is compared and contrasted with literature data and earlier studies by the authors. They find that the interpretation of the XPS($2p$) features by Amalnerkar et al. cannot be correct. The source of confusion is identified as originating from indeterminate stray AlK$_\alpha$ radiation. (7 refs.)

68399 The electronic structure of polyphenyls and poly(p-phenylene). W.K.Ford, C.B.Duke, A.Paton (Xerox Webster Res. Center, Rochester, NY, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4734-42 (1 April 1983).
The ultraviolet photoemission, optical absorption, and core-level shakeup spectra of *p*-phenylene oligomers and poly(*p*-phenylene) are analyzed using the spectroscopically parametrized CNDO/S3 model. The densities of valence states are calculated for these molecules and shown to provide a good description of available photoemission spectra. Photogenerated radical cation states can be delocalized over four or more phenyl moieties in the solid-state oligomers. The relationship between the density of valence states and the energy band structure of macromolecules of poly(*p*-phenylene) is established. The energies of the lowest energy electronic excitations of *p*-phenylene oligomers are evaluated and shown to describe well the available UV absorption and XPS shakeup measurements. The influence of disorder in the solid state is assessed by analysis of the influence of macromolecular conformation on the electronic structure. (44 refs.)

68400 Ionic salt limit in graphite-fluoroarsenate intercalation compounds. J.W.Milliken (Moore School of Electrical Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), J.E.Fischer.
J. Chem. Phys. (USA), vol.78, no.9, p.5800-8 (1 May 1983).
Starting with $C_{8n}AsF_5$ intercalation compounds of stage $n=1$ and 2, the authors have recorded changes with fluorine uptake in basal plane conductivity and its temperature variation, reflectivity and C(1*s*) core level X-ray photoemission spectra. The data are all consistent with an ionic salt limit C_{20}^+ (0.05 electrons per C atom extracted by oxidation) beyond which direct fluorination takes place. Defect scattering from the resulting C-F bond sites is shown to be the conductivity-limiting factor, rather than π charge localization around AsF_6^- sites. The present results also support the authors' previous conclusions that the oxidation of the initial compounds by AsF_5 goes only 40% and 52% to completion for stages 1 and 2, respectively. (40 refs.)

68401 Non linear photoemission from silicon. M.Bensoussan, J.M.Moison (CNET, Bagneux, France).
Physica B & C (Netherlands), vol.117-118 B+C, pt.1, p.404-9 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Two well-defined photoemission regimes are observed from clean (111) Si surfaces under various laser irradiation conditions and photon energies. At low fluences and at photon energies above half the work function two and three quantum process are the outstanding emission mechanisms. Density of state effects of initial and intermediate states appear as the dominant spectral features. At higher fluences or at low photon energies the prevailing emission is thermoemission characterized by a Maxwellian distribution revealing a temperature quite different from the lattice one during the excitation pulse. (21 refs.)

68402 UPS, XPS and Auger spectroscopies of tetrathiotetracene (TTT) and bis (tetrathiotetracene)-triiodide (TTT_2I_3) organic semiconductor surfaces. J.P.Delrue, J.P.Boutique, J.Riga, J.J.Verbist (Lab. de Spectroscopie Electronique, Facultes Univ. Notre-Dame de la Paix, Namur, Belgium), Y.Canivez, L.D.Laude.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.623-5 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Low energy angle integrated photoemission spectra of tetrathiotetracene (TTT) and of the organic molecular complex bis (tetrathiotetracene)-triiodide (TTT_2I_3) are compared to those obtained by X-ray photoelectron spectroscopy. Auger spectroscopy has also been tentatively used to characterize the surfaces of these two samples. (10 refs.)

68403 Exploiting photon energy dependence in photoemission from Si(111)-Mo interface. G.Rossi, I.Abbati, L.Braicovich, I.Lindau, W.E.Spicer, U.del Pennino, S.Nannarone (Stanford Electronics Labs., Stanford, CA, USA).
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.795-7 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
The authors present synchrotron radiation photoemission data from Si(111)-Mo in the coverage range 0.5-20.5 monolayers. Intermixing takes place at room temperature. The energy dependence of 4d photoemission cross section is used to discuss the nature of the chemical bond in the reacted region. (6 refs.)

68404 Photoemission studies of reactive diffusion and localized doping at II-VI compound semiconductor-metal interfaces. L.J.Brillson, C.F.Brucker (Xerox Webster Res. Center, Rochester, NY, USA), N.G.Stoffel, A.Katnani, R.Daniels, G.Margaritondo.
Physica B & C (Netherlands), vol.117-118 B+C, pt.2, p.848-50 (March 1983). (Proceedings of the 16th International Conference on the Physics of Semiconductors, Montpellier, France, 6-10 Sept. 1982).
Soft X-ray photoemission spectroscopy measurements reveal strong differences in chemical bonding and diffusion between II-VI and III-V compound semiconductor-metal interfaces which provide a chemical basis for their systematic differences in Schottky barrier formation. (16 refs.)

68405 Electron-energy distribution in silicon under pulsed-laser excitation. M.Bensoussan, J.M.Moison (Dept. OMT/PMS, CNET, Bagneux, France).
Phys. Rev. B (USA), vol.27, no.8, p.5192-5 (15 April 1983).
By yield and energy-distribution measurements, the authors identify two photoemission regimes from silicon under nanosecond laser irradiation. At low fluence and high photon energy, two- and three-quantum processes are the main emission mechanisms; effects of initial and intermediate states are the dominant spectral features. At high fluence and low photon energy, thermoemission prevails and is characterized by a Maxwellian distribution with a temperature different from that of the lattice during the excitation pulse. (14 refs.)

68406 Photoemission from MBE grown III-V surfaces and interfaces. P.K.Larsen (Philips Res. Labs., Eindhoven, Netherlands), J.F.van der Veen.
Surf. Sci. (Netherlands), vol.126, no.1-3, p.1-19 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Recent theoretical and experimental studies of the electronic and geometrical properties of polar III-V surfaces and interfaces with Group IV elements are reported. Angle resolved photoemission studies using synchrotron radiation and surface sensitive core level photoemission of reconstructed GaAs(001) surfaces prepared by molecular beam epitaxy are treated in some detail and compared with theoretical surface band structure calculations. Interface and heterojunction properties of overlayers of Group IV elements (Pb, Sn and Ge) on the GaAs(001) surface are discussed. (62 refs.)

68407 Angular resolved photoemission of InSb(001) and heteroepitaxial films of α-Sn(001). H.Hochst, I.Hernandez-Calderon (Max-Planck-Inst. fur Festkorperforschung, Stuttgart, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.25-31 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Angular resolved ultraviolet photoemission spectra (ARUPS) of InSb(001) and of heteroepitaxial grown α-Sn(001) films are reported for the first time. Results from normal emission spectra are explained by direct transitions into a parabolic free-electron-like final states band. The experimentally obtained dispersion $E(k)$ along ΓX agrees well with the non-local pseudopotential band structure calculation by Chelikowsky and Cohen (1976). Other band structure calculations of α-Sn exhibiting smaller dispersion of the first valence band towards the X_5 point fail to explain the photoemission data. (17 refs.)

68408 Physisorption on a low work function metal: ARUPS from xenon on cesium. H.H.Rotermund, K.Jacobi (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.32-40 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Angle-rsolved UV photoelectron spectra of Xe physisorbed on Cs films were measured using HeI (21.2 eV) radiation. The Ni(110) cryosurface, onto which the Cs was evaporated, was cooled down to 20K prior to Xe admittance. Physisorbed on bulk Cs, Xe does not change the work function. The relaxation of the Xe 5p photoemission peaks does not differ between the first and second Xe layer. Both results together support strongly the authors' model for the level alignment of physisorbed species. First results of Xe interacting with surfaces covered by submonolayer amounts of Cs are presented. (15 refs.)

68409 XPS and UPS study of Pb monolayers on polycrystalline Pd. D.Chadwick, M.A.Karolewski (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.41-8 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The deposition of up to 10 monolayers of Pb on polycrystalline Pd has been studied by XPS and UPS. Core-level binding energy shifts with coverage are reported. It is found that Pb forms initially a two-dimensional layer, followed by surface alloying at coverages above one monolayer. (21 refs.)

68410 Valence level photoelectron spectroscopy of the oxygen and carbonate species on silver (110). K.C.Prince, A.M.Bradshaw (Fritz-Haber-Inst., Max-Planck-Gesellschaft, Berlin, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.49-57 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
Atomic oxygen, associatively adsorbed oxygen and the carbonate species on Ag(110) have been studied using valence level photoelectron spectroscopy. For the (3×1) atomic oxygen overlayer dispersion of an O-2p-induced feature above the Ag-d band is observed, indicative of adsorbate band formation. In the associatively adsorbed species it appears that the former $1\pi_g$ molecular orbital (a_2+b_1 in C_{2v}) is completely filled as a result of the interaction with the surface. Despite the very strong lowering of the O-O stretching frequency observed in EELS, the $3\sigma_u(a_1)$ orbital is apparently not occupied. The electronic structure of the surface carbonate is shown to be similar to that of a bulk carbonate, confirming the conclusions of Madix (1981). (19 refs.)

68411 Thermal effects in UV photoemission from Cu(110). H.Martensson, C.G.Larsson, P.-O.Nilsson (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.214-18 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The temperature dependence of UV photoemission intensities from Cu(110) was studied in both mirror planes. Strong variations in the temperature dependence was found as the emission angle was changed, in disagreement with simple kinematical theory. These variations are different for different mirror planes, but similar for different d-band peaks in the same mirror plane. These findings raise questions about the importance of the wave-vector in connection with thermal effects. The temperature sensitivity is expected to increase with increasing emission angle due to enhanced surface vibrations, but in the case of emission in the ΓLUX plane the increase was qualitatively reproduced by 'time-reversed LEED' calculations without accounting for enhanced vibrations. The measured thermal sensitivity was however considerably larger than the calculated. (9 refs.)

68412 C(1s) spectroscopy of hydrocarbons adsorbed on Pt(111). N.Freyer, G.Pirug, H.P.Bonzel (Inst. fur Grenzflachenforschung und Vakuumphys., KFA Julich, Julich, Germany).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.487-94 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The temperature dependence of the interaction of C_2H_2 and C_2H_4 with Pt(111) was followed by measurements of the C(1s) binding energy shift. Different surface species, such as previously identified by EELS, UPS and LEED, can be distinguished by their corresponding C(1s) binding energy. At 100K adsorption temperature C_2H_2 and C_2H_4 are characterized by C(1s) binding energies of 284.0 eV and 283.4 eV, respectively. A quantitative evaluation of the C(1s) peak areas yields saturation coverages of about 0.5 molecule per Pt atom for C_2H_2 and C_2H_4 at 100K. The same coverage was also determined for the conditions of the 2×2 LEED patterns. In addition the C(1s) peaks were measured for C_2H_5Cl and C_2H_3Cl on Pt(111) at 110 and 300K. These species adsorb predominantly in molecular form at 110K but are dissociated at 300K. (24 refs.)

68413 Dispersion relation E(k) for s and p bands of gold in the LQW direction. G.A.Katrich, L.S.Miroshnichenko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1650-2 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.2912-15 (Oct. 1982). [received: April 1983]
Photoelectron spectra were studied in gold with a work function decreased by the adsorption of barium monoxide, in the energy range $h\nu \leq 4.1$ eV. Photoelectron emission into the band 'forbidden' in the one-electron approximation was found. Relations $E(k)$ for the *s* and *p* bands, and features of these, were found which differ from the theoretical predictions. The need to take account of many-particle effects in the photoemission process was noted. (9 refs.)

68414 **Regulation of mass transfer in a zinc selenide-hydrogen-inert gas transport system.** L.M.Kulikov (Inst. of Problems in Materials Technol., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.753-6 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.899-903 (June 1982). [received: Feb. 1983]
The use of an inert gas in a mixture with a chemically active transporting carrier gas makes it possible to effectively regulate the rate of deposition of zinc selenide over a wide range; this is particularly valuable in the growth of doped layers or single crystals. In the examined variants of the application of a mixture of inert and chemically active carrier gases the rate of deposition is lower as compared with that for a system with the utilization of a chemically active gas. The chemically active and inert carrier gases may improve the distribution of the rate of growth along the deposition surface and thereby increase the quality of the resulting layers or single crystals of zinc selenide. (6 refs.)

68415 **Preparation and investigation of large single crystals of $Zn_xCd_{1-x}Se$ solid solutions.** L.D.Budennaya, A.I.Nizkova, G.S.Pekar', G.N.Polisskii (Inst. of Semiconductors, Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.760-4 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.908-12 (June 1982). [received: Feb. 1983]
It was shown that the method of 'free growth' from the gas phase makes it possible to obtain large homogeneous single crystals of solid solutions from the components, the pressures of the saturated vapors of which at the growth temperature differ substantially (by several tens of times) from one another. Single crystals of $Zn_xCd_{1-x}Se$ solid solutions ($1 \geq x \geq 0$) with weights up to 200 g, which have a high degree of homogeneity of their characteristics and structural perfection, were grown by this method. (12 refs.)

68416 **The role of the pretreatment of the source material in chemical transport processes; effect of oxygen on growth of ZnS.** W.Palosz (Inst. of Phys., Warsaw Tech. Univ., Warsaw, Poland).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.412-14 (March 1983).
The influence of annealing of the starting material on the mass transport rate in the ZnS:I system is presented. The role of oxygen ($ZnSO_4$) present in the source material in the mass transport rate is discussed. (4 refs.)

68417 **Preparation of lead sulfobromide single crystals.** V.I.Popolitov, Yu.M.Mininzon, A.N.Lobachev (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.7, p.955-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1130-5 (July 1982). [received: Feb. 1983]
A variety of lead hydrosulfite, hydrosulfide/halide, and halide complexes can be formed in the Pb-S-HBr-H_2O system. The concentration of lead, sulfur, and bromine in supersaturated solutions varied depending on the predominance of particular complex and thereby affected the separation sequence and yield of $Pb_7S_2Br_{10}$, $PbBr_2$ and PbS single crystals. The effect of charge composition on the yield and formation sequence of $Pb_7S_2Br_{10}$, $PbBr_2$ and PbS single-crystal phases was examined for the following systems: Pb-S-HBr-H_2O, Pb-S-BR-HBr-H_2O, PbS-Br-HBr-H_2O, PbS-Pb-Br-HBr-H_2O, PbS-Pb-Br-S-HBr-H_2O, $PbBr_2$-PbS-S-HBr-H_2O, and $PbBR_2$-S-HBr-H_2O. The $Pb_7S_2Br_{10}$ single crystals were prepared by separating the charge components in isolated solvents. (8 refs.)

68418 **Evaluation of the spin-up time during the accelerated crucible rotation technique.** A.Horowitz, M.Goldstein (Dept. of Chem., Nuclear Res. Center, Negev, Beersheva, Israel), Y.Horowitz.
J. Cryst. Growth (Netherlands), vol.61, no.2, p.317-22 (March 1983).
The transient flows occurring after a change in the angular velocity of a cylindrical container are described. The dependence of the transient (known as the spin-up or spin-down time) on experimental parameters such as kinematic viscosity, cylinder dimensions and the cylinder's initial and final angular velocities are elucidated by a review of the literature. It is emphasized that with large Rossby numbers the spin-up time is longer and the amount of fluid mixing is greater than with small and moderate Rossby numbers. It is also elucidated that most crystal growth crucibles cannot be considered as infinitely-long cylinders for the evaluation of the fluid dynamics. (16 refs.)

68419 **An analysis of the derivative weight-gain signal from measured crystal shape: implications for diameter control of GaAs.** li, A.S.Jordan, R.Caruso, A.R.von Neida (Bell Labs., Murray Hill, NJ, USA).
Bell Syst. Tech. J. (USA), vol.62, no.2, pt.1, p.477-98 (Feb. 1983).
The authors model a diameter control scheme based on the monitoring of crystal weight for liquid-encapsulated Czochralski (LEC) growth of GaAs. The presence of the B_2O_3 liquid encapsulant and significant capillary forces make the direct interpretation of the weight-gain signal and its time derivative (DWGS) more complicated in comparison with pulled materials such as oxide crystals. The authors formulate a realistic model for the LEC growth of axisymmetric crystals and derive the differential equation relating the time evolution of the DWGS to radius and length. They show that the magnitude of the DWGS at the crystal's 'shoulder' is inversely related to the radius of curvature. (22 refs.)

68420 **On iodine behaviour in bulk crystals of PbTe and SnTe synthesized by the iodide method.** E.P.Trifonova, L.Karagiozov (Sofia Univ., Sofia, Bulgaria).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.315-20 (1983).
In order to explain the peculiar characteristics of iodidely synthesized PbTe and SnTe crystals a model for their interaction with iodine is suggested. It is based on the assumption that PbI and I, respectively SnI, and I, resulting from the PbI_2 (SnI_2) dissociations, are incorporated independently and specifically in the crystals: in PbTe prevails the PbI-incorporation; in SnTe—the incorporation of $I+V_{Sn}$. The difference is connected with the thermodynamic stability of the PbTe and SnTe crystal lattices. (12 refs.)

68421 **Composition control in proton-exchanged $LiNbO_3$.** J.L.Jackel, C.E.Rice, J.J.Veselka (Bell Labs., Holmdel, NJ, USA).
Electron. Lett. (GB), vol.19, no.10, p.387-8 (12 May 1983).
The amount of hydrogen in $Li_{1-x}H_xNbO_3$ layers prepared by proton exchange of $LiNbO_3$ in benzoic acid melts can be limited by adding lithium compounds to the melt. Limiting exchange prevents surface damage, a problem primarily affecting *y*-cut substrates, and reduces scattering in exchanged guides. (4 refs.)

68422 **Experimental study of the temperature distributions in white sapphire single crystals.** Yu.K.Lingart, V.A.Petrov (High-Temperature Inst., Acad. of Sci., USSR).
High Temp. (USA), vol.20, no.4, p.606-12 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.725-32 (July-Aug. 1982). [received: April 1983]
Measurements have been made on the temperature fields (T fields) directly in the growth of single crystals of platy white sapphire. Features of the T-field formation are demonstrate that are related to the partial transparency of the material to the thermal radiation. (13 refs.)

68423 Preparation of TlP_xS_{1-x} and investigation of physicochemical properties. S.S.Sitamov, S.K.Karimov (Kulyab State Pedagogical Inst., Kulyab, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.745-9 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.891-4 (June 1982). [received: Feb. 1983]
A two-temperature synthesis method was used to obtain TlPS, which is greenish gray and has a microhardness of 2×10^9 Pa and a density of 5.6 g/cm^3. Differential-thermal tensimetry, X-ray phase analysis, and microstructure analysis were used in studying solid solutions TlP_xS_{1-x}, and the individuality of existence of the compound TlPS was confirmed. In an investigation of the temperature dependence of the magnetic susceptibility of TlPS in the solid and liquid states, it was shown that this compound has diamagnetic properties and that its transition to the liquid state is of the 'semiconductor-semiconductor' type. (13 refs.)

68424 Synthesis of chalocgenides with the composition $A^I_2B^{VI}$ and crystal structure of Rb_2Te_3 and Cs_2Te_3. K.A.Chuntonov, A.N.Orlov, S.P.Yatsenko, Yu.N.Grin', L.D.Miroshnikova (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.941-3 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1113-16 (July 1982). [received: Feb. 1983]
Single crystals of Rb_2Te_3, Rb_2Se_3, Cs_2Te_3, and Cs_2Se_3 were grown by the Bridgman-Stockbarger method. The crystal structures of Rb_2Te_3, Rb_2Se_3, and Cs_2Te_3 were decoded on the basis of data obtained for powders and single crystals. The first compound crystallizes in a structure of the K_2Te_3 type, while the remaining compounds have the K_2S_3 structure. (6 refs.)

68425 Preparation of strontium tellurite single crystals. A.M.Antonenko, A.Yu.Kudzin, L.Ya.Sadovskaya (Dnepropetrovsk State Univ., Dnepropetrovsk, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1022-4 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1213-16 (July 1982). [received: Feb. 1983]
The amount of tellurates formed during the growing of strontium tellurite crystals is insignificant. Owing to the high volatility of tellurium dioxide the crystals grow in an atmosphere of TeO_2 vapor. Since the existence of a phase transition at 1293K complicates the crystallization the optimum composition of the initial charge for preparing $SrTeO_3$ crystals is one containing a 20% excess of paratellurate. (10 refs.)

68426 Bridgman growth of Rb_2MnCl_4 via accelerated crucible rotation technique. A.Horowitz, D.Gazit, J.Makovsky (Nuclear Res. Center Negev, Beersheva, Israel), L.Ben-Dor.
J. Cryst. Growth (Netherlands), vol.61, no.2, p.323-8 (March 1983).
The Accelerated Crucible Rotation Technique (ACRT) was applied to the Bridgman growth of incongruently melting Rb_2MnCl_4 from non-stoichiometric melts. ACRT mixing allowed the increase of the crystal growth rates by a factor of four compared to the maximum growth rate, in order to obtain inclusion-free crystals, without stirring. The existing analytical data do not allow a prediction of the optimum ACRT parameters and it is possible that even higher growth rates could still be achieved. The ACRT-induced changes of the fluid flow velocity past the growing face and of the thickness of the diffusion boundary layer were calculated. (15 refs.)

68427 Heat transfer analysis of the Bridgman-Stockbarger configuration for crystal growth. I. Analytical treatment of the axial temperature profile. T.Jasinski, W.M.Rohsenow (Dept. of Mech. Engng., MIT, Cambridge, MA, USA), A.F.Witt.
J. Cryst. Growth (Netherlands), vol.61, no.2, p.339-54 (March 1983).
An analytical approach describing the heat transfer during crystal growth in a Bridgman-Stockbarger configuration has been developed. All first order effects on the axial temperature distribution in a solidifying charge are treated on the basis of a one-dimensional model whose validity could be verified through comparison with a published finite difference analysis of a two-dimensional model. The present model includes an insulated region between axially aligned heat pipes and considers the effects of a two-dimensional model. The present model includes an insulated region between axially aligned heat pipes and considers the effects of charge diameter, charge motion, thickness and thermal conductivity of a confining crucible, thermal conductivity change at the crystal-melt interface and non-infinite charge length. Results are primarily given in analytical form and can be used without recourse to computer work for both improved furnace design and optimization of growth conditions in a given thermal configuration. (8 refs.)

68428 The formation of $CuInSe_2$ from the elements. G.Kuhn, U.Boehnke (Sektion Chem., Karl-Marx-Univ., Leipzig, Germany).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.415-16 (March 1983).
From powder X-ray diffraction analysis and DTA experiments it was found that in the temperature range from 220 to 320°C most of the heat of reaction is due to the interaction of liquid In and liquid or gaseous Se. The ternary compound $CuInSe_2$ always begins to form at temperatures below 300°C. (10 refs.)

68429 Dislocation-free GaAs and InP crystals by isoelectronic doping. G.Jacob, M.Duseaux, J.P.Farges, M.M.B.van den Boom, P.J.Roksnoer (Labs. d'Electronique et de Phys. Appl., Limeil-Brevannes, France).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.417-24 (March 1983).
The influence of isoelectronic doping on the properties of LEC GaAs and InP crystals has been studied. These crystals exhibit the usual electrical properties. A decrease of the dislocation density is obtained using In and Sb as dopants in GaAs crystals, and Sb. As and Ga As dopants in InP crystals. GaAs:In crystals in the range of 20-35 mm diameter and 100-300 g in weight have been obtained nearly dislocation free. (12 refs.)

68430 Three ways of growing undoped semi-insulating GaAs single crystals. M.Bonnet, N.Visentin, B.Lent, C.Raffet (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
Rev. Tech. Thomson-CSF (France), vol.15, no.1, p.39-57 (March 1983). In French.
Describes three different ways of obtaining large-diameter (50-80 mm) undoped semi-insulating GaAs single crystals intended for ion implantation in the manufacture of integrated circuits. Semi-insulating crystals may be obtained by growing from quartz crucibles and either adjusting the moisture content of the encapsulant, or adding gallium oxide to melt, or, alternatively, by growing from boron nitride crucibles. The electrical properties show that in all three cases it is possible to have a resistivity higher than 10^7 Ω cm, coupled with mobility better than 4000 $cm^2.V^{-1}.s^{-1}$. The authors show the effect which the moisture content of the encapsulation and the stoichiometry of the liquid have on the longitudinal homogeneity of the crystal's properties. In addition, chemical analyses make it possible to assert that there is only a small concentration of the main impurities ($<10^{16}$ at.cm^{-3}). (12 refs.)

68431 Microstructure and mechanisms for recrystallization in polycrystalline PbTe samples. Yu.D.Titarenko, E.P.Sabo, N.I.Grechko.
Inorg. Mater. (USA), vol.18, no.6, p.793-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.946-8 (June 1982). [received: Feb. 1983]
The quantitative characteristics of the microstructure of polycrystalline PbTe samples obtained by low-temperature pressing (at <450°C) are a factor of the particle size of the starting powder. Recrystallization in the samples during heat treatment proceeds by an in situ mechanism. The microstructure of samples pressed at ≥600°C is independent of the particle size of the starting powder and is determined by the pressing temperature and pressure. Recrystallization in these samples proceeds by a collective mechanism and subsequent heat treatment does not alter the quantitative characteristics of the microstructure. (5 refs.)

68432 Growth of $Cd_{1-x}M_xCr_2Se_4$ single crystals (M=In, Al, Ag, Cu) by chemical transport reaction method. A.I.Merkulov, S.I.Radautsan, V.E.Teelevan, R.Yu.Lyalikova (Inst. of Appl. Phys., Acad. of Sci., Moldavian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.816 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.973-5 (June 1982). [received: Feb. 1983]
Conditions have been determined for the growth of $CdCr_2Se_4$ single crystals doped with various impurities over a wide range of concentrations, these crystals being grown by the chemical transport reaction method. It has been shown that indium or aluminium accelerates the mass transport rate, and silver or copper retards the rate. (7 refs.)

68433 Growth and some properties of single crystals of $CuAlSe_2$ and $CuGaSe_2$. I.V.Bondar' (Inst. of Solid State Phys. & Semiconductors, Acad. of Sci., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.934-7 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1104-7 (July 1982). [received: Feb. 1983]
Single crystals of the ternary compounds $CuAlSe_2$ and $CuGaSe_2$ are grown by means of chemical transport reactions. The microstructure and microhardness of the crystals are investigated. The unit-cell parameters, melting points, and forbidden-band widths are determined at 77K and 300K in polarized light. (11 refs.)

68434 Synthesis and physical properties of $Ca(Cu_{1-x}Mn_x)_3Mn_4O_{12}$. I.O.Troyanchuk, A.A.Samokhvalov, T.I.Arbuzova, B.A.Gizhevskii, V.S.Babushkin, L.A.Bashkirov, A.K.Bogush, L.V.Balyko, V.B.Shipilo (Inst. of Solid State Phys. & Semiconductors, Acad. of Sci., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1025-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1217-21 (July 1982). [received: Feb. 1983]
In solid solutions $Ca(Cu_{1-x}Mn_x)_3Mn_4O_{12}$ with a perovskite-like structure, the parameter of the cubic unit cell varies linearly with the value of x from 7.210 Å at x=0 to 7.338 Å at x=0.82. When 20% of the copper is replaced by manganese (x=0.2), the Curie point remains practically unchanged, remaining at (350±5)K, but the saturation magnetization increases. With higher Mn^{3+} ion contents in the C sublattice, these parameters appreciably decrease. The compositions under investigation are semiconductors with high carrier concentration and low carrier mobility. (3 refs.)

81.15 METHODS OF THIN FILM DEPOSITION

(inc. epitaxial growth methods; see also 68.55 Thin film growth, structure, and epitaxy)

68435 Stick-on cobalt oxide selective coatings for solar thermal applications. C.Choudhury, D.S.Hrshikesan, H.K.Sehgal (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.821-3 (Oct. 1982). [received: April 1983]
Investigations carried out on spray deposited cobalt oxide selective coatings grown on aluminium foils and mounted on commercial galvanized iron sheets are found to have photo-thermal conversion efficiencies comparable with those of the films grown directly on commercial galvanized iron substrates. Optimum selective performance was obtained for films grown at ~190°C on aluminium foils. Optimized films were observed to be ~0.117 μm thick and have $\alpha=0.85$ and $\varepsilon_{100C}=0.125$. Accelerated life tests indicate that these films have good adhesion to the substrates and stable performance characteristics under dry and humid environments. (9 refs.)

68436 The growth of submicron eutectic thin film structures. H.E.Cline (General Electric Corporate Res. & Dev., Schenectady, NY, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.217-30
As the minimum dimension of electronic circuits is reduced below one micron, there has been increased interest in developing techniques for fabricating submicron structures. Pb-Sn, Cd-Pb and Al-Al_2Cu eutectic thin films were directionally solidified at rates between 0.0015 cm/sec and 0.15 cm/sec with both a lamp and a laser heat source to fabricate fault free submicron periodic structures. A transition from lamellar to cellular structures with increasing

solidification rate was observed with a thermal gradient of 200°C/cm applied with the lamp heat source. Cells did not form with the increased thermal gradient produced by the laser heat source, 8000°C/cm. Spacings as fine as 0.1 micron were observed in the Cd-Pb eutectic. A maximum theoretical growth rate was estimated which corresponds to a spacing of 80 A. (21 refs.)

68437 Highly oriented zinc oxide films. I.M.Grankin, G.I.Kal'naya, N.M.Prishchepa (Fiftieth Anniversary of the Great October Revolution Kiev Polytech. Inst., Kiev, Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.5, p.689-92 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.820-4 (May 1982). [received: Feb. 1983]
Conditions were found for the preparation of unstrained, stoichiometric, highly dispersed zinc oxide films with a close-to-normal orientation of the crystallite c-axes relative to the base using combined sputtering and heat treatment. (9 refs.)

68438 Low temperature deposition of silicon nitride by reactive ion-beam sputtering. D.Bouchier, G.Gautherin, C.Schwebel, A.Bosseboeuf (Inst. d'Electronique Fondamentale, Univ. Paris XI, Orsay, France), B.Agius, S.Rigo.
J. Electrochem. Soc. (USA), vol.130, no.3, p.638-44 (March 1983).
The deposition mechanism of reactive ion beam sputtered silicon nitride was studied. Using RBS analysis, the composition of Si_xN_y layers deposited at room temperature has been investigated as a function of different parameters. Irrespective of the nitrogen partial pressure, ranging from 10^{-4} to 0.2 Pa, the stoichiometry of the film depends only on the sputtering yield of silicon in the range 0.4-20 keV. Si_3N_4 layers can be obtained at low voltage, but only with a low deposition rate (typically 1 nm/min at the authors experimental conditions). In order to obtain Si_3N_4 films with higher deposition rates, the author increased the nitridation of deposited silicon, either by introducing in the deposition chamber of a highly reactive molecule such as NH_3, or by using electronic bombardment, which stimulates the adsorption of N_2 on the growing film. (28 refs.)

81.15G Vacuum deposition

68439 Effects of very low growth rates on GaAs grown by molecular beam epitaxy at low substrate temperatures. G.M.Metze, A.R.Calawa (Lincoln Lab., MIT, Lexington, MA, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.818-20 (1 May 1983).
Molecular beam epitaxy of GaAs is conventionally performed at growth rates of ~1 μm/h. For growth rates in this range, donor-doped films grown at substrate temperatures below 500°C have low carrier concentrations and high resistivities. The authors have grown Si-doped films with good electrical properties at substrate temperatures of 380 and 450°C by reducing the growth rates to ~0.02 and 0.2 μm/h, respectively. They believe that the improvement can be attributed to a reduction in the concentration of crystal defects, which occurs because the Ga and As atoms adsorbed on the substrate surface have sufficient time to reach appropriate lattice sites before they are incorporated into the growing film. (9 refs.)

68440 Electrical and photo-luminescence properties of ZnSe thin films grown by molecular beam epitaxy: substrate temperature effect. T.Yao, M.Ogura, S.Matsuoka, T.Morishita (Electrotech. Lab., Ibaraki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L144-6 (March 1983).
The substrate temperature effect on electrical and PL properties of undoped MBE ZnSe has been investigated. Resistivity (ρ) of the epilayers shows an abrupt change with the substrate temperature (T_s): $\rho \sim 10^6$ ohm-cm for $T_s \sim 250°C$ or $\gtrsim 400°C$, while $\rho \sim 1$ ohm-cm for $280°C \lesssim T_s \lesssim 370°C$. The substrate temperature dependence of PL spectra of the epilayers reveals that (1) the high resistivity is caused by the increase of the SA centers above 400°C and below 250°C, and (2) the diffusion of As and Ga from the GaAs substrate occurs during the growth process.

68441 Effect of various plasmas on vacuum deposited amorphous and microcrystal silicon. P.H.Fang, Zhong Huan, Yinqun Gao, C.C.Schubert, J.H.Kinnier (Dept. of Phys., Boston Coll., Chestnut Hill, MA, USA).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L147-8 (March 1983).
A gaseous plasma of oxygen, nitrogen, hydrogen and air has been used to treat amorphous and microcrystal silicon. The resultant effect, as measured by the photovoltaic characteristics of solar cells made of these materials, is that all of these gases can be effectively incorporated into the amorphous and microcrystal silicon to produce a beneficial photovoltaic effect. There is some difference in thermal stability; nitrogen is very similar to hydrogen and is higher in stability, and oxygen and air are somewhat lower. (10 refs.)

68442 GaAs vapour phase epitaxy on curved surfaces. B.P.Jain, K.Chand, I.Chandra, B.L.Sharma (Solid State Phys. Lab., Delhi, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.824-5 (Oct. 1982). [received: April 1983]
Vapour phase epitaxy of GaAs has been carried out on concave spherical and concave cylindrical GaAs substrates using $AsCl_3$-Ga-H_2 open-tube system. The experimental set-up used for preparing curved surfaces is briefly discussed. The growth parameters on the curved surface and the surface morphology of deposited layers have been investigated, using the techniques of optical and scanning electron microscopy. (2 refs.)

68443 Binary metal alloys obtained by vacuum evaporation and condensation. A.A.Babad-Zakhryapin, R.Kh.Zhalilov.
Inorg. Mater. (USA), vol.18, no.6, p.819-21 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.976-8 (June 1982). [received: Feb. 1983]
The Ni+Cr, W+Mo, $W+Al_2O_3$, and $Cr+Cr_2O_3$ binary metallic coats obtained by vacuum evaporation and condensation were studied. The coats were found to have a lamellar structure, including the W+Mo alloy at a deposition temperature of 1300K. Laminated coats are formed when two phases appear in the process of their growth. It was shown that the observed structures of the coats obtained by vacuum condensation of vapours and decomposition of vapours of volatile compounds are practically the same. (6 refs.)

68444 Effect of arsenic dimer/tetramer ratio on stability of III-V compound surfaces grown by molecular beam epitaxy. C.E.C.Wood, C.R.Stanley, G.W.Wicks, M.B.Esi (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).
J. Appl. Phys. (USA), vol.54, no.4, p.1868-71 (April 1983).
Using a post-effusion thermal cracking furnace, the 'arsenic stabilization' efficacy of As_2 versus As_4 on the surfaces of (100) GaAs, $Al_{0.48}In_{0.52}As$,s $Ga_{0.47}In_{0.53}As$ and $(AlGa)_{0.47}In_{0.53}As$ has been studied. Dimers were found to be no more efficient than tetramers either slightly below, at, or above the upper congruent sublimation temperature. (17 refs.)

68445 Extremely uniform GaAs-AlGaAs heterostructure layers with high optical quality by molecular beam epitaxy. T.Fujii, S.Hiyamizu, O.Wada, T.Sugahara, S.Yamakoshi, T.Sakurai, H.Hashimoto (Fujitsu Ltd., Kawasaki, Japan).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.393-6 (March 1983).
The authors describe experiments in which the light output of molecular beam epitaxy (MBE) grown GaAs-AlGaAs LED's varied less than 3.5%. Also the threshold current density (J_{th}) of a MBE-grown GaAs-AlGaAs double-heterostructure laser was only 870 A/cm^2. Such extremely uniform radiance and low J_{th} show the superiority of MBE over other epitaxial growth techniques which might be applicable to integrated optics. (9 refs.)

68446 Transparent conducting layers, their preparation and utilisation. F.Pribyl.
Slaboproudy Obz. (Czechoslovakia), vol.44, no.3, p.140-2 (March 1983). In Czech.
Three main technologies of depositing transparent conducting layers based on Sn, In and Cd oxides or their combinations are dealt with: pyrolytic deposition of chlorides, cathode sputtering and vacuum evaporation. Methods of etching are also discussed including the plasma etching technology. Electrical and optical properties of the fabricated layers are briefly dealt with and their adhesive capacity is discussed. (3 refs.) *E.D.*

81.15H Chemical vapour deposition

68447 Laser induced deposition of zinc oxide. R.Solanki, G.J.Collins (Engng. Res. Center, Colorado State Univ., Fort Collins, CO, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.662-3 (15 April 1983).
The authors have used an excimer laser to photodeposit uniform (±5%) films of zinc oxide from dimethylzinc and nitrogen dioxide. Deposition rates of 3000 Å/min over 2 cm×5 areas were obtained. They have measured the stress, refractive index, etch rate, adhesion, pinhole density, and the stoichiometry of these photodeposited films. (18 refs.)

68448 Optical and electrical properties of amorphous silicon films prepared by photochemical vapor deposition. T.Saitoh, S.Muramatsu, T.Shimada, M.Migitaka (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).
Appl. Phys. Lett. (USA), vol.42, no.8, p.678-9 (15 April 1983).
Amorphous silicon films have been prepared through mercury-photosensitized decomposition of monosilane gas at low temperatures. The films show optical and electrical properties comparable with those of the best films prepared by plasma chemical vapor deposition. The feasibility of amorphous solar cells with short-circuit current densities of more than 10 mA/cm^2 has been demonstrated by fabrication of a Schottky barrier structure. (6 refs.)

68449 Crystallization of amorphous silicon films during low pressure chemical vapor deposition. E.Kinsbron, M.Sternheim, R.Knoell (Bell Labs., Murray Hill, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.835-7 (1 May 1983).
The crystallization of low pressure chemical vapor deposition amorphous silicon films was studied by transmission electron microscope observations. The results demonstrate the interdependence of the silicon deposition rate, the incubation time for nucleation, and the crystalline growth rate. At temperatures below 600°C the deposited films are amorphous, but partial crystallization can occur if the deposition time is longer than the incubation time. Crystallization occurs through an epitaxial-like growth from nucleates near or at the substrate interface; the crystalline phase will reach the depositing interface for thick films if the growth rate exceeds the deposition rate. The crystallized fraction of the deposited layer can be controlled by regulating the deposition temperature and rate and by in situ addition of dopant impurities. At temperature higher than 600°C the deposited films are polycrystalline and columnar in structure. The surface texture is much smoother for films whose surfaces are amorphous. (23 refs.)

68450 On batch homogeneity in horizontal CVD reactors. I. Model of heating the process gas. F.Richter (Inst. fur Phys. der Werkstoffbearbeitung, Akad. der Wissenschaften, Berlin, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.551-62 (1983).
A model of heating of the process gas during its flow along the heater is given as an attempt to describe the batch homogeneity with layer deposition and gas phase etching processes in horizontal CVD-reactors. An analytical expression is derived for the resulting longitudinal temperature profile $T(x)$ dependence of the gas properties, susceptor temperature, geometric parameters of the reactor, and gas flow rate. (7 refs.)

68451 Laser induced chemical vapor deposition of Ni by decomposition of $Ni(CO)_4$. W.Krauter, D.Bauerle, F.Fimberger (Angewandte Phys., Johannes-Kepler-Univ., Linz, Austria).
Appl. Phys. A (Germany), vol.A31, no.1, p.13-18 (May 1983).
Polycrystalline Ni has been grown by decomposition of $Ni(CO)_4$ using different wavelengths of the visible radiation of a Kr^+ laser. The influence of laser

irradiance, substrate material and scanning velocity on deposition rate and widths of patterns has been investigated. The deposition rates achieved are typically several μm/s, and the lateral dimensions of the deposits can be as small as 1 μm. (9 refs.)

68452 Possibilities and limitations for the application of CVD-coated cemented carbide tools and steel tools. W.Schintlmeister, J.Kanz, W.Wallgram (Metallwerk Plansee GmbH, Reutte, Austria).
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.41-3 (March 1983).
Important wear characteristics of hard coatings and the influence of the coating on the toughness of the tools are described. From this, the application possibilities and limitations for CVD coated tools are deduced. In addition to the applications for coated hardmetal tooling for tuning, special coatings for milling and for chipless forming are described. With regard to coated steel tooling the most important application examples as well as the limitations, particularly with respect to heat treatment, are referred to. Finally, a brief description of an economic and efficient production coating unit is outlined. (7 refs.)

68453 Growth of epitaxial CdTe films in the $Cd(CH_3)_2$-$(CH_3)_2Te$-H_2 system. P.I.Kuznetsov, L.A.Zhuravlev, I.N.Odin, V.V.Shemet, A.V.Novoselova (Inst. of Radioengng. & Electronics, Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.779-83 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.930-4 (June 1982). [received: Feb. 1983]
Epitaxial CdTe layers on CdS(0001)S and muscovite mica supports were obtained by gas-phase chemical deposition in the $Cd(CH_3)_2$-$(CH_3)_2Te$-H_2 system. Electron-diffraction analysis and microscopic investigations of the film surface morphology and crystal structure were performed. The dependence of CdTe film growth rates on the support temperature, component concentration in the vapor-gas mixture, and hydrogen consumption was determined. The optimal regime for the growth of monocrystalline CdTe films was established. It was found that CdTe films are highly resistive and their absorption spectra contain exciton lines. (8 refs.)

68454 Deposition and properties of zinc phosphide films. T.L.Chu, S.Chu, K.Murthy, E.D.Stokes (Southern Methodist Univ., Dallas, TX, USA), P.E.Russell.
J. Appl. Phys. (USA), vol.54, no.4, p.2063-8 (April 1983).
Thin films of zinc phosphide have been deposited on tungsten-coated steel substrates at 400-600°C by the reaction of zinc and phosphine in a hydrogen atmosphere; tungsten was used as a barrier against the diffusion of iron from the substrate into zinc phosphide. By using a proper PH_3/Zn molar ratio, the deposited films have been identified by electron microprobe and X-ray diffraction techniques to be Zn_3P_2. The electrical resistivity and photovoltage of unintentionally doped zinc phosphide films were measured as a function of the composition of the reaction mixture. The effective intragrain minority carrier diffusion length in nearly stoichiometric films was measured by the scanned beam method using a Schottky barrier structure. The incorporation of dopants into zinc phosphide films was also explored. (10 refs.)

68455 The growth of Zn_3P_2 by metalorganic chemical vapor deposition. J.Long (Bell Labs., Murray Hill, NJ, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.725-8 (March 1983).
The growth of undoped, polycrystalline Zn_3P_2 by the method of metalorganic chemical vapor deposition has been demonstrated and the growth characteristics determined as a function of growth conditions. The quality of the layers was observed to be highly dependent on the substrate material. The samples growth on graphite exhibited microcracks due to a mismatch of the thermal expansion coefficient of Zn_3P_2 with that of the graphite. This problem was eliminated by use of mica or silicon steel as the substrate. (4 refs.)

68456 Alloying mechanisms in MOVPE $GaAs_{1-x}$. L.Samuelson, P.Omling, H.G.Grimmeiss (Dept. of Solid State Phys., Univ. of Lund, Lund, Sweden).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.425-6 (March 1983).
Novel experimental and analysis approaches are presented for the extraction of crucial data for vapour phase and surface chemistry mechanisms governing the solid phase composition of alloys. Applied to MOVPE of $GaAs_{1-x}P_x$, an activation energy of $E_A \approx 1$ eV (23 kcal/mole) for the As/P competition on the group V sub-lattice is deduced. (4 refs.)

68457 Low-pressure metalorganic chemical vapor deposition of InP, GaInAs and GaInAsP. M.Razeghi (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
Rev. Tech. Thomson-CSF (France), vol.15, no.1, p.59-86 (March 1983). In French.
Low pressure MOCVD epitaxial growth is used for the growth of: 1. the entire composition range of $Ga_xIn_{1-x}As_yP_{1-y}$ ($0.47 \leq x \leq 0$ and $0 \leq y \leq 1$) uniform composition lattice matched to InP over an area of 10 cm^2; 2. nonintentionally doped InP with $N_D - N_A = 6 \times 10^{14}$ cm^{-3}, $\mu(300) = 5300$ cm^2.V^{-1}.s^{-1}, $\mu(77) = 58000$ cm^2.V^{-1}.s^{-1}; 3. nonintentionally doped $Ga_{0.47}In_{0.53}As$ with $N_D - N_A = 2 \times 10^{15}$ cm^{-3}: $\mu(300) = 12000$ cm^2.V^{-1}.s^{-1}, $\mu(77) = 60000$ cm^2.V^{-1}.s^{-1} and $\mu(2) = 90000$ cm^2.V^{-1}.s^{-1}; 4. the first reported growth of $GaAs_{0.47}In_{0.53}As$/InP superlattice. The compositional grading at both interfaces of InP/GaInAs/InP extending over a region less than 60 Å thick; 5. the first observation of a two dimensional gas of high mobility electrons at the interface of a GaInAs/InP heterojunction; 6. the formation of good quality GaInAsP/InP double heterostructures for laser applications. (16 refs.)

68458 General computer simulation formulae of low pressure chemical vapor deposition. Wang Jitao (Dept. of Phys., Fudan Univ., Shanghai, China).
Sci. Sin. (China), vol.26, no.3, p.273-83 (March 1983).
Recently, the technique of low pressure chemical vapor deposition (LPCVD) has been used extensively in semiconductor industry because of its extremely favorable economics. Its theoretical work, however, has rarely been reported. After deriving computer simulation formulae of LPCVD poly-Si films, a set of general computer simulation formulae are derived, which are used successfully in the computer simulation for LPCVD SiO_2 and Si_3N_4. This shows the theoretical simulation method is generally conformable to the technology of LPCVD. Some new rules have been obtained theoretically. They are in favor of improving the technique of LPCVD and of optimizing the design of LPCVD equipments. (7 refs.)

68459 Nitrogen activation for plasma chemical synthesis of thin Si_3N_4 films. L.Bardos, J.Musil, P.Taras (Inst. of Plasma Phys., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Thin Solid Films (Switzerland), vol.102, no.2, p.107-10 (15 April 1983).
The authors summarize a study of the reactions of plasma-activated nitrogen with silane and NO admixture during the plasma-enhanced chemical vapour deposition (PECVD) of Si_3N_4 films outside the plasma region. The dominant role of nitrogen atoms, mainly in the ground (^4S) state, was demonstrated experimentally. Probable chemical processes in the PECVD zone are discussed. (8 refs.)

68460 Theoretical influence of the chemical vapour deposition processes on the thickness and structural uniformity of the deposits. L.Vandenbulcke (Centre de Recherches sur la Chimie de la Combustion et des Hautes Temperatures, Orleans, France).
Thin Solid Films (Switzerland), vol.102, no.2, p.149-60 (15 April 1983).
A mass transfer-surface kinetics model allows a study to be made of the relative importance of gas phase diffusion and surface kinetics. It provides a method of predicting the uniformity and morphology of deposits as functions of the supersaturation at the gas-solid interface. A simple geometry is used in which the direction of the gas flow is parallel to a flat deposition surface but the results can be extended to other geometries and large-scale reactors as the dual influence of the depletion of reactants and the variation in the boundary layer thickness along the surface occurs. Uniformity of the thickness and the structure is predicted when the supersaturation is high, at low pressure, low temperature and high gas flow rate. At low supersaturation and in intermediate conditions it appears that careful attention to the gas flow pattern is necessary to obtain uniform deposits. Calculations are carried out for the B-H-Cl system but the results can be extended to the deposition of various materials. (31 refs.)

81.15J Ion plating and other vapour deposition

68461 Growth of hydrogenated amorphous silicon due to controlled ion bombardment from a pure silane plasma. B.Dervillon, J.Perrin, J.M.Siefert, J.Huc, A.Looret, G.de Rosny, J.P.M.Schmitt (LPNHE, Ecole Polytech., Palaiseau, France).
Appl. Phys. Lett. (USA), vol.42, no.9, p.801-3 (1 May 1983).
The growth process, optical and structural properties of *a*-Si:H films deposited from a silane multipole DC discharge are analyzed by a real time and spectroscopic ellipsometry, and IR absorption spectroscopy. Films deposited mainly from neutral polymerized species are systematically compared to films deposited from monomeric ionic species at various ion incident energy up to 100 eV. An increase of ion bombardment energy is shown to favor the formation of high density homogeneous and isotropic films. (14 refs.)

68462 Optimum geometry of high-voltage electrodes in conditions of vapour condensation. M.K.Bologa, I.K.Savin, A.B.Didkovskii.
Elektron. Obrab. Mater. (USSR), no.1, p.58-61 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
The results are given of investigations aimed at determining the optimum design of high-voltage electrodes and the inter-electrode distance in conditions of condensation of clean vapour and in the presence of a non-condensing gas. Because of the difference in the decisive thermal resistances in these heat-exchange processes, the choise of electrode geometry also appeared to be substantially diverse. In conditions of condensation of clean vapour the use of solid electrodes perforated with vertical slots is recommended, whilst corona-discharging wire electrodes are recommended for use in condensing vapour of steam-gas mixtures. 81.15L Deposition from liquid phases (melts and solutions)

68463 Liquid phase epitaxy of $Ga_xIn_{1-x}As_yP_{1-y}$. J.Ricciardi, B.de Cremoux (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
Rev. Tech. Thomson-CSF (France), vol.15, no.1, p.87-137 (March 1983). In French.
Having recalled the underlying principle of epitaxial growth in the liquid phase, the authors review the different models for calculating the phase diagram of the quaternary material $Ga_xIn_{1-x}A_yP_{1-y}$ used for optical communciations for wavelengths of 1.2 to 1.6 μ. The dynamic growth model already established for III-V binary materials is extended to quaternary materials. The experimental results that are indicated make it possible to refine the theoretical phase diagram and to verify the laws which the growth regime obeys. (31 refs.)

81.20 OTHER METHODS OF PREPARATION OF MATERIALS

68464 Carbon fibers produced by pyrolysis of natural gas in stainless steel tubes. G.G.Tibbetts (Phys. Dept., General Motors Res. Labs., Warren, MI, USA).
Appl. Phys. Lett. (USA), vol.42, no.8, p.666-8 (15 April 1983).
Carbon fibers of uniform diameter have been grown by pyrolysis of natural gas in type 304 stainless steel (18% Cr, 8% Ni) tubes at temperatures between 950 and 1075°C. The method utilizes the circulation of wet hydrogen outside the growth tube in order to promote effective nucleation. Fibers 12 cm long having average moduli 1.8×10^{11} Pa have been grown. (9 refs.)

68465 Synthesis and properties of $La_{1-x}K_xVO_3$ solid solutions with the perovskite structure. G.V.Bazuev, O.V.Makarova, G.P.Shveikin (Inst. of Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.5, p.720-4 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.859-63 (May 1982). [received: Feb. 1983]
New solid solutions with the perovskite structure $La_{1-x}K_xVO_3$, where $0\leq x\leq0.32$, were synthesized. When $x\leq0.10$, the solid solutions have a structure similar to the $LaVO_3$ structure (of the $GdFeO_3$ type, space group Pbnm, z=4, $a\approx b\approx c/\sqrt{2}$), whereas they have a rhombohedrally distorted perovskite structure (space group $R\bar{3}c$) when $x>0.10$. The electrical and magnetic properties were studied. A concentration transition from semiconductor to metallic conductivity when $x\approx0.12$ was established. (14 refs.)

68466 Preparation and electrical properties of $La_{2-x}Sr_xNiO_4$ (x=0-1.0). I.F.Kononyuk, N.G.Surmach, L.V.Makhnach (Sci.-Res. Inst. of Physicochem. Problems, V.I. Lenin Belorussian State Univ., Belorussian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.1029-31 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1222-5 (July 1982). [received: Feb. 1983]
The electrical properties of the solid solutions $La_{2-x}Sr_xNiO_4$ with x=0, 0.25, 0.50, 0.75, and 1.0 have been studied between room temperature and 700°C. It is found that as x increases from zero to 0.5, the room-temperature resistance increases from 3×10^{-4} to 8×10^{-4} Ω.m, after which it decreases to $(4\pm1)\times10^{-5}$ Ω.m at x=1.0. The conductivity of the solid solutions with $x<1$ is semiconducting between room temperature and 300-400°C and metallic at higher temperatures. The compound $LaSrNiO_4$ has n-type metallic conductivity. The temperature coefficient of the resistivity is $(15\pm2)\times10^{-4}$ deg^{-1}. (8 refs.)

81.20E Powder techniques, compaction and sintering

68467 Sintering ultra-dispersed metallic powders. V.V.Skorokiod (Inst. for Materials Sci. Problems,. Acad. of Sci., Kiev, Ukrainian SSR).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.395-9
Deals with the features of sintering ultra-dispersed metallic powders, taking into account the processes of locally-inhomogeneous densification and generation of dislocations in curing quasi-two-dimensional defects. Approximated evaluations are given for maximum possible sintering rates in accordance with the new mechanism. A qualitative correlation is demonstrated between theoretical and experimental data in the case of sintering ultra-dispersed tungsten powders. (9 refs.)

68468 Computer simulation of geometry change during liquid phase sintering. Z.S.Nikolic, M.M.Ristic (Faculty of Electronic Engng., Univ. of Nish, Beograd, Yugoslavia).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.477-81
The phenomenon of shrinkage during the liquid phase sintering is usually explained by the models developed on the base of the analogy with the experimental results. For the explanation of the shrinkage geometry the simulation method could be used. The simulation of the liquid phase sintering is used to observe the changes of the geometry model system, three spheres-plate and model system four spheres. By the choice of non-typical geometry of model-systems the authors observed the processes in the contact area and around spheres which do not form the neck area. (13 refs.)

68469 Some aspects of powder and composite materials deformation theory as a basis for improving compacting and sintering processes. S.S.Kiparisov, V.E.Perelman (Lomonosov Inst. of Fine Chem. Technol., Moscow, USSR).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.561-72
An analysis of general laws is given determining the porous articles deformation during compacting and sintering, and a description of the major factors which characterize the body deformation effect on these processes. An attempt is made to formulate the main trends of the research according to the role, place, and type of deformation effect on the sintering process. (10 refs.)

81.20G Specific metals and alloys (compacts, pseudoalloys)

68470 Morphology of powdered products at various stages of tungsten production. K.S.Chernyavskii, L.A.Usova, V.A.Fal'kovskii, K.Ya.Shapiro (All-Union Sci.-Res. & Planning Inst. of Refractory Metals & Hard Alloys, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.977-83 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1158-65 (July 1982). [received: Feb. 1983]
The literature data are analysed on the morphology of the powdered products in various stages of the technology of tungsten production. In investigating the reduction process, APT $(H_2WO_4)\rightarrow WO_3\rightarrow WO_x\rightarrow W$, a number of laws of the morphological conversions are established. (18 refs.)

68471 Production of high strength aluminium alloys by extrusion of atomized powders. T.Sheppard, M.A.Zaidi, G.H.Tan (Dept. of Metall. & Materials Sci., Imperial Coll. of Sci. & Technol., London, England).
Powder Metall. (GB), vol.26, no.1, p.10-16 (1983).
The mechanism of powder consolidation in the extrusion chamber is analysed and it is shown that theoretically the specific pressures required to extrude initial powder compacts will be lower than an equivalent cast billet. The hot working range of metals is thus enlarged and inherently stiffer materials may be extruded. The extrusion of Al alloys from air atomized powders is described and the conditions required for meaningful increases in properties elaborated. The production of Al alloys reinforced by glass is also described and it is shown that although strength levels may be enhanced this type of reinforcement does not lead to a product having a combination of properties significantly more attractive than the cast and wrought product. Consideration is given to other forms of reinforcement. The extrusion of rapidly solidified Al-10Mg powder shows that this non-heat treatable alloy has properties comparable with the strongest heat treatable Al alloy. (6 refs.)

68472 Liquid phase sintering of nickel base superalloys. M.Jeandin, J.L.Koutny, Y.Bienvenu (Centre des Materiaux, Ecole Superieure des Mines de Paris, Paris, France).
Powder Metall. (GB), vol.26, no.1, p.17-22 (1983).
Sintering in the presence of a liquid phase has been applied to several nickel base superalloy powders. The optimal sintering conditions have been inferred from a systematic study of densification parameters (temperature, sintering time, particle size distribution, etc.). Under these conditions, closed porosity sintered materials whose shape conforms closely to that of the container (ceramic mould) can be obtained. The mechanical properties of the sintered preforms are rather low because of residual porosity. A subsequent densification by hot isostatic pressing or forging is therefore necessary to attain high performances. However, this complete densification stage can be carried out without a sealed container, as long as the porosity is closed. Liquid phase sintered structures do not exhibit deleterious effects from the partial melting; these are revealed only by the titanium, molybdenum, and aluminium microsegregations. (15 refs.)

68473 The effects of pressing process on sintering process and final compact properties. D.C.Stefanovic, M.M.Ristic (Electronic Faculty, Univ. of Nis, Nis, Yugoslavia).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.431-7
Investigates the change of density, microstructure and electric feature of iron powder in pressing and sintering process. Presents results of experimental

observations in large interval of the pressure change during pressing and that way the Fe electronic structure was influenced. The experimental results enable the authors to make some conclusions about changes of electronic structure during consolidation processes. Thus it may represent a basis for a more general electronic theory for materials activation during consolidation of transition metals and other metal powders. Problem of consolidation of dispersed powders, when exposed to outer forces, has been examined from the point of view of the electron theory of solids. Particular attention was paid to the questions of electron transfer in the systems analysed making use of a model formulated by Pavle Savic. (12 refs.)

68474 Changes in dislocation and electronic structure during copper consolidation. M.I.Milosevski, D.Stefanovic, M.M.Ristic (Inst. of Tech. Sci., Serbian Acad. of Sci. & Arts, Beograd, Yugoslavia).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.453-9
Presents information on the consolidation of copper powder. The relationship between dislocation density, fractional density electronic structure and compaction pressure is established. (9 refs.)

68475 The effect of thermal treatment on microstructure of nickel base PM superalloys. M.Mitkov, M.Gligic (Boris Kidric Inst. of Materials Sci., Beograd, Yugoslavia), Dj.Nikovic.
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.527-32
APK-1, APK-4 and APK-7 superalloy powders were characterized by scanning electron microscopy as well as X-ray analysis, and than submitted to the identical powder metallurgy route of compact production (hot pressing and subsequent heat treatment). Special attention was paid to the microstructure development (precipitation of γ' phase and carbides distribution), during the different stages of sample treatment. (4 refs.)

68476 The effect of rhenium on the properties and structure of sintered tungsten-rhenium materials. S.Stolarz, K.Wojtasik, M.Wojtasik (Inst. of Nonferrous Metals, Gliwice, Poland).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.551-7
The results of investigations on sintering of half-products of tungsten-rhenium alloys with rhenium contents of from 5 to 15 wt.%, produced by P/M technique are presented. In sintering conditions examined it was found that the sintering process runs more readily for alloys with lower rhenium content (up to 10 wt.%). (no refs.)

68477 Growth and thermal stability of γ/γ'-α eutectic composite. Y.G.Nakagawa (Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo, Japan), M.Nemoto.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.143-53
Summarizes the results of a series of investigations carried out for a γ/γ'-α(Ni-Al-Mo) eutectic. The subjects include a thermal analysis of the composite growth in a high temperature gradient provided by a fluidized bed cooling, a study of defect formation such as the banding structure at unstable thermal conditions, TEM observation and phase identification for microphases in an as-growth state as well as phases produced after various quench and aging treatments, and an evaluation of the composite thermal stability in terms of the microstructures and the high temperature strength. The fluidized bed placed beneath a melting furnace was proved to establish a temperature gradient equivalent to the liquid metal cooling, and to promote a stable steady growth of the composites without bandings. Quenching the eutectic above a peritectoid temperature diminished the blocky γ'. The subsequent aging treatments induced small Mo platelets above 830°C and below the temperature a metastable Ni_2Mo particle precipitation in the γ phase causing appreciable composite hardening. (6 refs.)

68478 Development of the γ-γ'-Cr_3C_2 in-situ composite. M.McLean, P.N.Quested, P.J.Henderson, K.Menzies (Div. of Materials Applications, NPL, Teddington, England).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.167-80
The effects of various alloy additions to the microstructures and properties of the γ-γ'-Cr_3C_2 in-situ composite have been investigated. Combinations of platinum and yttrium prevent the formation of an additional phase that occurs when yttrium alone is added; the phase morphology is unaffected by rhenium and ruthenium dopants. Combined quenching studies and differential thermal analysis show that phase alignment at high growth rates in this alloy is not due to plane front solidification but to highly branched carbide growth ahead of the melt/matrix interface. This mechanism allows good phase alignment to be achieved over a wide composition range. Tests on six alloy casts to commercial specifications indicate retention of, and often improvement to, the microstructures and properties obtained with laboratory control. (7 refs.)

68479 In situ composites prepared by solidification and mechanical techniques. J.D.Verhoeven (Dept. of Materials Sci. & Engng., Iowa State Univ., Ames, IA, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.267-76
An alternate in situ technique is presented for preparation of aligned microstructures which has been successfully applied to the preparation of copper alloys. In this technique, a two-phase alloy is first prepared by conventional casting techniques to produce a random array of dendrites of phase 1 in a matrix of phase 2. The casting is then reduced to wire size by mechanical reductions. It is demonstrated that the alignment of the dendritic phase produced by the mechanical reduction is surprisingly good, and that one can achieve a wide range of microstructural control over the filament size and morphology by utilization of controlled coarsening anneals followed by additional wire drawing. Examples are presented of Cu-Nb alloys which are converted to Nb_3Sn-Cu superconducting wires possessing excellent critical current values, and of Fe-Cu alloys which produce wires having quite high strength to resistivity ratios. (13 refs.)

68480 Mechanical and superconducting properties of Cu-Nb_3Sn in situ produced composite wires. A.Kolb-Telieps (Inst. fur Werkstoffkunde und Werkstofftechnik, Tech. Univ. Clausthal, Clausthal, Germany), B.L.Mordike, M.Mrowiec.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.277-81
Cu-Nb composite wires were produced from powder, electrolytically coated with tin and annealed to convert the Nb fibres to Nb_3Sn. The content was varied between 10 wt.% and 40 wt.%. The superconducting properties of the wires were determined. The mechanical properties, tensile strength, yield strength and ductility were measured as a function of volume fraction and deformation over a wide temperature range. The results are compared with those for wires produced by different techniques. (10 refs.)

81.20J Dispersion-,fibre-, and platelet-reinforced metal-based composites

68481 On formation of the structure of sintered dispersion strengthened materials. I.M.Fedorchenko, I.I.Ivanova, A.N.Demidik, G.F.Sarjhan (Inst. of Material Sci., Acad. of Sci., Kiev, Ukrainian SSR).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.379-85
Along with the factors determining the properties of any heat resistant materials, the properties of dispersion strengthened materials are affected by the very existence of disperse inclusions of nondeforming second phase. Investigation of mechanical properties and structural peculiarities of iron, strengthened by titanium oxide, as well as magnesium and yttrium oxides was carried out. It was shown that the influence of disperse refractory phase on the properties of materials depends on the temperature area of the test. There are four, rather definitely distinguished temperature intervals, where this influence is essentially different. The effect of strengthening depends on the nature of the destruction of matrix and ratio of matrix strength and strengthening phase. (2 refs.)

81.20L Ceramics and refractories

68482 A study on the fabrication and the lanthanum dependence characteristics of (Pb, La) (Zr, Ti) O_3 ceramics. Chang-Yub Park, Young-Hee Lee, Ki-Hong Kwon.
Trans. Korean Inst. Electr. Eng., vol.32, no.1, p.1-6 (1983). In Korean.
Investigates fabrication of the (Pb, La) (Zr, Ti) O_3 ceramics by normal sintering method and investigates the effects on the ferroelectric characteristics and on the light transmission(%) according to La contents. The results of the investigation were as follows: the optimum soaking conditions were 1300°C, 9 hours, and it turned out that PLZT 6/65/35 has the largest electromechanical coupling factor; in addition, $k_p=0$ was found in the case of PLZT 12/65/35 and PLZT 15/65/35; the Curie temperature was decreased linearly to the La content, and the largest value of relative dielectric constant was 3836 for PLZT 9/65/35 at room temperature; the maximum value of light transmission(%) was about 23% for PLZT 9/65/35 and it was found that the fundamental absorption edge decreased linearly according to the soaking time. (10 refs.)

68483 Formation of silicon nitride fibers by nitriding silicon in a current of ammonia. T.S.Bartnitskaya, P.P.Pikuza, I.I.Timofeeva, T.Ya.Kosolapova (Inst. of Problems in Materials Sci., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.7, p.972-4 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1151-3 (July 1982). [received: Feb. 1983]
Chemical, X-ray, and crystal-optical analysis are used to investigate the process of formation of silicon nitride fibers during the nitriding of silicon with ammonia. It is shown that the yield and morphology of the fibers are determined by the reaction temperature and time and the purity of the original silicon. The fibers which are formed consist of both modifications of silicon nitride. (3 refs.)

68484 Preparation of a Ni-Zn ferrite from a submicronic grain size powder. P.A.Morell (Lab. Central de Recherches, Thomson-CSF, Orsay, France).
Rev. Tech. Thomson-CSF (France), vol.15, no.1, p.237-52 (March 1983). In French.
In order to improve the chemical homogeneity and the particle size distribution of the Ni-Zn ferrite, a study was made of the preparation of this material by the coprecipitation technology. The conditions of the synthesis are described and the material is then analyzed (chemical composition, particle size distribution, specific surface area, X-ray, microscopy, etc.) Sintering is studied on cylindrical samples, isostatically pressed at 1.6 t/cm^2. Densification is obtained either by classical sintering or by hot-pressing. In all cases porosity is less than 1%. The magnetic permeability measured at 10 KHz varies from 1800 to 3300 depending on the sintering mode involved. The microstructures are regular, the grain sizes of hot-pressed and classically sintered materials are 2 and 6 μm respectively. The sintering temperature is lower compared to that required for samples prepared from the mixed oxides technique. (8 refs.)

68485 Sintering behaviour of an yttria stabilized zirconia. L.del Olmo, P.Duran, C.Moure (Inst. de Ceramica y Vidrio, Madrid, Spain).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.401-8
Simultaneous coprecipitation of yttrium and zirconium hydroxides from water solution of chlorides was used to obtain yttria-stabilized zirconia powders. The

adequate pre-calcination of the coprecipitates produced an extremely active powder which sintered to 95% theoretical density at very low temperature ($<1300°C$). It was found that the aggregates sizes strongly influenced the final density attainable on sintered bodies. Initial-stage sintering kinetics is governed by a proportionality t^n in which n varied between 0.10 and 0.25 in the temperature range studied. As a consequence both surface diffusion and grain-boundary diffusion are probably the two mechanisms present during the initial stages of sintering. (8 refs.)

68486 The sintering behaviour of an active premullite powder obtained from kandites. J.S.Moya, F.J.Valle, S.de Aza (Inst. de Ceramica y Vidrio, Madrid, Spain).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.409-15
An active powder denominated 'premullite' has been obtained by thermal and chemical treatment from a natural halloisite on the basis of a new interpretation of the kaolinite-reaction-series. The powder has been characterized by XRD, SEM and BET. The sintering behaviour has been studied and the results favorably compared with two other powders obtained by a mixture of calcined halloisite $+Al_2O_3$ and by a gel-process. (14 refs.)

68487 Synthesis and sintering of zirconia fine powders by hydrothermal reactions from zirconium metal and high-temperature high-pressure solutions. M.Yoshimura, S.Somiya (Lab. for Hydrothermal Syntheses, Tokyo Inst. of Technol., Yokohama, Japan).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.417-22
A new method, hydrothermal oxidation method, has been developed to prepare zirconia fine powders by reactions between Zr metal and high-temperature high-pressure water or solutions. Zr metal and water sealed in a Pt capsule reacted under 98 MPa above 250°C and produced monoclinic ZrO_2 fine grains having the average crystallite size of 24 nm. Further heating of this product up to 1000°C yielded a dense sintered body of m-ZrO_2 with the maximum relative density of 99.0%. The hydrothermal oxidation method has been applied to the preparation of stabilized zirconia powders using Ca or Y solutions instead of water. A partial stabilization has been achieved when an excess Zr in the capsule was found to decompose the solutes and the solvents at higher temperatures. (9 refs.)

68488 Influence of powder characteristics on the sintering of lead zirconate titanate powders. Ramji Lal, P.Ramakrishnan (Dept. of Metall. Engng., Indian Inst. of Technol., Bombay, India).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.423-9
The initial powder characteristics of lead zirconate titanate (PZT) have a profound infuence on the sintering, structure formation and properties of the finished piezoelectric ceramics. In the present investigation lead zirconate titanate powders of different characteristics were prepared by conventional ball milling, chemical coprecipitation and spray drying. The particle size, shape, surface area and X-ray diffraction pattern of the powders have been determined. The powders were then compacted, sintered at different temperatures and sintered structure and piezoelectric properties were evaluated. These results have been reported and discussed. (11 refs.)

68489 Grain and pore growth during the sintering of MgO at different water vapor partial pressures. J.A.Varela, O.J.Whittemore (Univ. of Washington, Seattle, WA, USA).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.439-45
Presents results of a study on the effect of the partial pressure of water vapor on the rate of sintering by measuring and correlating several parameters: pore size distribution, crystal size, surface area, and bulk density. (13 refs.)

68490 The investigation of sintering process and the strength of skeleton ceramics. Yu.L.Krasulin, A.B.Ivanov, V.N.Timofeev (Baikov Inst. of Metall., Acad. of Sci., Baikov, USSR).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.447-51
Presents information relating to the field of sintering and the strength of sintered materials. Approaches are discussed about the investigation of kinetics of neck formation between particles during the process of sintering in terms of the results of strength measurements. Experimental and calculated data are presented of the investigation of this process for the example of ceramics sintered from spherical particles of stabilized zirconia. (7 refs.)

68491 Sintering of partially stabilized zirconia. B.Pavlovski, L.Ilievska (Faculty of Technol., Univ. of Skopje, Skopje, Yugoslavia).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.471-6
Using the two techniques of preparation partialy stabilized zirconia, with 6 mol.% CaO, MgO, i.e. a mixture of CaO and MgO, was obtained. The sintering of the samples was carried out at 1673, 1773 and 1873K. It can be concluded that the samples of partially stabilized zirconia, with 6 mol.% MgO, during the testing of the resistance to thermoshocks results in destabilization of the cubic ZrO_2 that also leads to rapid cracking of the samples. The zirconia-calcia solid solution, in the partially stabilized zirconia with 6 mol.% CaO, reverted partially to the monoclinic form and the samples are more resistant to thermal shocks. The best thermal shock resistance was obtained with the partially stabilized zirconia with 3 mol.% CaO and 3 mol.% MgO. The sintered samples practically do not change their phase composition during the testing of the resistance to thermoshocks. (10 refs.)

68492 Sintering of calciumphosphate ceramics for biomedical purposes. K.De Groot (Dept. of Biomaterials, Free Univ., Amsterdam, Netherlands).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.483-6
Results are summarized of studies to prepare sintered calciumphosphate ceramics from commercially available powders. These ceramics, crystallographically either apatite or β-whitlockite, have good biological properties, but are rather poor mechanically, especially with respect to fatigue behavior. Clinical applications as bone replacement material are hence limited to areas where no mechanical loading occurs, or only compression takes place. (9 refs.)

68493 Ultra-rapid sintering of ceramics. D.L.Johnson, Joung Soo Kim (Northwestern Univ., Evanston, IL, USA).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.573-8
Alpha alumina tubes have been sintered in gas plasmas generated in a 5 MHz induction coil. Very high sintering rates were observed. For instance, thin wall tubes of 0.3 μm α-Al_2O_3 with 0.25% MgO which were passed through the induction-coupled plasma at 4 cm/min densified from 50% to $>$ 98% of theoretical density in about 15 seconds. Grain growth continued with an apparent grain growth rate constant on the order of $10^{-12} cm^3/s$, which is consistent with an extrapolation of lower temperature grain growth data for dense material of similar composition. The final grain size was on the order of 4 μm. Ultra-rapid sintering has also been observed in specimens passed rapidly through a short high temperature furnace without a plasma. (14 refs.)

68494 Influence of sintering temperature of WMn layer on structure and strength properties of ceramic-to-metal seals. A.J.Grodzinski (Inst. of Electronic Materials Technol., Warsaw, Poland).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.533-8
Seals between corundum ceramics with 97.5% content of Al_2O_3 and an FeNiCo alloy were studied. The seals were produced by a high temperature metallizing process. The analysis produced evidence of a definite relation between technological conditions of seal production processes and the seal strength. The following chemical composition of metallic paste is as optimum for mechanical strength: 74.3% of W+15% of Mn+10.5% of lithium glass+0.2% Ni. Based on the thickness of layers left on the ceramics after the mechanical strength test, is concluded that the seals break in the metallic layer, near the boundaries of the spinal phase. (15 refs.)

68495 The terminal layers in the 'ceramics-metal' joints after sintering. W.Wlosinski (Electronic Materials Inst. of Technol., Warsaw, Poland).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.539-44
The division of intermediate layers arising from mechanical coherence, moistening and dissolution, reactive diffusion, diffusion coherence, changes of oxides in the layer-was given. The general conditions of forming the intermediate layers were given. The intermediate layers, arising between Al_2O_3 and metals, between αAl_2O_3 and βAl_2O_3, and between Al_2O_3 and Cr were handled in detail by giving the conditions of forming the layers. (11 refs.)

68496 Properties of MoMn layers sintered on corundum ceramics. W.Olesinska (Inst. Technol. Materialow Elektronicznych, Warszawa, Poland).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.545-50
Investigated processes of diffusion of components from metallic layers as well as from corundum substrates which occur during sintering of MoMn metallic layers with SiO_2 additive on leucosapphire and on material with 95% content of Al_2O_3. The influence of the SiO_2 additive on the metallic layer structure and on the basic properties of ceramic-metal seals, i.e. vacuum tightness and mechanical strength is discussed. The author has defined favourable weight proportions of Mn and SiO_2 to be used as additives for sintering of metallic layers on corundum substrates which are designed for ceramic-metal seals characterized by reproducible functional parameters. (10 refs.)

68497 Examination of the densification processes and the structure formation in short-time sintering of cemented carbides. W.Hermel, R.Krumphold, G.Leitner, S.Siegel (Zentralinst. fur Festkorperphys. und Werkstofforschung, Akad. der Wissenschaften, Dresden, Germany), K.Voigt.
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.579-84
Examination of the influence of temperature and time on the densification of WC-TiC-Co cemented carbides (7 wt.% Co) shows that by thermal activation and inductive rapid heating practically full density may be achieved after sintering times of a few minutes. The values of hardness and strength correspond to those of conventionally long-time sintered specimens. The particularities of structure formation in short-time sintering and the possibilities of their utilization are discussed. (14 refs.)

68498 Feasibility of directional solidification of lanthanum hexaboride in a boron matrix. K.V.Logan (Engng. Experiment Section, Georgia Inst. of Technol., Atlanta, GA, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.195-204
Attempts were made to directionally solidify lanthanum hexaboride as uniformly spaced rods, less than one micron in diameter, in a boron matrix. Lanthanum hexaboride and boron powders were combined in a near eutectic mixture, formed into right circular cylinders and melted by RF induction heating in a pure hydrogen atmosphere using a modified internal zone melting technique. Ball milling, uniaxial cold pressing, isostatic pressing and hot pressing were investigated as possible means of increasing the sample density before melting in the RF induction furnace. RF coupling was achieved directly in the hot pressed pellet, and indirectly through the use of a molybdenum preheater in the uniaxially cold pressed pellets. Internal zone melting and conventional crucible melting in various materials were tried. Directional growth was observed in the pellets that were uniaxially cold pressed and preheated with a molybdenum tube sleeve. Lanthanum hexaboride fibers with an l/d ratio of about ten to one and other forms of aligned microstructures were observed in selected areas of the pellet. (5 refs.)

81.20P Glasses

68499 Monolithicity of silane gels. M.Prassas, J.Phalippou, J.Zarzycki (Lab. de Science des Materiaux, Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.257-60 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The gels obtained by hydrolysis and polycondensation of tetramethoxysilane can be conserved under monolithic shape by controlling the drying step. Three methods for drying the gels are presented here. They give rise to materials, the texture and physical properties of which are very different. The structural evolution and monolithicity as a function of temperature show that only the dehydrated gels, using hypercritical evaluation of the solvent, are possible to be transformed into glasses. (4 refs.)

68500 Thermal evolution of alkali aluminosiicate gels. T.Woignier, J.Phalippou, J.Zarzycki (Lab. des Sci. des Materiaux, Univ. de Montpellier II, Montpellier, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.261-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The gels of composition K_2O-Al_2O_3-$6SiO_2$, Na_2O-Al_2O_3-$6SiO_2$, Li_2O-Al_2O_3-$6SiO_2$ were prepared following two different techniques. destabilization of a colloidal solution of silica and hydrolysis, and polycondensation of $Si(OCH_3)_4$. Al_2O_3, Na_2O, K_2O, Li_2O were added in the form of nitrates in aqueous solution. The crystallization of these gels was studied as a function of temperature by X-ray diffraction. At low temperature all these gels show characteristic X-ray peaks and also IR bands due to the presence of different nitrates. These nitrates however decompose at higher temperatures: consequently, the structure becomes amorphous. At more elevated temperature the gel containing KNO_3 shows a weaker tendency to crystallize. The contraction of the gel was found to be important at low temperatures as observed by dilatometry measurements. (9 refs.)

68501 Directionally crystallized potassium silicate glass-ceramic. G.Lu, L.C.Klein (Ceramics Dept., Rutgers State Univ. of New Jersey, Piscataway, NJ, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.231-40
Glasses in the potassium silicate system were directionally crystallized in a temperature gradient furnace. A composition of approximately 40 wt.% K_2O and 60 wt.% SiO_2 was used. Quenched glass samples were placed in alumina crucibles with $K_2O.2SiO_2$ seed crystals on the bottom surface. The crucible was translated from the hot zone to the cold zone of the furnace. A thermal gradient of 14°C/mm was maintained. Sample height was about 6 mm and translation rates were about 5 mm/h, 1.33 mm/h and 0.83 mm/h. Well-aligned crystals were observed to grow from the bottom of the crucible. Individual crystals were about 0.07 mm wide and extended the length of the crucible parallel to the thermal gradient. The degree of alignment was found to depend on initial temperature and translation rate. The samples have been studied using primarily optical microscopy. (11 refs.)

81.30B Phase diagrams of metals and alloys

68502 A phase diagram of the alloys of the samarium-nickel binary system. Pan Yu-ying, Zheng Jian-Xuan (Dept. of Phys., Guangxi Univ., China).
Acta Phys. Sin. (China), vol.32, no.1, p.92-5 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The samarium-nickel binary system has been studied by X-ray diffraction, differential thermal and metallographic analyses. The phase diagram has been determined. In the system the following eight intermetallic compounds were observed: Sm_3Ni (decomposes at 664°C), SmNi (M.P. 1079°C), $SmNi_2$ (decomposes at 1034°C), $SmNi_3$ (decomposes at 1135°C), Sm_2Ni_7 (decomposes at 1220°C), $SmNi_4$ (decomposes at 1282°C), $SmNi_5$ (M.P. 1430°C), and Sm_2Ni_{17} (decomposes at 1288°C). Three eutectics occur: Sm_3Ni-SmNi (570°C, ~32 at%Ni), SmNi-$SmNi_2$ (809°C, 53.5 at%Ni) and Sm_2Ni_{17}-Ni (1280°C, 94 at%Ni). Neither Sm in Ni nor Ni in Sm shows any detectable solid solubility. (13 refs.)

68503 Synthesis of alloys and phase diagram of the Cs-Te system. K.A.Chuntonov, A.N.Kuznetsov, V.M.Fedorov, S.P.Yatsenko (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.937-40 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1108-12 (July 1982). [received: Feb. 1983]
The phase diagram of the Cs-Te system over the entire range of concentration was constructed. The components interact to give Cs_2Te, Cs_3Te_2, Cs_5Te_4, CsTe, Cs_2Te_3, Cs_2Te_5, and $CsTe_5$, which melt at 821, 660, 465, 408, 395, 235, and 263°C, respectively. It is shown that the tendency of the alloys of the Cs-Te system to form glasses and the large difference in the molar volumes of the components lead to the development of significant deviations from the typical schemes of distribution of the components during solidification of alloys under conditions of directed heat removal. (8 refs.)

68504 Phase diagrams of binary systems of germanium with sodium, potassium, rubidium, and cesium. M.E.Drits, V.F.Potemkin, L.L.Zusman (A.A. Baikov Inst. of Metall., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.7, p.969-71 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1148-50 (July 1982). [received: Feb. 1983]
By means of differential thermal analysis, local X-ray spectral analysis, and quantitative microstructure analysis, a study has been made of the phase diagrams of the systems Ge-Na, Ge-K, Ge-Rb, and Ge-Cs. (7 refs.)

68505 Isotopic effects in hydrogen-intermetallic compounds systems. B.Andreyev, V.Shitikov, E.Magomedbekov, A.Shafiev (Moscow D.I. Mendeleev Inst. of Chem. & Technol., Moscow, USSR).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.161-8 (April 1983).
The isotopic equilibrium of hydrogen in the H-$LaNi_5$ and H-$SmCo_5$ systems was studied at pressures of up to 2.5 MPa and a temperature of 273K. The dependence of the separation factor on the isotopic composition of hydrogen was determined. The thermodynamic parameters of tritium sorption in $LaNi_5$ and $SmCo_5$ were calculated. (21 refs.)

68506 Solid-liquid-equilibria in the α-range of copper-antimony alloys. T.Hehenkamp, R.Kossak (Inst. fur Metallphys., Univ. Gottingen, Gottingen, Germany).
Z. Metallkd. (Germany), vol.74, no.4, p.195-8 (April 1983). In German.
Employing a sensitive differential calorimeter the solidus as well as the liquidus temperatures in the α-range of solid solubility have been determined for the copper-antimony system. Strong deviations from the data published so far have been detected. (14 refs.)

68507 Thermodynamic properties of binary alloys of platinum metals. III. Iridium-rhodium. S.N.Tripathi, M.S.Chandrasekharaiah (Reactor Chem. Section, Bombay, India).
Z. Metallkd. (Germany), vol.74, no.4, p.241-5 (April 1983).
The activity of Ir as a function of composition in Ir-Rh alloys at 1443, 1461 and 1511K was determined from equilibria measurements with volatile iridium oxides. Other thermodynamic properties were than evaluated. This binary system exhibits a large negative deviation from ideal solution model and the results strongly indicate the possible miscibility gap. (11 refs.)

68508 Microstructures of the alloys in the system Pd-In-Sn. M.Abdullah, I.Kosovinc (Lehrstuhl fur Metallografie, Univ. Ljubljana, Ljubljana, Yugoslavia), K.Schubert.
Z. Metallkd. (Germany), vol.74, no.4, p.250-3 (April 1983).
The microstructures of Pd-In-Sn alloys are studied with the help of electron probe microanalysis. The phase diagram is confirmed and the morphology found is compatible with the knowledge on crystal structures. (9 refs.)

68509 The influence of alloy chemistry on controlling fiber volume fraction in Ni-base MC aligned eutectics. M.R.Jackson, J.L.Walter (General Electric Corporate Res. & Dev., Schenectady, NY, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.103-13
For the Ni-base TaC eutectics, it has been shown previously that carbide volume fraction is a strong function of Ta/C ratio. Now in a number of Ni,Cr-TaC and Ni,Cr,Al-TaC alloys, Cr has been observed to have only a small influence on volume fraction of carbide, while Al has a major influence acting to decrease the volume fraction. The Al present in the matrix causes the phase equilibrium to approach that of a much greater Ta/C ratio. This analysis has been extended to more complex NiTaC alloys as well. For the simple Ni-Cr-Ta-C alloys, creep behavior has been studied as a function of volume fraction of carbide. Other carbide systems have been evaluated as well, including TiC and NbC. A general understanding of volume fraction differences between these systems and TaC can be reached by consideration of ideal solution behavior and the appropriate phase diagrams. (10 refs.)

68510 Selective etching and laser melting studies of monotectic composite structures. L.M.Angers (Northwestern Univ., Evanston, IL, USA), R.N.Grugel, A.Hellawell, C.W.Draper.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.205-16
Thin slices of directionally solidified, fibrous composite, monotectic alloy samples have been selectively etched to remove the fibrous phase, so to produce fine sieves of filters having pore dimaters ≤10μm. Alloys in systems Al-In, Al-Bi and CuAl-Pb have been examined using as etchants aqueous nitric acid (Al-In, Al-Bi) and aqueous citric acid (CuAl-Pb) without applied anode voltages. These alloys and etchants illustrate examples in which fiber and matrix are attacked to different extents (Al-In), the phase interface is selectively attacked (Al-Bi) or only the fibers are attacked (CuAl-Pb). Hole sizes and perfection are compared for etching times, concentrations and anode voltage. Laser melting of the surface of CuAl-Pb samples has been used to screen or

frame areas of the composite microstructure and also shows how local melting of the fibrous Pb phase can be used to assess the heat affected zone. (6 refs.)

68511 Phase equilibria in the system Na_2CO_3-$CaCO_3$-CO_2 at 750 to 900°C. P.Taskinen, D.Janke.
Arch. Eisenhuettenwes. (Germany), vol.54, no.2, p.53-5 (Feb. 1983).
The phase diagram of the binary system Na_2CO_3-$CaCO_3$ is presented. Determination of solid state phase equilibria by thermal analysis at 750 to 900°C and $p_{CO_2}=1$ bar, is described. (22 refs.)

68512 The *P-T* phase diagram of lithium iodate ($LiIO_3$) up to 40 kbars. Shen Zhong-yi, Liu Jun, Zhang Yun, Yin Xiu-jun, He Shou-an (Inst. of Phys., Acad. Sinica, Peking, China).
Acta Phys. Sin. (China), vol.32, no.1, p.118-23 (Jan. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The possible high pressure modifications of lithium iodate ($LiIO_3$) were surveyed in the high pressure and high temperature ranges up to 40 kbar and 750°C. Two high pressure modifications have been observed. The first is found in the range of 1.5-4.9 kbars and 310-450°C, while another appears in the pressure range above 15 kbars. The phase boundaries were determined by DTA and quenching method. The diagram published abroad in 1969 have been corrected and the stability of each phase at high pressures and high temperatures has been discussed. (16 refs.)

68513 High-temperature interaction of hafnium nitride with tungsten. S.P.Kogel', R.G.Avarbe, M.A.Eron'yan, Yu.P.Malkov.
Inorg. Mater. (USA), vol.18, no.5, p.683-6 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.812-15 (May 1982). [received: Feb. 1983]
Hafnium nitride is one of the especially refractory compounds. The dependence of the temperature of eutectic interaction of tungsten with hafnium nitride on the nitrogen pressure and oxygen content in the nitride was established experimentally. At a nitrogen pressure >1 MPa, the temperature limit of compatibility of these materials is close to the melting point of tungsten. (6 refs.)

68514 Nature of the interaction between lead and zinc chalcogenides. G.S.Oleinik, P.A.Mizetskii, A.I.Nizkova (Inst. of Semiconductors, Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.5, p.734-5 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.873-4 (May 1982). [received: Feb. 1983]
Presents the results of investigations of the phase diagrams of the PbS-ZnS, PbSe-ZnSe, and PbSe-ZnS systems; the latter is the diagonal cross section of the ternary mutual system $PbSe+ZnS \rightleftharpoons PbS+ZnSe$. The starting materials used were special purity grade; lead sulfide and selenide were produced by direct synthesis from the elements. The points of the liquidus curve of the indicated systems were determined by differential thermal analysis. (4 refs.)

68515 PbTe-Ge section of the Pb-Ge-Te ternary system. N.P.Burmistrova, R.G.Fitseva, N.R.Faizullina, V.A.Mullina (V.I. Ul'yanov-Lenin Kazan State Univ., Kazan, USSR).
Inorg. Mater. (USA), vol.18, no.5, p.737-8 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.876-7 (May 1982). [received: Feb. 1983]
Alloys of the investigated section were synthesized from the starting components in a furnace with vibrational mixing. The samples obtained were annealed at 850°C for 300 h. To determine the solubilities at room temperature, the samples, after annealing, were cooled slowly under conditions involving switching off of the furnace. To ascertain the maximal solubilities the alloys annealed at the eutectic temperature (865°C) were quenched in cold water. The alloys obtained were investigated by physicochemical analysis. The phase diagram of the PbTe-Ge system was constructed from the results of differential thermal, X-ray diffraction, and microstructural analysis and measurements of the microhardnesses. (no refs.)

68516 Investigation of the p-T-x diagram of the Sn-Se system. E.A.Aleshina, V.P.Zlomanov, A.V.Novoselova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.765-7 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.913-16 (June 1982). [received: Feb. 1983]
The p-T-x phase diagram of the Sn-Se system was constructed in the form of p-T, T-x, and p-x projections. The equations of the lines of the two- and three-phase equilibria are presented. The parameters of the model of the associated melt that participates in the $S(SnSe_2)+L+V$ three-phase equilibrium were determined. (7 refs.)

68517 The AsSe-TlSe system. V.V.Kirilenko, V.A.Samokhov, N.G.Velikova, R.N.Shchelokov, A.V.Medvedev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.768-73 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.917-22 (June 1982). [received: Feb. 1983]
The phase diagram of the AsSe-TlSe cross section of the Tl-As-Se system was studied by DTA, XRPA and microstructural methods and by measuring the microhardness. It was shown that this cross section is pseudobinary. Two chemical compounds were detected, one, the already known $TlAsSe_2$, melting congruently at 528K, and the second, Tl_3AsSe_4, formed by a peritectic reaction at 508K. The phase diagram is characterized by the presence of two eutectics in the phase separation region in the liquid state. The glass transition temperature of the amorphous alloys was determined and calculated. It was shown that the method for calculating T_g, generally used in the chemistry of high-molecular-weight compounds, may serve for the preliminary evaluation of the nature of the chemical reaction in chalcogenide glass-forming systems. The interrelationship between the extent of the glass formation region, the structure of the glass, and the character of the phase diagram of the AsSe-TlSe system has been confirmed. (18 refs.)

68518 The $TlAsSe_2$-Se system. V.V.Kirilenko, V.A.Samokhov, N.G.Velikova, R.N.Shchelokov, A.V.Medvedev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.773-9 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.923-9 (June 1982). [received: Feb. 1983]
The $TlAsSe_2$-Se cross section of the Tl-As-Se system was studied by DTA, X-ray phase analysis and microstructural methods, and by measuring the microhardness. It was shown that this cross section is pseudobinary. The chemical compound $Tl_2As_2Se_5$ was observed, which is formed by a peritectic reaction at 220°C. The phase diagram is also characterized by the presence of an eutectic and phase separation region in the liquid phase. The glass-tansition temperature of amorphous alloys was studied. It was suggested that the method for calculating T_g, generally accepted in the chemistry of high-molecular-weight compounds, could be used in the case of these alloys, and might serve for the preliminary evaluation of the nature of the chemical reaction in chalcogenide glass-forming systems. The interrelationship between the structure of the glass and the character of the phase diagram of the $TlAsSe_2$-Se system was studied. (22 refs.)

68519 Section of the phase diagram of the In_2Te_3-Fe system in the vicinity of In_2Te_3 and thermodynamic investigation of nonionized impurity atoms in crystals with stoichiometric vacancies. E.E.Ovechkina, V.V.Kukol' (All-Union Sci.-Res. Inst. of Single Crystals, Scintillation Materials & Ultrapure Chem. Substances, USSR).
Inorg. Mater. (USA), vol.18, no.6, p.786-8 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.939-41 (June 1982). [received: Feb. 1983]
The section of the phase diagram of the In_2Te_3-Fe section of the In-Te-Fe system in the vicinity of In_2Te_3 was constructed by means of DTA, XDA, microstructural analysis, and measurements of the microhardnesses. It was established that all of the investigated impurities in In_2Te_3 are localized in the stoichiometric vacancies in the atomic state. (11 refs.)

68520 Quaternary interacting $A^{II}B^{VI}$ semiconductor systems. V.N.Tomashik, N.B.Mizetskaya, P.F.Vengel' (Semiconductor Inst., Acad. of Sci., Ukrainian SSR).
Inorg. Mater. (USA), vol.18, no.6, p.799-801 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.953-5 (June 1982). [received: Feb. 1983]
Use of thermodynamic calculations showed that one of the stable diagonal cross sections of ternary interacting systems forming a quaternary interacting system determines the position of the stable diagonal cross sections of the quaternary interacting system. The theoretical predictions for the Cd, Zn$\|$S, Se, Te system were confirmed experimentally. (10 refs.)

68521 Interaction in Ga_2S_3-Y_2O_3 and In_2S_3-Y_2O_3 systems. P.G.Rustamov, I.B.Bakhtiyarov (Inst. of Inorganic & Phys. Chem., Acad. of Sci., Azerbaidzhan SSR).
Inorg. Mater. (USA), vol.18, no.6, p.801-4 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.956-9 (June 1982). [received: Feb. 1983]
Physicochemical analytical methods were used to study the Ga_2S_3-Y_2O_3 and In_2S_3-Y_2O_3 systems. These systems are eutectic. The Y_2O_3 solubility at room temperature is 3 and 6.5 mole % in Ga_2S_3 and In_2S_3, respectively. (7 refs.)

68522 Study of the SnO_2-Ta_2O_5 system and preparation of tin tantalates and niobates. T.I.Panova, E.P.Savchenko, E.N.Isupova (I.V. Grebenshchikov Inst. of Silicate Chem., Acad. of Sci., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.852-5 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1013-16 (June 1982). [received: Feb. 1983]
A phase diagram is constructed for the SnO_2-Ta_2O_5 system, and reveals the presence of a binary eutectic and of narrow regions of solid solutions based on SnO_2 and Ta_2O_5. The compounds $SnNb_2O_6$ and $SnTa_2O_6$, which contain tin in the divalent state, are synthesised. (6 refs.)

68523 Interaction in the Bi_2Te_3-La_3Te_4 system. P.G.Rustamov, F.M.Sadygov, Ch.I.Abilov (Inst. of Inorganic & Phys. Chem., Acad. of Sci., Azerbaidzhan SSR).
Inorg. Mater. (USA), vol.18, no.7, p.949-51 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1123-5 (July 1982). [received: Feb. 1983]
A study of the interaction in the Bi_2Te_3-La_3Te_4 system showed that the phase diagram of the Bi_2Te_3-La_3Te_4 system is of the simple eutectic type with limited solubility on the basis of Bi_2Te_3; the region of homogeneity at room temperature extends to 3 mole% La_3Te_4. The temperature dependences of the thermoelectric parameters of $(Bi_2Te_3)_{i-x}(La_3Te_4)_x$ solid solutions ($x \leq 0.03$) were investigated. (9 refs.)

68524 Stabilization of the compound $12CaO.7Al_2O_3$ and its derivatives. G.I.Zhmoidin, G.S.Smirnov.
Inorg. Mater. (USA), vol.18, no.7, p.1003-7 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1189-93 (July 1982). [received: Feb. 1983]
The matrix compound and its derivatives have been studied for a case where a mole of CaO is replaced by CaF_2 or CaS with a view to clarifying the mechanism of stabilization of the structure of the compound $12CaO.7Al_2O_3$. Quasibinary sections representing the matrix compound and its derivatives as well as the fluoride and sulfide derivatives have been constructed. The measured density of the fluoride and sulfide derivatives is less than the X-ray density for the same specimens. The measured density of the crystals of the matrix compound is 0.45% higher than the X-ray density, this being explainable by the presence of crystal-stabilizing oxygen-containing gases in the structure. Only 0.06% of gases consisting of H_2O, CO_2, O_2, and CO is sufficient for the stabilization of the $12CaO.7Al_2O_3$ structure. In the fluoride and sulfide derivatives the structure stabilization is achieved by replacing a part of the oxygen anions by fluorine and sulfur. (12 refs.)

68525 The system SrO-Nb_2O_5. P.P.Leshchenko, A.V.Shevchenko, L.N.Lykova, L.M.Kovba, E.A.Ippolitova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.1013-16 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1202-5 (July 1982). [received: Feb. 1983]
Phase equilibria in the SrO-Nb_2O_5 system were investigated in a wide temperature range and a t vs x diagram was constructed. Six individual compounds, viz. $Sr_6Nb_2O_{11}$, $Sr_4Nb_2O_9$, $Sr_5Nb_4O_{15}$, $Sr_2Nb_2O_7$, $SrNb_2O_6$, and $Sr_2Nb_{10}O_{27}$, are formed in the system. Below 1300°C the strontium niobate $Sr_6Nb_2O_{11}$ has a homogeneity region which does not include the stoichiometric composition. The parameters of the unit cells of all the strontium niobates synthesized were determined. (13 refs.)

68526 Fine-grain iron-silicon and iron-silicon-aluminum alloys obtained by cooling from the liquid state. A.M.Glezer, B.V.Molotilov, B.Ya.Pluchek, V.V.Sosnin (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.74-80 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.701-9 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The structure, texture, and mechanical and magnetic properties of the alloys Fe-9.6 wt.% Si-5.4 wt.% Al and Fe-6 wt.% Si, obtained in the form of thin strips by cooling from the molten state, are investigated. It is shown that defect structure formed on cooling determines the properties of these alloys to a considerable extent. (8 refs.)

68527 Structural and compositional variations in aluminium alloys rapidly quenched from the melt. J.A.Van Der Hoeven, P.Van Mourik, E.J.Mittemeijer (Lab. for Metall., Delft Univ. of Technol., Delft, Netherlands).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.158-60 (April 1983).
The relation between the local concentration of the alloying element and the microstructure has been investigated for AlSi and AlMg alloy melt spun ribbons. It has been found that there is a close relationship between solidification structure and composition and that the ribbon centre solidifies first. (3 refs.)

68528 Investigation of conditions of $TiBiTe_2$ formation. N.S.Popovich, V.K.Shura, D.V.Gitsu (Inst. of Appl. Phys., Moldavian Acad. of Sci., Kishinev, USSR).
J. Cryst. Growth (Netherlands), vol.61, no.2, p.406-8 (March 1983).
Applying X-ray diffraction, different thermal and microstructural analyses phase interactions in the Tl_2Te-Bi_2Te_3 section was investigated and the phase diagram was derived. It was shown that $TlBiTe_2$ compound is formed by peritectic reaction at 520°C and that it presents a variable composition phase having a temperature interval of crystallization of about 30°C. The given diagram explains the controversy existing in reference literature in relation to the melting temperature and some other properties of $TlBiTe_2$ and also the difficulty of obtaining crystals of this compound. (12 refs.)

68529 A study on the melting morphology of cast iron according to graphite shape. Chang Hee Lim, Hyong Yong Ra (Coll. of Engng., Seoul Nat. Univ., Seoul, Korea).
J. Korean Inst. Met., vol.20, no.12, p.1090-8 (Dec. 1982). In Korean.
The melting has been done by rapid melting method and melting morphology has been examined, according to graphite shape in cast iron. In white cast iron of Fe-C-Si system, the melt appears first along the interface between temper carbon and austenite matrix, after the minute temper carbon which was decomposed from Fe_3C diffuses to austenite to eutectic composition. In either hypo or hyper-eutectic gray cast iron, it is observed that the melt appears first at the boundary of eutectic cell. In case of the eutectic gray cast iron, the vicinity of all graphites melts at the same time. In rapidly heated and water quenched specimen of hypereutectic gray cast iron, the crystallization of fine graphites near kish graphite leads to the conclusion that kish graphite does not dissolve easily. In case of nodular cast iron, the boundary between austenite shell and austenite matrix melts first and nodular graphite dissolves very slowly. (16 refs.)

68530 Morphology of primary carbides in niobium-containing variants of M2 high speed steel. R.Riedl, S.Karagoz (Inst. fur Metallkunde und Werkstoffprufung, Montanuniv., Leoben, Austria), H.Fischmeister.
Z. Metallkd. (Germany), vol.74, no.4, p.199-205 (April 1983). In German.
Unidirectional solidification was used to study the influence of niobium on morphology and compositon of carbides formed in the as-cast state of high speed steel S 6-5-2, whose vanadium was replaced with varying amounts of niobium. The carbides are eutectic M_6C and MC and also primary MC. The latter are niobium rich and attain considerable size. Depending on the cooling conditions, the initial octahedral shape of the primary MC crystals changes to star shape or to hopper shape. The eutectic MC carbide grows along ⟨100⟩ directions, taking its orientation from the primary MC crystals. The eutectic crystallization of M_6C proceeds first in a coupled fashion, producing a lamellar morphology, but later the carbide phase overtakes the austenite and the coupling breaks down. Because of the tendency to form large MC crystals, niobium additions in ingot-processed high speed steels of this type should be limited to below ca. 1.5% and vanadium should not be entirely left out. (63 refs.)

68531 Solidification and strength characteristics of Ni-Cr-Ti and Co-Cr-Mo eutectics. M.K.Thomas (Naval Air Dev. Center, Warminster, PA, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.181-93
The results of an exploratory study of eutectics based on Ni-25Cr-15Ti (wt.%) and Co-10Cr-32Mo compositions will be presented. These alloys were selected from a total of ten different eutectic systems, all having melting points above 1200°C, a specific gravity less than 9000 kg/m^3, and a parabolic oxidation rate below 10^{-7} $g^2.cm^{-4}.s^{-1}$ at 1150°C. The Ni-25Cr-15Ti eutectic appeared to have a high volume fraction of ductile chromium fibers in a brittle Ni_3Ti matrix. Its tensile strength at 1093°C was 227 MPa^2 and its elongation was 14%. The Co-10Cr-32Mo eutectic had the highest melting point (1340°C) of the alloys screened. It appeared to solidify in a basically blade-like or lamellar structure, consisting of the intermetallic μ phase in a metallic Co (Cr) matrix. The strongest of the Co-Cr-Mo eutectics tested had a tensile strength of 164 MPa and an elongation of 15% at 1093°C. The correlation observed between the strengths of the Ni-Cr-Ti and Co-Cr-Mo alloys, compositional variations, and their microstructures will be discussed. (21 refs.)

68532 In situ electron microscopy: solidification of eutectic alloys. C.Lemaignan, J.Pelissier (Dept. de Metallurgie de Grenoble, Centre d'Etudes Nucleaires de Grenoble, Grenoble, France).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.241-51
A heating stage and an advanced video recording system were used in the 1 MeV electron microscope of CEN Grenoble. This allowed us to observe various aspects of eutectic solidification. These observations include regular lamellar solidification with faceted or nonfaceted solid-liquid interfaces, change of lamellar spacing with solidification rate, nonreciprocal heterogeneous nucleation of eutectic solidification. The authors discuss them with respect to the classical theories and introduce a new eutectic nucleation mechanism based on surface dendrites. (14 refs.)

68533 Microstructural perturbations in directionally solidified Al-In, Al-Bi and Zn-Bi monotectic alloys. B.Toloui, A.J.Macleod, D.D.Double (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.253-66
Studies have been made of the microstructures developed in directionally solidified monotectic Al-In, Al-Bi and Zn-Bi alloys, as a function of growth velocity and temperature gradient. With increasing growth velocity and decreasing gradient the microstructures show transitions from regular rod-like arrangements of the lower melting point phase, through arrays of aligned droplets to coarse irregular droplet dispersions. Intermediate stages show rods with longitudinal shape perturbations of a classic Rayleigh-type instability. The changes are discussed in terms of oscillatory instabilities at the solid-liquid interface (enhanced by increasing growth velocity and decreasing temperature gradient) coupled with ripening effects in the solid+liquid region behind the interface. (16 refs.)

81.30H Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder

(see also 64.70K Solid-solid transitions)

68534 Phase transformations in ferrosilicon and their influence on inhibitor-phase formation. A.A.Kononov, B.M.Mogutnov, A.V.Sumin, M.P.Usikov, L.A.Shvartsman (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.81-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.710-13 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The $\alpha \rightarrow \gamma$ transformation in ferrosilicon, which has a significant influence on the solubility of inhibitor phases (MnS and AlN) in α-Fe and on the kinetics of their subsequent precipitation, is investigated. The volume fraction of austenite at the temperatures of normalization and hot rolling is determined. (5 refs.)

68535 Investigation of the kinetics of the polymorphic transition and their influence on the mechanism of sintering of aluminum oxide. I.I.Spivak, V.N.Rystsov.
Inorg. Mater. (USA), vol.18, no.7, p.984-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1166-71 (July 1982). [received: Feb. 1983]
The kinetic laws of the polymorphic transition of γ-Al_2O_3 obtained by roasting aluminum hydroxide are established. In the absence of external pressure no compaction is observed in the polymorphic transition of Al_2O_3, indicating that the forces arising in regrouping of the particles as a result of the $\gamma \rightarrow \alpha$ transition are greater than those due to sintering. In using γ-Al_2O_3 powders, a marked increase in final density can be obtained by realizing a high degree of cold compaction of the γ-Al_2O_3 powders ($\rho_0 > 50$-60%), which raises certain difficulties. (11 refs.)

68536 A high-temperature phase transition in $Pb_2Bi_6O_{11}$. G.A.Bordovskii, N.I.Anisimova (A.I. Gertsen Leningrad State Pedagogical Inst., Leningrad, USSR).
Inorg. Mater. (USA), vol.18, no.7, p.1016-18 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1206-8 (July 1982). [received: Feb. 1983]
Two phases (α and β) are found for $2PbO.3Bi_2O_3$ with a phase transition point at 873±5K. Both phases may coexist at room temperature and normal pressure. The α-phase is metastable below the phase transition temperature. The phase transition found may be considered a polymorphic transformation between two $Pb_2Bi_6O_{11}$ modifications. However, it is not excluded that the phase transition may also be related to the formation of a solid solution upon the decomposition of the metastable α-modification. (11 refs.)

68537 Variation of electrical resistivity in FeCo alloy on isochronal ordering. Y.Tahara (Miyakonojo Tech. Coll., Miyakonojo, Japan), K.Oki, T.Eguchi.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.279-84 (April 1983). In Japanese.
The kinetics of isochronal ordering in FeCo alloy was investigated with the measurement of the temperature derivative of electrical resistivity α_R. The temperature derivative of electrical resistivity caused by only the order or disordering, $\Delta\alpha_R$, was estimated by eliminating other effects such as the magnetic and phonon scattering effect. The kinetic equation of ordering was applied to the case of ordering on heating with constant velocity. The variations of $\Delta\alpha_R$ of the alloy on heating at various rates, initially quenched from various temperatures, were analyzed using the expanded rate equation. In the analysis the values of 230 kJ/mol and 0.98×10^{13} s^{-1} were taken for the activation energy and the atomic frequency, respectively. (11 refs.)

68538 Thermal annealing of doubly oriented nylon 11 in contact with formic acid. M.Dosiere, J.J.Point (Univ. de l'Etat a Mons, Mons, Belgium).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.625-45 (April 1983).
The most striking feature of the mechanism of thermal annealing of doubly oriented samples of low-density polyethylene (LDPE) and probably of high-density polyethylene (HDPE) is a progressive tilt of lamellar crystals around their crystallographic *b* axis. Such a rotation does not occur on thermal annealing in doubly oriented nylons. However, this rotation mechanism occurs during the thermal annealing of doubly oriented samples of nylon 11 in contact with a solvent below its dissolution temperature. As for oriented samples of polyethylene (PE), a correlation between the changes of macroscopic dimensions and long spacing obtained from tne small-angle X-ray pattern is difficult to establish. In doubly oriented samples of nylon 11, the basal faces of the lamellar crystals are parallel to the *a* axis of the unit cell. Nevertheless, simple Miller indices cannot be assigned to the basal planes of the lamellae. On thermal annealing in formic acid, the basal planes of the lamellar crystals are, in some cases, parallel to (00*l*) planes. Annealing in formic acid at room temperature induces a phase transition: the chain *c* axis remains oriented along the rolling direction and the (00*l*) planes become parallel to the limiting planes of the lamellar crystals. 68539 Stress-induced transformations in composite zirconia ceramics. M.Ruhle, W.M.Kriven (Inst. fur Werkstoffwissenschaften, Max-Planck-Inst. fur Metallforschung, Stuttgart, Germany).
Ber. Bunsenges. Phys. Chem. (Germany), vol.87, no.3, p.222-8 (March 1983).
The microstructure, transformation mechanisms, elastic strain distribution, and in-situ studies of the interaction of the confined zirconia particles with the stress field of the crack tip have been studied by means of high voltage transmission electron microscopy techniques. Facetted particles below a critical size d_c are retained metastably down to room temperature. The transformation is predominantly controlled by a nucleation barrier. A model of nucleation by inhomogeneity of internal strains is postulated. The 'critical size effect' may then be explained in terms of irregular-shaped particles inducing an inhomogeneous internal strain field which scales with particle size and has a well-defined d_c. (28 refs.)

68540 Volt-ampere characteristics of metastable corona electrodes [martensitic transformation]. Yu.B.Peisakhov, V.I.Tambovtsev, V.K.Usachev.
Elektron. Obrab. Mater. (USSR), no.1, p.45-7 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
A study was made of the volt-ampere characteristics of corona electrodes made from metastable and stable alloys in relation to the $\gamma\rightarrow\alpha$ martensitic transformation. There was found to be an abrupt increase in the slope of the volt-ampere characteristic curve of a static discharger in the case of the use of corona-discharge electrodes made of metastable alloys having an initial microstructure of ferromagnetic martensite. The chief reason for the increased efficiency of the static discharger is the surface micro-relief resulting from the martensitic transformation. (4 refs.) *A.J.B.*

68541 Compositional dependence of transformation temperatures in ternary TiNiAl and TiNiFe alloys. C.M.Hwang, C.M.Wayman (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
Scr. Metall. (USA), vol.17, no.3, p.381-4 (March 1983).
Reports the compositional dependence of transformation temperatures (T_p T_d M_s etc.) in TiNiFe and TiNiAl shape memory alloys using mainly electrical resistance versus temperature measurements between temperature and liquid nitrogen temperature (−196°C). Comparing the transformation temperatures of the alloys used shows that the higher the Al or Fe content, the lower the transformation temperatures. For the purpose of studying charge density wave (CDW) transitions in these alloys, $Ti_{58.7}Ni_{37.5}Al_{3.8}$ is most appropriate, since the incommensurate phase exists over a larger temperature range. In addition, no martensitic transformation takes place in this alloy, which otherwise may interfere with the 'premartensitic' phase at lower temperatures. (15 refs.)

68542 Microstructural features of charge density wave (CDW) and martensitic transformations in TiNiFe and TiNiAl alloys. C.M.Hwang, C.M.Wayman (Dept. of Metall. & Mining Engng., Univ. of Illinois, Urbana, IL, USA).
Scr. Metall. (USA), vol.17, no.3, p.385-8 (March 1983).
Describes the product phase of the second phase transition observed in TiNiFe and TiNiAl shape memory alloys, which exhibits some features similar to those characteristic of thermoelastic martensite. (5 refs.)

68543 Effect of relaxation of transformation stresses on the martensite points. Yu.I.Paskal', A.G.Repina, Yu.N.Koval', A.A.Tukhfatullin (V.D. Kusnetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.691-4 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.14-17 (Aug. 1982). [received: April 1983]
The effect of dynamic and static relaxation of transformation stresses on martensite points is examined using a nonlocal, nonequilibrium thermodynamic description of martensite transformations. (11 refs.)

68544 Analytical investigation of the precipitation of nitrides in steel. M.Kretschmer.
Arch. Eisenhuettenwes. (Germany), vol.54, no.2, p.67-71 (Feb. 1983).
Quantitative determination of the nitrides in steel by methods of analytical chemistry is described. Solution and isolation methods are discussed. Hot extraction with hydrogen is described. Experience of laboratories of the German steel industry and results of working groups are discussed. Examination of a standard sample is outlined. Considerably better evidence of the presence of different nitrides is obtained by combined use of the methods described. (19 refs.)

68545 On the structure of α'_m-precipitates in Al-Zn alloys. M.Werner, H.Loffler (Sektion Math./Phys., Padagogische Hochschule Halle, Halle, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.4, p.459-67 (1983).
The lattice parameter of the f.c.c. α'-phase in an Al-12 at.% Zn alloy decomposed at ageing temperatures ranging between 170°C and 210°C was investigated by an analysis of Moire fringe contrasts which appear inside the precipitates in TEM-micrographs. Additional information was gained concerning the relationship between the corresponding lattice of the α'_m-precipitates and the matrix. The analysis proved that the misfit between the lattice of the α'_m-precipitates and the adjoining matrix is fairly small, namely less than 1.5% in lattice spacing and less than 1° in the angular rotation. From these results it was concluded that the major part of the matrix planes passes the precipitates without interruption. (19 refs.)

68546 X-ray diffraction quantitative analysis of the Heusler alloy $CU_{2.00}Mn_{1.00}Al_{1.00}$ annealed at temperatures between 423 and 973K. R.Kozubski, J.Soltys (Inst. of Phys., Jagellonian Univ., Krakow, Poland).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.141-3 (April 1983).
Powder samples of the alloy $Cu_{2.00}Mn_{1.00}Al_{1.00}$ quenched in water after 20 h of ageing at 1123K were homogeneous, containing wholly the ferromagnetic β-phase with $L2_1$ type structure. These samples were annealed at temperatures below 973K, i.e. in the region of metastability of the β-phase which decomposes into three phases of the types: β-Mn, γ-Cu_9Al_4 and T-Cu_3Mn_2Al. The annealing time and temperature dependences of volume fraction the precipitating phases were obtained using X-ray quantitative analysis. The decomposition sequence is then examined. (5 refs.)

68547 A study of precipitation in AISI type 316 stainless steel. J.K.L.Lai (Technol. Planning & Res. Div., CEGB, Leatherhead, England).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.195-209 (April 1983).
The precipitation behaviour of nine casts of AISI type 316 steels, with aging temperatures ranging from 550 to 815°C and times up to 120000 h has been studied using a newly developed X-ray internal standard technique. At temperatures below 700°C, the data obtained are consistent with the theory that the precipitation of $M_{23}C_6$ is Cr-diffusion controlled and the precipitation of η phase in Fe-diffusion controlled. The precipitation of $M_{23}C_6$, η phase and σ phase occurs in sequence. The onset of η phase precipitation approximately coincides with the completion of $M_{23}C_6$ precipitation, while the precipitation of η phase is complete. A simple explanation based on the relative ease of nucleation of these phases and the competition for nucleation sites can explain the experimental results semiquantitatively. (22 refs.)

81.40 TREATMENT OF MATERIALS AND ITS EFFECTS ON MICROSTRUCTURES AND PROPERTIES

68548 X-ray study of fine structure of Si-$ZrSi_2$ eutectic obtained by oriented crystallization. L.K.Savitskaya, L.S.Derevyagina, L.M.Butkevich, T.N.Safonova (V.D. Kuznetsov Siberian Physicotech. Inst., USSR).
Inorg. Mater. (USA), vol.18, no.7, p.965-8 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1143-7 (July 1982). [received: Feb. 1983]
In the direction parallel to the axis of growth of the eutectic of the Si-$ZrSi_2$ system, the lattice of the silicon matrix is compressed, and the lattice of the $ZrSi_2$ fibers is stretched. In the transverse direction, there are no distortions

of the lattice. By selective etching of the matrix or the fibers, it has been shown that these deformations are elastic. The coherent scattering regions in the silicon matrix are not equiaxial. They are elongated in the direction perpendicular to the growth axis. As the crystallization velocity is increased, the shape of these regions approaches equiaxial. Microdistortions of the second kind in the silicon matrix are anisotropic. In the direction perpendicular to the growth axis, they are considerably larger than in the longitudinal direction. (10 refs.)

68549 Thermal effect of nitrogen implantation on high carbon steels. E.Ramous, G.Principi, L.Giordano (Istituto di Chimica Industriale, Univ. di Padova, Padua, Italy), S.Lo Russo, C.Tosello.
Thin Solid Films (Switzerland), vol.102, no.2, p.97-106 (15 April 1983).
Quenched and annealed samples of a high carbon steel implanted with 105 keV nitrogen at a nominal dose of 3×10^{17} ions cm^{-2} and current densities of 50, 100 and 200 μA cm^{-2} were analysed by a nuclear technique to measure the retained dose. The dose thus measured depends on the beam current density as well as on the initial steel structure: it decreases with the beam current density and is systematically lower in quenched steel than that in the annealed steel. Microhardness measurements and conversion electron Mossbauer scattering were used to study the structural modifications induced by various implantation conditions. The mean implantation temperature of the samples, as evaluated on the basis of the microhardness values and checked by a thermocouple, lies in the tempering range of hardened structures at the above implantation current densities. The metallurgical transformations observed can account for the different amount of retained implanted ions in the first 200 nm below the surface. (17 refs.)

68550 Heat emission during the quenching of a metal in an electrical field. A.A.Skimbov, I.A.Kozhukhar', Yu.A.Shcheglov, A.S.Lymar'.
Elektron. Obrab. Mater. (USSR), no.1, p.42-5 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
The process of quenching a metal in oil in an electrical field is examined. It is found that parts quenched by this new method are harder by 15-16% than similar parts oil-quenched in the absence of an electrical field. It is shown that electro-convection intensifies the process of heat exchange and causes a three-to fourfold increase of the heat transfer coefficient. (6 refs.) *A.J.B.*

68551 Coarsening mechanism between 800° and 1400°C of thorium oxide particles dispersed in a nickel-cobalt matrix. M.Ghodsi, T.Beatse (Univ. Libre de Bruxelles, Bruxelles, Belgium).
Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.387-92
The coarsening of fine thorium oxide particles dispersed in a nickel-cobalt matrix has been studied in a temperature range of 800 to 1400°C and a N_2-4% H_2 atmosphere. In a first stage, densification of the metal phase leads to the formation of oxide clusters which by contact and surface diffusion sinter together. This phenomenon continues at least until a 24 hour treatment at 1000°C and is characterised by the presence of polycrystalline grains which undergo rearrangement and spheroidisation. From 1100°C onward, the Ostwald ripening mechanism, as described by the kinetic law of C. Wagner (1961), is predominant. For these temperatures, the Arrhenius type equation gives an activation energy of growth compatible with a mechanism by diffusion of oxide ions along metal grain boundaries. (8 refs.)

68552 Texture transformations in the recrystallization of the alloy Fe-3% Si. I.V.Gervas'eva, B.K.Sokolov, I.P.Pechkurova, A.G.Zhigalin (Inst. of Metal Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.43-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.669-74 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
Using the distribution function of the orientation, the deformational and recrystallization texture is analyzed by means of the Roe method after single and double rolling of the engineering steel Fe-3% Si. It is shown that the distribution of the orientational density is continuous in character, and the description of such texture by ideal components is incorrect. (13 refs.)

68553 Influence of the matrix structural state on the development and perfection of ribbed texture in secondary recrystallization in the alloy Fe-3% Si. V.Ya.Gol'dshtein, R.L.Gershman, T.A.Komissarova, A.A.Savinskaya (Chelyabinsk Sci. Res. Inst. of Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.49-52 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.675-8 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
An investigation was made of the kinetics of the development of secondary recrystallization and of the features of the initial-matrix structure after decarbonizing annealing of samples of a series of melts showing different levels of magnetic properties after high-temperature annealing (HTA). Comparison of the experimental data on the growth rates of matrix grains initiated by secondary recrystallization and of the features of the initial-matrix structure after decarbonizing annealing of samples of a series of melts showing different levels of magnetic properties after high-temperature annealing (HTA). Comparison of the experimental data on the growth rates of matrix grains initiated by secondary recrystallization and the kinetics of this process with data on the perfection of the developing rib structure leads to the conclusions that the quality of primary recrystallization and when secondary recrystallization occurs intensively. With weak stabilization of the matrix, secondary recrystallization develops slowly and, as well as the grains of rib orientation, there arises the possibility of the growth of crystallites of different orientations. The latter is experimentally confirmed by the results of investigating the textural changes at the state of secondary recrystallization. (5 refs.)

68554 Basic conditions for the formation of perfect ribbed texture on secondary recrystallization in ferrosilicon. V.M.Segal, V.A.Gustomesov, M.B.Tsyrlin, A.M.Tseitlin (Ural Sci. Res. Inst. of Ferrous Metals, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.53-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.679-83 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
Four different combinations of cold rolling, recrystallization annealing, decarbonising annealing, high temperature annealing and other forms of heat treatment are used to obtain electrical engineering steel with a perfect ribbed texture. The results are discussed in terms of the structural prerequisites for secondary recrystallization. (9 refs.)

68555 Influence of elastic stress on the formation of cubic and axial $\{hk0\}\langle 001\rangle$ texture in 3% ferrosilicon. R.I.Malinina, N.N.Konev, M.V.Anisimova (Moscow Inst. of Steels & Alloys, Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.57-61 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.684-8 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The change in Gibbs energy of crystallites of different orientations in the field of residual elastic stress is estimated at room temperature and at 500°C in sheets of 3% ferrosilicon. It is shown that, in the elastic-stress field, the increase in Gibbs energy depends on the crystallite orientation. (11 refs.)

68556 Kinetics of grain growth. V.Yu.Novikov (Moscow Inst. of Steels & Alloys, Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.62-5 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.689-92 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The results of mathematical modeling of the process of grain growth in a nontextured material and a material with scattered texture are given. The kinetics of grain growth in the presence of a retarding or 'additional' (besides the decrease in total energy of the grain boundaries) motive force and also of growth in a sheet sample is described by equations differing from $\bar{D}^2$-$\bar{D}D_0{}^2=At$ (1) or $\bar{D}=kt^0$u.^{5} in the magnitude of the power index or in form. (14 refs.)

68557 Influence of small deformations on the stability of fine-grain structure in the alloy Fe-3% Si. B.K.Sokolov (Inst. of Metal Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.66-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.693-5 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
It is shown, for the engineering alloy Fe-3% Si, that small (subcritical) tensile deformations (about 1%) lead to hindering of the collective grain growth in conditions of slow heating with annealing. (15 refs.)

68558 Structure of very thin strips of electrical-engineering steel. V.P.Baryatinskii, V.V.Sosnin, M.Yu.Polyakov, V.V.Shitov, G.D.Belyaeva, A.V.Chebyshev, A.I.Medvedeva (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.71-3 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.698-700 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
The influence of a high content of inclusions (mainly of nitride type) in the unrolled sample on the formation of fine structure in a very thin tape of electrical-engineering steel is investigated. It is shwon that the bulk density of particles in the finished tape is larger by a factor of 1.5-2 than in the unrolled sample, as a result of the presence of a finely disperse component of size less than 500 Å. (5 refs.)

68559 A theory of non-linear anisotropic hardening. D.W.A.Rees (Engng. School, Trinity Coll., Dublin, Ireland).
Proc. Inst. Mech. Eng. Part C (GB), vol.197, p.31-41 (March 1983).
A yield function is derived which accounts for translation, contraction and rotation of the yield surface in the progress of plastic deformation for non-linear work-hardening materials. The present theory removes the restrictive condition of a rigid translation implicit in linear work-hardening by the kinematic hardening rule. The function proposed is shown to be in good agreement with experimentally determined yield loci for 2.25%Cr-1%Mo alloy steel at room temperature in a principal biaxial stress subspace and those for aluminium 1100 at room and elevated temperatures in a combined tension-torsion stress subspace. Parameters pertaining to translation are determined, in confirmation of the theory, from reversed yielding torsion tests on tubes of En 3B steel. (17 refs.)

68560 An X-ray diffraction study of lattice imperfection in cold-worked FCC alloys. IV. Copper-germanium (alpha-phase). S.K.Ghosh, M.De, S.P.Sen Gupta (Dept. of General Phys. & Indian Assoc. for the Cultivation of Sci., Calcutta, India).
J. Appl. Phys. (USA), vol.54, no.4, p.2073-8 (April 1983).
For pt.III see S.K. Halder and S.P. Sen Gupta, ibid., vol.48, p.5310 (1977). X-ray Fourier line profile analysis has been performed on four compositions of copper-germanium (FCC) alloys containing 3.05, 6.00, 9.25, and 10.00 at.% of solute germanium. The diffraction profiles from 111, 200, 220, 311, 222, and 400 reflections for both cold-worked and annealed samples in each case have been recorded in a counter diffractometer with Cu radiation using a LiF crystal monochromator. Detailed studies on recorded profiles, considering recent developments in the analyses (as in Papers I-III), for peak shift, peak asymmetry, and peak shapes have been made in order to evaluate the microstructural parameters characterizing the deformed states of the materials. Both the effects of lattice parameter change ($\Delta a/a_0$) and long-range residual stress σ are found to be negligible in causing the net peak shifts. Quantitative estimations of intrinsic (α'), extrinsic (α''), and twin (β) stacking fault probabilities have been made, and results have clearly shown the increased presence of intrinsic faults over the extrinsic ones and a complete absence of deformation twin faults in accordance with the previous observations (Papers I-III). The values of dislocation density ρ have been evaluated from anisotropic domain sizes and RMS microstrains. Considering the two expressions

for the stacking fault energy (Williamson and Smallman, 1956; Schramm and Reed, 1975), the stacking fault energy of pure Cu (γ_0) have also been estimated. (20 refs.)

68561 Development of residual stress in roll straightened tubes. Dong Nyung Lee (Coll. of Engng., Seoul Nat. Univ., Seoul, Korea), Young Hoon Chung, Myung-Chul Shin.
J. Korean Inst. Met., vol.20, no.12, p.1086-9 (Dec. 1982). In Korean.
In order to study development of residual stresses in tubes due to roll straightening, a transverse compression test has been made. Development of tensile residual stress in the outer layer and compressive stress in the inner layer of tube, and expansion of the tube diameter have been found to be inherent problems in the roll straightening. (3 refs.)

68562 The work-hardening behaviour of hydrogen-charged high purity iron single crystals at temperatures between 296 and 200K. A.Kimura, H.Matsui, H.Kimura (Tohoku Univ., Sendai, Japan).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.211-22 (April 1983).
Three-stage work hardening is observed when high purity iron single crystals of single-slip orientation are tested in tension during hydrogen charging between 296 and 200K. The effects of hydrogen on the deformation behaviour, i.e. The temperature and orientation dependence of the stress-strain curve the slip lines, the dislocation structures and the rotation of the specimen axis during deformation, were investigated. Hydrogen causes marked softening, and stage I′ proceeds with single slip by the motion of primary screw dislocations. After overshooting, stage II′ sets in with the long-range motion of secondary screw dislocations. The length of state I′ increases with the distance of the initial specimen orientation from the double-slip boundary and with decreasing temperature down to 225K. The results are discussed in terms of the variation in the difference between the mobilities of edge and screw dislocations due to the hydrogen. Hydrogen charging increases the uniform elongation of the crystal because it results in a long stage I′. The fracture is of a semibrittle nature in contrast with the complete ductility in specimens without hydrogen. (16 refs.)

68563 Work hardening and dynamical recovery in silicon and germanium at high temperatures and comparison with FCC metals. H.Siethoff (Phys. Inst., Univ. Wurzburg, Wurzburg, Germany), W.Schroter.
Scr. Metall. (USA), vol.17, no.3, p.393-8 (March 1983).
The work-hardening coefficient θ in the deformation stages III, IV, and V of the stress-strain curves of silicon and germanium was analysed. In stage III, θ decreases linearly with the shear stress; the linear extrapolation $\theta \rightarrow 0$ defines a maximum stress τ_{IIIm}, which shows the same temperature and strain-rate dependence as τ_{III}, the stress at the beginning of stage III. This indicates the same recovery mechanism (climb) to operate in the entire stage III. In stage V, the decrease of θ with stress is not linear. $\theta(\tau)$-curves, published in the literature for gold and aluminum, are rather similar to those found for silicon and germanium at comparable temperatures, thus indicating the hardening curves of these FCC metals also to consist of five deformation stages. In stage III of gold, a diffusion-controlled recovery mechanism seems to be rate controlling at high temperatures. (17 refs.)

68564 Effect of electric current pulses on the recrystallization of copper. H.Conrad, N.Karam, S.Mannan (Dept. of Materials Engng., North Carolina State Univ., Raleigh, NC, USA).
Scr. Metall. (USA), vol.17, no.3, p.411-16 (March 1983).
Presents the results obtained for the concurrent application of d.c. pulses during the isochronal annealing of cold-worked copper. The observed effects of the current pulses include: (a) a reduction in the temperature for the onset of recrystallization, (b) a reduction of the volume fraction of annealing twins and (c) an enhancement of the rate of grain growth. It is proposed that the higher mobility of dislocations produced by the electric current is in part responsible for these effects, either directly or indirectly. However, other electron-defect interactions and local (spike) heating effects may also be important. (25 refs.)

68565 The questionability of empirical work-hardening laws. L.Ratke, P.I.Welch (Inst. fur Metallkunde & Metallphys., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Z. Metallkd. (Germany), vol.74, no.4, p.226-32 (April 1983).
The differential *n*-value—i.e. the instantaneous slope of the logarithmic true stress true strain curve—was experimentally determined for five materials as a function of strain. A typical variation of the *n*-value was found for all five materials: an increase at small strains, a maximum, and a continuous decrease at higher strains up to maximum load. A comparison of the measurements with the predictions obtained from four classical work hardening theories (Hollomon, Ludwik, Swift/Krupskowski, Voce) showed that all these empirical descriptions of the stress-strain curve using constant parameters are unable to describe the work hardening behaviour of polycrystalline materials. The divergence of the measured results from those predicted are so large that these 'laws' are highly questionable and their use should be discontinued. It is technologically and physically necessary to measure the differential *n*-value (as it is described here) experimentally without the assumption of any particular strain hardening law. (56 refs.)

68566 Fine-grain creation in high-silicon electrical-engineering steel. A.M.Glezer, B.V.Molotilov, V.Z.Pogosov (I.P. Bardin Central Sci. Res. Inst. of Ferrous Metall., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.46, no.4, p.69-70 (1982). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.46, no.4, p.696-7 (1982). [received: May 1983] (Proceedings of the Sixth All-Union Conference on the Physics and Physical Metallurgy of Electromechanical Steels and Alloys, Asha, USSR, 15-17 Sept. 1981).
It is shown that increase in rate of crystallization, after vacuum smelting, modification with cerium, the elimination of forging and hot rolling as undesirable technological operations, and finally warm rolling under optimal conditions, allows the plasticity of high-silicon (6 wt.%) electrical-engineering steel to be increased in cold rolling. This result is based on the engineering steel to be increased in cold rolling. This result is based on the reduction in initial and effective grain size to 50 and 3-4 μm, respectively. (2 refs.)

68567 On the influence of impurity additions and quenching temperature on the course of the microhardness (HV) during a two-step ageing treatment of an Al-2.0 at.% Zn-1.3 at.% Mg alloy. R.Gerlach, H.Loffler (Sektion Math. Phys., Padagogische Hochschule Halle, Halle, Germany).
Cryst. Res. & Technol. (Germany), vol.18, no.3, p.367-74 (1983).
A pure as well as the analogous technical alloy were directly quenched from T_q=400°C or 490°C to T_a, preaged at T_a (ranging between 50°C and 160°C) various times (t_a), and subsequently postaged at RT up to t_{post}=42 d. Ageing the samples below the upper limit temperature of the homogeneous formation of GP zones (T_{hn}) no essential difference in the course of the HV-number attained after one- as well as two-step ageing in dependence on the addition of impurity atoms and T_q could be found. Contrary to this behaviour after pre-ageing at $T_a > T_{hn}$ and postageing at RT a variation of both T_q and the content of impurity atoms shows a considerable effect. The reason is the difference in the density of nucleation sites for heterogeneous formation of precipitates of the η'-and/or η-phase in dependence of T_q and impurity content. (12 refs.)

68568 Properties of polycrystalline indium oxide in the air and in vacuum. A.E.Solov'eva, V.A.Zhdanov, V.L.Markov, R.R.Shvangiradze.
Inorg. Mater. (USA), vol.18, no.5, p.693-6 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.825-8 (May 1982). [received: Feb. 1983]
The properties of polycrystalline indium oxide were studied relative to the annealing temperature in air and in vacuum. Indium oxide begins to change its chemical composition upon annealing in the air at 1200°C and at 800°C in vacuum. Upon annealing of the samples in air from 1200° to 1450°C, the indium lattice apparently loses only oxygen. This process is accompanied by a change in the sample color, electrophysical properties, unit cell parameter, and density. The cationic sublattice begins to break down in vacuum starting at 900°C. This process is accompanied by destruction of the color centers. The X-ray phase analysis data and deviation from stoichiometry of indium oxide relative to the annealing temperature in air were used to calculate the radiographic density and activation energy for reduction taking account of formation of the color centers. (7 refs.)

68569 Hot rolling of Sendust. S.Watanabe, T.Sato, S.Hanada (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.329-35 (April 1983). In Japanese.
Deformability by hot rolling of Sendust with the nominal composition of 9.6% silicon, 5.4% aluminum and balance iron has been investigated as a function of hot rolling temperature and reduction per pass. It was found that under the optimum rolling conditions. Sendust became ductile and was hot rolled without grain boundary cracking or cleavage cracking. The optimum rolling conditions are consistently derived from conditions of ductile deformation in tensile or bending tests at the lower strain rate region. (13 refs.)

68570 Effect of composition on deformability by hot rolling of Sendust and magnetic properties of hot rolled Sendust. S.Watanabe (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan), Z.Nakamura, S.Hanada, T.Sato, O.Izumi.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.351-8 (April 1983). In Japanese.
Deformability by hot rolling of Sendust and magnetic properties of hot rolled Sendust have been investigated as a function of composition. With increasing silicon content at a constant aluminum content, deformability decreases, while it is not changed by increasing aluminum content at a constant silicon content. These results are qualitatively explained on the basis of mechanical tests at lower strain rates. Magnetic properties are improved by hot rolling, and especially the initial permeability is raised in the low frequency range. Molding and μ_i-temperature characteristics of cast and hot rolled Sendust are quite sensitive to composition. Segregation of alloying elements introduced during solidification is removed by hot rolling. (8 refs.)

68571 The long term structural stability of the eutectic composites Cd-Zn and Pb-Cd. G.D.Delamore, R.W.Van De Merwe, D.P.Dunne, R.W.Smith (Dept. of Metall. Engng., Queen's Univ., Kingston, Canada).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.283-90
It is shown that marked microstructural coarsening can occur when eutectic composites are exposed for relatively short periods to temperatures approaching 0.9 T_m (where T_m is the eutectic melting temperature in K). Less well known and, perhaps, of more practical importance, are the microstructural changes and consequent changes in properties which result from prolonged exposure at 'safe' operating temperatures, e.g. 0.5 T_m. Cd-Zn and Pb-Cd eutectic specimens of various thermal histories were examined immediately on preparation and subsequently re-examined after storage at ambient laboratory temperatures for up to 1000 days. In general, microstructural changes from the as-grown and heat-treated conditions were observed. In some cases for the Pb-Cd alloy this consisted of only slight thickening of the already coarse lamellae terminations. However, in the more rapidly frozen, and therefore microstructurally finer, specimens marked discontinuous coarsening was observed, but confined to eutectic-cell-wall regions. There the coarse precipitates grew at many angles, including being perpendicular to the eutectic habit plane, but were not separated by any well-defined large angle grain boundaries. It was concluded that high temperature degradation occurs mainly by

continuous coarsening, whereas at low temperatures microstructural changes are effected mainly by discontinuous coarsening. (7 refs.)

68572 The high temperature degradation of Cd-Zn and Pb-Cd eutectic alloys. R.H.van de Merwe, R.W.Smith (Queen's Univ., Kingston, Canada).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.291-304
Various thermal treatments have been applied to Cd-Zn and Pb-Cd eutectic alloys in an attempt to better understand the thermal stability of eutectics close to their melting temperatures. Specimens of each system were grown at 40, 400 and 4000 mm/hr to obtain microstructures which were either lamellar, lamellar/cellular, or cellular. These specimens were thermally treated by either: (1) isothermal annealing at 0.95 Tm (up to 192 hrs), (2) thermal cycling between room temperature and 0.95 Tm (up to 64 cycles), (3) exposing to thermal gradients parallel to the growth direction and maintaining one end of the specimen at 0.95 Tm and the opposite end at room temperature (up to 48 hrs). It was found in all cases that some microstructural changes occurred but that the two alloy systems displayed marked differences in degradation sequence. An explanation and interpretation of these decay sequences is attempted. The mechanical properties of the variously treated alloy specimens were determined and are correlated with the observed microstructural features. The Cd-Zn specimens coarsened more rapidly than equivalent Pb-Cd specimens, as might be expected since the interphase boundary energies have been reported as 86 and 67 erg/cm^2 respectively. (31 refs.)

68573 The response of MnSb-Sb composites to isothermal aging. T.F.Marinis (Bell Telephone Labs., Allentown, PA, USA), R.F.Sekerka.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.315-27
A eutectic alloy of antimony and manganese was directionally solidified to produce a composite of cylindrical fibers of MnSb aligned in a Sb matrix. The fibers were about 3 microns in diameter by 1 millimeter long and occupied 30% of the composite volume. Isothermal aging caused the fibers to develop undulations that had an average wavelength of 1.74±0.45 times the fiber circumference. The Nichols' and Mullins' model of fiber spheroidization predicts an undulation wavelength of $\sqrt{2}$ times the fiber circumference, for interface diffusion control. The Coine model, for volume diffusion control, predicts a wavelength that approaches infinity for this fiber volume fraction. The authors' modeling efforts have shown that the predicted wavelength is quite sensitive to the assumed spatial correlation between nodes on adjacent fibers. They also found that the undulation growth rate achieves a broad maximum as a function of wavelength, which may account for the large standard deviation associated with our measurements. (5 refs.)

81.40J Elasticity and anelasticity

(see also 62.20D Elastic constants, 62.40 Anelasticity, internal friction, and mechanical resonances)

68574 Uniaxial stress relaxation and creep behaviour in weldments of the pressure vessel steel A533B between 600 and 640°C. R.Otterberg (Swedish Inst. for Metals Res., Stockholm, Sweden).
Res Mech. (GB), vol.7, no.2, p.67-77 (1983).
In order to predict the stress reduction during stress relief heat treatment in welded joints of the pressure vessel steel A533B, uniaxial stress relaxation as well as creep tests were performed. The specimens were isothermally stress-relaxed between 600 and 640°C from initial stresses corresponding to specimen elongations of 0.25, 0.5 and 2.0%. The stress relaxation results are excellently described by a Norton relationship. The magnitude of the initial stress was found to affect the stress relaxation at the beginning of the tests, but after one hour the effect was very small. Creep strain data from creep tests in the specified temperature range were converted to describe stress relaxation behaviour as well. The results are used in an accompanying study in order to predict the multiaxial stress reduction in thick weldments of A533B steel. (3 refs.)

68575 Temperature dependence of dynamic & static Young's modulus of polymers. B.R.Yadav (Dept. of Phys., Government Girls Coll., Bilaspur, India), A.G.Dongaunkar.
Indian J. Pure & Appl. Phys., vol.20, no.12, p.988-9 (Dec. 1982). [received: April 1983]
Values of dynamic Young's modulus (Y_d) (ibid., vol.19, p.29, 1982) of some polymers obtained by cantilever dynamical methods are found 5 to 30% higher than that of the static Young's modulus (Y_s) (O'Dwyer J.J., The theory of electrical conduction and breakdown in solid dielectrics (Clarendon Press, Oxford), 1973) below room temperature; above room temperature the values are reversed after a cross-over. A critical temperature at which both the moduli have the same value has been found to depend on the material used. In the temperature range 0-30°C, values of Y_d are found to decrease linearly with increase in temperature whereas values of Y_s are almost constant in this temperature range; thereafter both the values fall rapidly. As compared to Y_d, the value of Y_s obtained by an electrical method depends more on internal disorder and molecular chain length. (6 refs.)

68576 The mechanical moduli of lamellar semicrystalline polymers. R.H.Boyd (Dept. of Chem. Engng., Univ. of Utah, Salt Lake City, UT, USA).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.493-504 (April 1983).
Bounds on the elastic constants are derived for semicrystalline polymers whose local morphology is lamellar. Local response matrices (stiffness and compliance) are formulated in three dimensions that simultaneously incorporate uniform in-plane strain and additive forces from layer to layer of crystalline and amorphous phases and uniform stress and additive displacements normal to the lamellar surfaces. Spatial averaging of the stiffness and compliance matrices under the assumption of axially symmetric orientation gives the upper and lower bounds on the longitudinal and transverse tensile moduli and the axial and transverse shear moduli as functions of the separate phase elastic constants, the volume percent crystallinity, and the moments of the orientation $\langle\cos^2\theta\rangle$ and $\langle\cos^4\theta\rangle$. The bounds are much tighter than the Voight upper and Reuss lower bands that do not recognise phase geometry. (22 refs.)

68577 The influence of low-temperature crystallisation on the tensile elastic modulus of natural rubber. A.Stevenson (MRPRA, Hertford, England).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.553-72 (April 1983).
When natural rubber crystallises at low temperatures, there is an increase in elastic modulus of up to two orders of magnitude. This phenomenon has been studied at various temperatures in the range 0 to −55°C for samples held at tensile strains of up to 500%. There is an induction period associated with the nucleation of crystallites before any increase in modulus is observed. The induction period increases with decreasing strain and passes through a minimum with increasing temperature at −25°C. The growth rate subsequent to nucleation is successfully described in terms of Avrami rate coefficient is independent of temperature and follows a simple exponential function of strain. The equilibrium extent of the modulus increase has also been studied by means of experiments of up to three months' duration. The equilibrium modulus increases with decreasing temperature—as predicted by Flory's thermodynamic theory. (43 refs.)

68578 Ionomeric blends. II. Compatibility and dynamic mechanical properties of sulfonated , cis-1,4-polyisoprenes and styrene/4-vinylpyridine copolymer blends. Z.-L.Zhou, A.Eisenberg (Dept. of Chem., McGill Univ., Montreal, Quebec, Canada).
J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.4, p.595-603 (April 1983).
Dynamic mechanical and optical transparency methods were used to investigate the compatibility of a series of blends of sulfonated cis-1,4-polyisoprene and styrene/4-vinylpyridine copolymers. It was found that compatibilisation occurs at a degree of substitution less than 5%. It is suggested that proton transfer from the sulfonic acid group to vinyl pyridine, which results in the generation of specific anion-cation interactions is responsible for the compatibilisation, since the removal of ionic interactions through esterification destroys the compatibility. (26 refs.)

68579 Viscoelastic analysis of glass-to-glass sandwich seals. G.W.Scherer (Corning Glass Works, Corning, NY, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.443-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A viscoelastic analysis of thermal expansion mismatch stresses in glass-to-glass sandwich seals is made. A simple expression is obtained that accurately

predicts the dependence of the setting temperature on the stiffness ratio of the seal. (4 refs.)

68580 Physical aging of glasses. K.L.Ngai, I.Manning (US Naval Res. Lab., Washington, DC, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.607-10 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
A model is presented which gives a unified description of the dispersion of relaxation times in the viscoelastic functions and the aging of viscoelastic properties of glasses and amorphous metals and polymers. The authors' treatment leads to a relaxation modulus of the form $G(t)=G_o \exp[-(t/\tau_p)^{1-n}]$, with $\tau_p=[(1-n)e^{n\gamma}E^n{}_c\ \tau_o]^{1/1-n}$. In their model aging effects are dominated by an increase of n as aging proceeds, resulting in a non-uniform shift of the entire spectrum of relaxation times. The model is consistent with recent experimental results of Chai and McCrum (1980) which impose a stringent demand on any treatment of viscoelastic aging. The class of compliance functions corresponding to the above relaxation modulus are evaluated and discussed. (12 refs.)

68581 Properties of stresses in composites with ribbon-like inclusions. S.Matysiak, Z.Olesiak (Uniwersytet Warszawski, Inst. Mech., Warsaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.397-408 (1981). In Polish.
A composite with rigid, ribbon-like fibres has been considered. The formulae have been derived for stress and displacements in the matrix surrounding a fiber in the case of tensile forces. The dependence on Poissons' ratio has been discussed and given in diagrams. The expression for energy density completes the paper. (10 refs.)

68582 Study of internal friction at high temperatures of high purity polycrystals and single crystals of nickel. A.Riviere, J.Woirgard (Lab. de Mecanique et de Phys. des Materiaux, ENSMA, Poitiers, France).
Scr. Metall. (USA), vol.17, no.3, p.269-73 (March 1983). In French.
In general, peaks are observed at 370-500K, 757K and 1120K. The amplitudes of these peaks varies considerably with the annealing temperature. The similarity between the behaviour of both types of crystal indicates that the phenomenon is not caused by relaxation at grain boundaries. It is suggested that the first peak is due to the cold working involved, and that the remaining peaks are stable features. (17 refs.) *N.C.*

68583 Some distinctive features of amplitude-dependent internal friction. V.A.Chelnokov, N.L.Kuz'min (M.I. Kalinin Polytech. Inst., Leningrad, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.10, p.1796-7 (Oct. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.10, p.3166-8 (Oct. 1982). [received: April 1983]
It is of interest to investigate the influence of grain size on both types of amplitude dependence of internal friction, measured both when the amplitude of oscillations was increasing and when it was decreasing. The authors have measured the decrement of oscillations by the method of damped oscillations of a freely suspended specimen effecting transverse oscillations at 400 Hz. The measurements were performed on AV-1 (99.7%) aluminum. The grain size was altered by successive recrystallization anneals after small preliminary deformations. It was thus possible to study the internal friction in one specimen successively for several grain diameters and in this way the influence of possible scatter in the chemical composition on the results of the measurements was reduced. (8 refs.)

68584 Mechanical properties of Cu-based composites with in situ formed ultrafine filaments. J.Bevk, W.A.Sunder (Bell Labs., Murray Hill, NJ, USA), G.Dublon, D.E.Cohen.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.121-33
Elastic and plastic properties of in situ Cu-based composites with Nb, V, and Fe filaments are reviewed. The evidence is presented for a pronounced size dependence of both the ultimate tensile strength and the Young's moduli. In composites with the smallest filaments (d~500-200Å) and filament densities as high as $10^{10}/cm^2$ dislocation density reaches values of 10^{13} cm/cm^3. The yield stress of these samples increases dramatically over the predictions based on the 'rule of mixtures' and their ultimate tensile strength approaches the estimated theoretical strength of the material (~2.7 GPa). The observed decrease of Young's modulus as a function of inverse wire diameter in the as-drawn composites is attributed to lattice softening due to high density of extended lattice defects. Upon annealing, Young's modulus increases by as much as 100% and exceeds the maximum values calculated from bulk elastic constants. Possible mechanisms leading to modulus enhancement and to related changes in magnetic and superconducting behavior of in situ composites are discussed. (14 refs.)

(see also 62.20F Deformation and plasticity, 62.20H Creep)

68585 On some micromechanism of memory of metals in the case of nonstationary processes of deformation in the thermal activation range. A.Blinowski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.1, p.39-48 (1982).
An idealized model of transient dislocation motion in a stress field has been analyzed. This motion was produced by the generation of kink pairs and their migration along a dislocation line. Transient processes associated with violent changes of strain conditions in the material have been discussed and small deviations from the steady process have been analysed considering the elastic strain component for a given strain rate. (8 refs.)

68586 On a model for the study of redistribution of residual microstresses during complex loading of polycrystalline metals. W.Szczepinski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Mech. (Poland), vol.34, no.1, p.105-16 (1982).
A simple structural model of polycrystalline aggregate composed of two kinds of elements of different shape forming a regular structure is considered. Due to the stress concentration in the elastic state caused by special configuration, elements of one family begin to deform plastically at a certain level of loading, while elements of the other family remain elastic. This model allows the author to study the redistribution of microstresses during complex plastic deformation process. As an illustration, a process of complex cyclic loading is analyzed. (22 refs.)

68587 Stabilization of copper alloys by heat treatment. D.Arnaud (Centre Tech. des Industries de la Fonderie, Paris, France).
Fonderie - Fondeur d'Ajourd'hui (France), no.22, p.43-6 (Feb. 1983). In French.
Solidification and cooling stresses can be reduced or eliminated by heat treatment. Curves have been plotted which make it possible to evaluate the influence of annealing on the elimination of internal stresses in high-strength brasses, bronzes and aluminium-bronzes. (8 refs.)

68588 Alterations in the microstructure of 304 stainless steel produced by small strain deformation at ambient temperature. M.E.Kassner (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Res Mech. (GB), vol.7, no.2, p.79-84 (1983).
AISI 304 stainless steel specimens were deformed at ambient temperature and a low (10^{-3} s^{-1}) strain rate to strains less than 0.10. The microstructures of the specimens were then characterised under a transmission electron microscope. The results suggest that 304 stainless steel deformed within this regime possesses microstructures different from those widely reported. It appears that any ambient temperature deformation introduces microtwins within at least some grains. (13 refs.)

68589 Superplasticity: a review of data. J.Gittus (UKAEA, Harwell, England).
Res Mech. (GB), vol.7, no.3, p.127-201 (1983).
A review is presented of experimental information on superplasticity in metals and alloys. These materials fall into two main categories: those in which a fine grain-size is stabilised during deformation by grain boundary precipitates and those in which a sizeable fraction of the specimen comprises particles of a second phase. In either case it is the existence of a fine grain-size that permits superplastic deformation to occur. The process is one in which the grains flow like grains of sand. Each grain accomplishes small, fluctuating changes of shape in order to prevent the opening-up of grain boundary cavities as deformation proceeds. It seems likely that most crystalline solids could be made to exhibit superplasticity providing that the requisite structure can be produced and retained during deformation. (139 refs.)

68590 Necking and deformation behavior of locally annealed aluminum sheets in simple tension. K.Manabe, H.Nishimura (Tokyo Metropolitan Univ., Tokyo, Japan).
Bull. JSME (Japan), vol.26, no.212, p.194-201 (Feb. 1983).
Low ductility metals are known to have ductility improved by composing with high ductility metals in layers, for example, cladding metals. The purpose of this investigation is to clarify the formation of mechanism of ductility enhancement in such metals. Simple tension tests are performed on aluminum sheets which are locally annealed by using a high frequency induction heating device and have hardness distribution in width direction. A geometrical model for the necking pattern is proposed, and the effects of annealed width on limit elongation and on the angle, pitch and pattern of necking are discussed in detail. Comparisons are made between the center and the edge annealed sheets. It is clearly demonstrated that the limit elongation and the ultimate strengh of such composite metals can be assessed by applying Swift's instability criterion (maximum load condition) to the total load. (6 refs.)

68591 Effect of the type of pre-torsional deformation on the creep rate of a silver-copper alloy. G.A.Hassan (Metal Phys. Lab., Nat. Res. Centre, Dokki, Egypt), H.H.Hassan.
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.144-5 (April 1983).
In the course of a previous study (G.A. Hassan, 1979) on the effect of bidirectional torsion on the creep rate, it was noted that the creep rate of polycrystalline aluminium wires showed significant sensitivity to the type and degree of pre-deformation. In the present work the study is extended to silver-0.3 wt.% copper wires which are pre-torsionally deformed. Room temperature creep curves for pre-twisted samples are compared with those for annealed (undeformed) ones. It is found that the type and angle of pretorsional deformation affected the creep rate of the alloy samples under investigation. (5 refs.)

68592 The effect of molybdenum in Type 316 stainless steel on grain boundary self-diffusion and creep rate at low stresses. H.Jones (Dept. of Metall., Univ. of Sheffield, Sheffield, England).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.146-8 (April 1983).
The strain rate per unit stress S sustainable in creep is $S=A[D_GS/kT][\Omega/L^3]$ where A is a numerical factor, D_GS is the product of grain boundary self-diffusion coefficient D_G and grain boundary width S, Ω is atomic volume, L is grain diameter, k is Boltzmann's constant and T is temperature in K. Observed S for Type 316 steel was a factor of 4 to 6 out on predictions of this equation. The possibility that the presence of Mo in this steel could be affecting D_GS was examined. (23 refs.)

68593 Low thermal contraction GFRP. K.Kadotani, F.Aki (Hitachi Res. Lab., Hitachi Ltd., Ibaraki, Japan).
Cryogenics (GB), vol.23, no.5, p.267-70 (May 1983).
Glass fibre reinforced plastics (GFRP) with low thermal contraction and high compressive strength are reported. The linear thermal contraction from 300K to 77K in the direction normal to the plane of the laminations is the same as that of the superconductor. Ultimate compressive strength at 300K is more than 800 MPa. These high-density voidless GFRP are suitable for spacers in large superconducting coils. (2 refs.)

68594 Variability in mechanical performance of G-10CR cryogenic-grade insulating laminates. M.B.Kasen, R.E.Schramm (Fracture & Deformation Div., NBS, Boulder, CO, USA).
Cryogenics (GB), vol.23, no.5, p.279-80 (May 1983).
An assessment is made of the variability in cryogenic mechanical performance of insulating laminates produced by five manufacturers to a common component and procedure specification. Results at 295K and 76K indicate that the specification is adequate to ensure the desired degree of product uniformity. (2 refs.)

68595 Effect of ion implantation on creep of molybdenum. I.W.Hall (Dept. of Mech. & Aerospace Engng., Univ. of Delaware, Newark, DE, USA).
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.27-31 (March 1983).
Thin sheet specimens of molybdenum have been ion implanted and subjected to creep testing. The results indicate that the effect of ion implantation is very dependent upon the ion type and the subsequent conditions of testing. Heavy-ion implantation can cause accelerated creep whereas implantation with carbon ions can cause a pronounced decrease in creep rate within the range of experimental conditions investigated. The results are considered in terms of the radiation damage arising from the implantation process and the microstructures observed by transmission electron microscopy. (7 refs.)

68596 Microplasticity and strength of Mn-Zn ferrites. A.M.Savel'ev, A.P.Korolev, V.P.Shelokhvostov, S.P.Travkin (Tambov Chem.-Engng. Inst., Tambov, USSR).
Ind. Lab. (USA), vol.48, no.7, p.726-30 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.79-81 (July 1982). [received: March 1983]
Methods of static bending and microhardness were used to investigate the features of microplastic deformation and its time relationship for polycrystalline Mn-Zn ferrite. Also investigated was the influence of residual elastic stresses on the microstrength. (4 refs.)

68597 Temperature dependence of $\{11\bar{2}2\}\langle\bar{1}\bar{1}23\rangle$ slip in zinc. H.Tonda (Dept. of Metall., Kumamoto Univ., Kumamoto, Japan), T.Kawasaki.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.284-93 (April 1983). In Japanese.
The tensile deformation behavior of zinc thin sheet crystals was investigated in the temperature range from 207 to 333K. The tensile axis of specimens is parallel to $\langle 11\bar{2}0\rangle$, and the surface is parallel to $\{0001\}$ (A specimens) or $\{10\bar{1}0\}$ (B specimens). B specimens showed such anomalous dependence that the yield stress increased from 11 to 13 MPa with increasing temperature, in contrast with the yield stress of A specimens decreasing from 13 to 9 MPa. The length of slip bands which appeared just after yielding decreased from 3 to 0.3 mm, and the mean free path of edge dislocations evaluated by the etch pit technique decreased from 300 to 10 μm with increasing temperature. The stress-strain curves of both A and B specimens exhibited stage I having the small work hardening ratio and then stage II having the large ratio. Stage II began just after the bundle of slip bands widening with strain, filled up the whole of specimen. With increasing temperature, the strain of stage I decreased and the work hardening ratio at stage II increased rapidly. (17 refs.)

68598 Deformation in 30% cold-rolled Cu-30Zn brass grains. D.K.Paik (Coll. of Engng., Ajoo Univ., Suwon, Korea).
J. Korean Inst. Met., vol.20, no.12, p.1079-85 (Dec. 1982). In Korean.
From slip traces produced by microhardness indentation, orientation of grains in a commercial Cu-30Zn brass has been determined before and after rolling reduction of 30% at room temperature. Different deformation structures were observed on grains, where the Schmid factor analysis shows that they depend on the number of active slip systems at rolling. When the primary slip system is unique, deformation is homogeneous, but when more than one slip system are equally active, deformation is heterogeneous; in particular, large, distinct subgrains can be formed. It was also observed that when a twin axis is parallel to the transverse direction regions contiguous to the twin boundary rotate together, thus remaining a narrow band of twin couple after rolling. From these observations, it was concluded that slip mechanism, during the first stage of cold-rolling, may include (1) multi-directional rotations on the same grain and (2) a binding force of the twin boundary on contiguous regions. (7 refs.)

68599 On the adiabatic shear of Ti-6Al-4V ballistic targets. Y.Me-Bar, D.Shechtman (Dept. of Materials Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.181-8 (April 1983).
Ballistic targets made of Ti-6Al-4V, which had undergone various heat treatments, were impacted by 7.62 mm armour piercing bullets, thus being subjected to strain rates of about 3×10^{5} s^{-1}. The adiabatic shear bands formed thereby were examined using optical and transmission electron microscopy. The high temperatures generated at the shear band can cause transformation from the α phase to the β phase and may lead to melting in some cases. The rapid cooling of the highly deformed shear bands was of the order of 10^{7}°C s^{-1}. This extremely high rate produced a very fine transformed structure. Bands that melted on heating differed from those whose temperature rose only to the β region. In the former all previous features have disappeared; in the latter the primary β lamellae were preserved and they served to indicate the direction and extent of the shear at any point within the band. In both cases the transformation products are harder than the base material. (7 refs.)

68600 Strain-temperature correlations obtained in rolling. A.P.Singh, S.Venkadesan, K.A.Padmanabhan (Dept. of Metall., Indian Inst. of Technol., Madras, India).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.223-7 (April 1983).
The conclusion of an earlier study (Singh and Padmanabhan, ibid., vol.51, p.137, 1981) involving upsetting, the fact that the strain ϵ_{st} necessary for obtaining a given grain size at any temperature decreased exponentially with the absolute temperature of deformation, was verified also for rolling using a low alloy steel and electrical grade aluminium. It was found that, in order to achieve good correlation between the upsetting and rolling results, the rolls had to be preheated by 100K and the heating temperature for rolling should be maintained at 50K above the corresponding temperature for upsetting. (18 refs.)

68601 Substructure and back stress changes resulting from the cyclic loading of $2^{1}/_{4}$Cr-1Mo steel at 755K. K.D.Challenger, P.G.Vining (Naval Postgraduate School, Monterey, CA, USA).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.257-67 (April 1983).
The effect of cyclic loading wave shapes on the cyclic stress-strain behavior and the dislocation-precipitate substructure has been studied for 2.25Cr-1Mo steel tested at 755K. Asymmetric loading (constant-strain dwell periods at only one strain limit) creates a higher dislocation density than does symmetric loading (continuous cycling or constant-strain dwell periods at both strain limits). The dislocations are tangled around M_2C particles for the asymmetric loading and more uniformly dispersed for the symmetric loading. The loading wave shape is shown to have a more significant effect on the dislocation density than does the plastic strain range. The carbides present in the alloy are very stable as no change are observed after up to 2000 h of cyclic loading at 755K. The back stress, as measured from hysteresis loops, was found to decrease during constant-strain hold periods, resulting in a reduction in the Bauschinger effect following a dwell period. The results are explained by a difference in the effective strength of dislocation barriers when asymmetric loading is employed. (20 refs.)

68602 Influence of temperature and stretching rate on the strength of polyester fibres of small elongation. A.Wrochowicz, M.Linek (Inst. Wlokienniczy, Filia Politech. Lodzkiej, Bielsko-Biala, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.239-52 (1981). In Polish.
The modification of the Zurkov equation (1961, 1962) widening the range of its application for materials characterized by strong flow during stretching is described. For such materials the structural coefficient γ is stretching rate and temperature-dependent. This results in loss of material strength with rise in stretching rate, when the stretching rate reaches a high value, and the temperature dependence is considerably greater than assumed by Zurkov. Moreover, the effect of intermolecular bounds on stress transfer in material, responsible for linear loss in the activation energy of destruction with increase in temperature, has been taken into account. The analyses of the Zurkov equation have been confirmed from data of measurements carried out on polyester fibres of small elongation. (25 refs.)

68603 On dilatation and plastic flow in metallic glasses. P.E.Donovan, W.M.Stobbs (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England).
Philos. Mag. A (GB), vol.47, no.4, p.537-46 (April 1983).
A modification of the free-volume theories of plastic flow in metallic glasses is considered which takes into account hydrostatic stresses. It is shown that this provides a qualitative explanation of many aspects of the observed behaviour of these materials. (34 refs.)

68604 The influence of trace additions of zirconium on diffusional creep in Ni-20% Cr. J.H.Schneibel, G.F.Petersen (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Scr. Metall. (USA), vol.17, no.3, p.353-8 (March 1983).
The diffusional creep properties of Ni-20% Cr and Ni-20% Cr-0.11% Zr were investigated both in the Coble creep and the Nabarro-Herring creep regime. Whereas zirconium has little, if any, influence on bulk diffusion in Ni-20% Cr it slows down the grain boundary diffusivity by approximately a factor of 10. The pronounced effect of zirconium may be caused by strong segregation at the grain boundaries. Both the solid solubility of zirconium in Ni-20% Cr and the zirconium-induced grain boundary diffusivity change suggest that approximately half a monatomic layer of zirconium could be segregated at the grain boundaries. (18 refs.)

68605 Bauschinger effect in a dual-phase steel. A.Goel, R.K.Ray, G.S.Murty (Dept. of Metall. Engng., Indian Inst. of Technol., Kanpur, India).
Scr. Metall. (USA), vol.17, no.3, p.375-80 (March 1983).
A dual-phase steel containing 1.5%Mn, 1.5%Si and 0.09%V was investigated in order to measure quantitatively the Bauschinger effect as a function of volume fraction of martensite and the tensile prestrain. It was found that the Bauschinger effect increases with increasing martensite volume content of about 20%, beyond which it decreases. Both the long-range back-stress and Bauschinger strain increases with increase in the tensile prestrain. Long-range back-stresses exerted by the dislocations around the martensite islands are probably responsible for the Bauschinger effect in this alloy. (2 refs.)

68606 Shape memory effect in the vanadium-hydrogen system. L.S.Bushnev, L.P.Kitaeva (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.713-16 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.38-43 (Aug. 1982). [received: April 1983]
The shape memory effect (SME) has been investigated in alloys of the V-H system at concentrations in the range 0.2-0.5 H/V. It is shown that SME occurs over the entire H/V range indicated, but the magnitude of the stresses, the reversibility of the deformation during heating, as well as the magnitude of the thermal hysteresis depend essentially on the hydrogen concentration. The conclusion is drawn that the transformation in this system is of a martensitic character. (9 refs.)

68607 Concentrational and temperature dependence of the physical yield point of FCC polycrystals of copper solid solutions. E.F.Dudarev, L.A.Kornienko (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).
Sov. Phys. J. (USA), vol.25, no.8, p.741-5 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.69-74 (Aug. 1982). [received: April 1983]
Although the nature of the yield point of FCC polycrystals of substitutional solid solutions is a question that has been under discussion for a long time, until recently there was no single view regarding the structural factors that determine its concentrational and temperature dependence. This is mainly because, in constructing theories of the yield point of polycrystals and analyzing experimental data, no account was taken of the specific features of the development of plastic deformation at the yield point and with stresses below the yield point, i.e. in the region of microplastic deformation. The present work is a continuation of earlier investigations on the principles underlying the mechanism of microplastic deformation of FCC polycrystals of substitutional solid solutions. (12 refs.)

68608 Consideration of anisotropy parameters in polycrystalline metals. P.I.Welch, L.Ratke, H.-J.Bunge (Inst. fur Metallkunde & Metallphys., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Z. Metallkd. (Germany), vol.74, no.4, p.233-7 (April 1983).
The concept of the strain ratio is discussed both theoretically and experimentally. It is found that the *r*-value as defined in various Standards is unsuitable both as an integral measure of plastic anisotropy over a range of strain and as a strain dependent variable. As a measure of the instantaneous anisotropy the parameter *p* is found to be theoretically sound and practically measurable. As an integral measure of plastic anisotropy over a desired strain range, as required in formability analysis, the integral of *p*, *P*, is found most suitable. The slop of a linear fit to the width strain/thickness strain data is found to give an accurate approximation to *P* if the fit is carried out over the same strain range. This quantity is easier to measure. Experimental results are presented which demonstrate the theoretical conclusions reached. (16 refs.)

68609 Transverse mechanical behavior of high-strength monocarbide eutectics. M.F.X.Gigliotti,Jr., M.R.Jackson, S.W.Yang, M.F.Henry, D.A.Woodford (Corp. Res. & Dev., General Electric Co., Schenectady, NY, USA).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.21-9
Superalloy eutectics strengthened with monocarbide whiskers are highly anisotropic in strength. Mechanical behavior transverse to the growth axis is governed largely by the fracture resistance of the matrix grain boundaries. While the matrices of these eutectics are essentially columnar grained superalloys, there are significant differences between DS superalloys and superalloy-monocarbide eutectics. These differences arise, in part from different soli-

dification processes and from the alloying limitations in eutectic systems. A study is made of transverse mechanical strengths of a series of monocarbide reinforced eutectic superalloys whose alloy matrix compositions range from high to low gamma prime content, and have intentional minor element additions of Hf, La, and B. (no refs.)

68610 The quaternary system Fe-Cr-Mn-C and aligned ferrous superalloys. F.D.Lemkey, E.R.Thompson (United Technologies Res. Center, East Hartford, CT, USA), J.C.Schuster, H.Nowotny.
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.31-50
The constitution of the quaternary, Fe-Cr-Mn-C, and to a lesser extent the quinary, Fe-Cr-Mn-Al-C, systems were examined for in situ composite alloy candidates. Multivariant eutectic compositions, determined from phase equilibria, were directionally solidified to produce aligned composites consisting of M_7C_3 carbides with a gamma iron matrix. The composition and lattice parameters of the carbide and matrix phases were determined to establish their respective stabilities. Stress rupture tests in the direction of phase alignment for certain compositions (e.g., Fe-20 wt.% Cr-10 wt.% Mn-3.2 wt.% C) indicated strength values comparable to cast nickel-base superalloys and exceeded those of the strongest iron-nickel superalloys developed for automotive turbines. Results of cyclic sulfidation testing at 900° indicated a balance of Cr and Al content to be important to the achievement of outstanding surface stability. (51 refs.)

68611 Off-axis tensile properties of γ/γ'-αMo DS eutectic. Z.Q.Hu, J.H.Zhang, Y.B.Xu, Z.Y.Zhang, Y.S.Zhang, Y.J.Tang (Inst. of Metal Res., Chinese Acad. of Sci., Liaoning, China).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.51-8
Reports a study of off-axis tensile properties of γ/γ'-αMo DS eutectic and the dynamic fracture process directly observed with a scanning electron microscope. If the loading direction deviates from the Mo fiber growth direction, the tensile strength and ductility decrease gradually. During the loading process, two types of cracking are observed: one is cracking of the fiber, and the other is delamination along the fiber-matrix interface. In plastic deformation, slip can pass through both the matrix and the fiber. As a rule, the thicker fibers are cracked earlier than the thinner ones, because they have less defects and better ductility. Delamination is the main source of final fracture. (7 refs.)

68612 Tensile creep and relaxation of the lamellar Al-Al_2Cu composite. Experiments on the tensile stage of a high voltage transmission electron microscope (HV TEM). M.Ignat, D.Caillard (Domaine Univ., Saint Martin d'Heres, France).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.115-19
Because of the lamellar microstructure, and also because of its defects, the local stresses are quite different from those of a normal tensile test. They are imposed by accommodation requirements at the various interfaces. The macroscopic deformation of a sample is a result of several deformation zones which depend on the distribution of lamellar defects. During plastic deformation, several mechanisms act simultaneously and their activation depends principally on temperature. During the tests performed in the high voltage electron microscope, the same type of mechanisms is observed in creep and in stress-relaxation tests. Nevertheless comparing these test substructures to the macroscopic test substructures, it is observed that in thin foils obtained from the macroscopic tests the dislocation substructure was denser for the stress-relaxation tests. This is in agreement with the fact that at constant temperature, the initial relaxation stress was always higher than creep stress, consequently the fixed initial strain was greater. (12 refs.)

68613 A correlation law for steady state creep and stress relaxation tests on the Al-Al_2Cu composite. M.Ignat, R.Bonnet, F.Durand (Domaine Univ., St. Martin d'Heres, France).
In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.135-41
Deformation by creep or by stress-relaxation involves similar thermally activated phenomena. In particular microstructural observations on the Al-Al_2Cu lamellar composite illustrated the importance of the interphase accommodation mechanisms, especially movements of linear defects at the phase boundaries. Experimental results have shown that the asymptotic stress measured in stress-relaxation tests takes the same value as the threshold stress limiting the steady state creep domain. From this finding a simple Bingham rheological model was developed in which a temperature dependent threshold stress is combined with a generalized Dorn viscosity law. The model correlates satisfactorily the results of both steady state creep tests and the results of stress-relaxation tests. The calculated activation energy and stress exponent are compared with the values deduced from physical models of deformation accommodation through grain boundary sliding. (18 refs.)

81.40N Fatigue, embrittlement, and fracture

(inc. hardness; see also 62.20M Fatigue, brittleness, fracture and cracks)

68614 Observations of cyclic grain boundaries migration in aluminium after large numbers of fatigue cycles. V.Raman, T.G.Langdon (Dept. of Materials Sci. & Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.180-2 (April 1983).
Polycrystalline aluminium is found to exhibit a one-to-one correspondence between grain boundary migration markings and the number of fatigue cycles for up to at least 150 cycles. The occurrence of migration introduced the possibility of grain growth if small grains disappear in the migration process. By using interferometry, it is shown that grain boundary sliding occurs during each cycle of migration. (11 refs.)

68615 Non-conventional tungsten-base hard metal. H.Sheinberg (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.17-26 (March 1983).
A novel hard metal composition comprising borides and carbides of tungsten, nickel, and iron is made by reaction hot pressing mixtures of elemental tungsten, nickel, and iron powders with small quantities of boron carbide. The hardness of these compositions is in the range of the hardest conventional tungsten carbide-cobalt compositions. It was subsequently determined that molybdenum can be substituted for all the tungsten in the composition, and elemental boron can be substituted for the boron carbide with a minimum reduction in hardness. The new composition can be used in high-pressure anvils; it sustains higher pressures than commercial carbides without plastic deformation. (2 refs.)

68616 Fracture toughness of hardened cement paste and concrete. I.A.Pathan (Mehran Univ. of Engng. & Technol., Jamshoro, Pakistan).
Mehran Univ. Res. J. Eng. & Technol. (Pakistan), vol.1, no.4, p.7-13 (Oct. 1982). [received: April 1983]
The single edge cracked specimens of hardened cement paste and concrete were tested to failure in direct tension. The fracture toughness was calculated by using equations of linear elastic fracture mechanics. The results indicate that the fracture toughness of hardened cement paste is constant for various depths of the induced crack and is a material property; while the fracture toughness of concrete increases with the increasing depth of the induced crack up to some critical value. (15 refs.)

68617 Assessment of the susceptibility to hydrogen embrittlement with an original specimen. I. Effect of heat treatment on delayed failure time of 38 NiCrMo 4 steel. R.Fratesi, G.Roventi, F.Veniali (Dipartimento di Sci. dei Materiali e della Terra, Univ. di Ancona, Ancona, Italy).
Mater. Chem. & Phys. (Switzerland), vol.8, no.2, p.179-87 (Feb. 1983).
Delayed failure tests, in which suitable samples were cathodically charged with hydrogen (current density 8 $mA.cm^{-2}$) in 0.1 N sulphuric acid, while under sustained tensile loads, were conducted upon a low alloy Ni-Cr steel (UNI 38 NiCrMo 4) with different conditions of heat treatment. The satisfactory reproducibility of the experimental results have indicated the suitability both of the method used and the test specimen shaped to prevent stress concentration and mechanical and/or electrochemical cracking. (12 refs.)

68618 Influence of an overload on the fatigue crack growth in steels. C.Robin, M.Louah, G.Pluvinage (Lab. de Fiabilite Mecanique, Faculte des Sci., Metz, France).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.1-13 (1983).
Concerns the influence of a single-peak overload and the overload ratio on the subsequent rate of growth of a fatigue crack in steels. Retardation increases with increasing overload ratio. The crack opening load was also measured during all tests. It is shown that the Elber's crack closure concept is not able to explain the effect of overloads. The importance of the material yield stress was evaluated by testing steels of different strength. It seems that the residual stress state induced by the overload is the major factor causing retardation. Two models are analyzed. (17 refs.)

68619 The effect of environment on the growth of small fatigue cracks. J.Lankford (Southwest Res. Inst., San Antonio, TX, USA).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.15-31 (1983).
The growth of 'large' and 'small' cracks in 7075-T6 aluminum is characterized in moist air and dry nitrogen. It is found that in both environments, the small cracks grow faster than large ones, but unlike large cracks, which grow much faster in air than in nitrogen, the small cracks extend in each environment at about the same average rate. The absence of environmental effect is found to be only apparent, a change to an inherently slower mode of growth in air offsetting the crack-accelerating influence of moisture. Subsurface grain boundaries apparently retard microcrack growth in both environments. Possible rationales for the rapid growth of small cracks are discussed. (19 refs.)

68620 On the relation between stable crack growth and fatigue. S.Kaiser (Dept. of Strength of Materials & Solid Mech., Royal Inst. of Technol., Stockholm, Sweden).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.33-49 (1983).
Fatigue crack growth in the intermediate range can be described by the Paris law of linear elastic fracture mechanics. However, if gross plastic deformation is involved, the crack growth rate is often underestimated by LEFM. The increased crack growth rate due to plastic deformation was determined by using the *J-R* curve. This model was found to give very good results over a wide range of high crack growth rates for three different geometries of two different steels. A way to predict instability under controlled cyclic load is discussed and is proved to work well in practice. Instability under displacement control is also discussed. (9 refs.)

68621 Slow fatigue crack growth and threshold behaviour in IMI 685. M.A.Hicks, R.H.Jeal (Materials Engng. Group, Rolls-Royce Ltd., Derby, England), C.J.Beevers.
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.51-65 (1983).
Fatigue thresholds and crack growth rates up to 10^{-4} mm cycle^{-1} have been measured in β processed IMI 685. The results obtained in laboratory air for material having an aligned α microstructure and a random basketweave microstructure displayed a pronounced load ratio dependence which increased with decreasing ΔK. This sensitivity to mean load was also apparent from the threshold results determined in a vacuum of 5×10^{-6} torr. Fractographic observations, compliance measurements, pd output and crack path replication have indicated that contacts can be made between the fracture faces at a number of points behind the crack tip during the load cycle. These contacts wedge the crack open, thus preventing the stress intensity from falling to the value associated with the minimum applied load. A critical stress intensity, K_{op}, has been determined which relates to the crack being fully 'open' and the results are reanalysed and discussed in terms of an effective stress intensity range, ΔK_{eff}. (29 refs.)

68622 A study of short fatigue crack growth behaviour in titanium alloy IMI 685. C.W.Brown, M.A.Hicks (Materials Engng. Group, Rolls Royce Ltd., Derby, England).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.67-76 (1983).
The fatigue growth of short cracks in coarse grained IMI 685, having an aligned α microstructure, has been monitored using a two stage replication technique. Crack growth rates are presented in terms of the failure mechanism and compared with standard data obtained from through cracked, compact tension specimens. The maximum difference, of up to four orders of magnitude, between long and short crack growth rates is associated with separation along specific crystallographic planes resulting in a cleavage-like fracture appearance. The rate of short crack growth is also shown to be dependent on applied stress and a dwell at maximum load during the fatigue cycle. (25 refs.)

68623 On life time predictions with the strain range partitioning method. W.Hoffelner, K.N.Melton, C.Wuthrich (Brown, Boveri & Co. Ltd., Baden, Switzerland).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.1, p.77-87 (1983).
Computer optimization techniques were applied to the strain range partitioning method for life time prediction under high temperature low cycle fatigue loading. The experimental data were evaluated using a simultaneous parameter fit determination of the baseline coefficients. This approach gave good predictions whereas a more conventional method did not work. The significance of the linear damage rule and the interaction damage rule is discussed on the basis of a generalised rule containing both as special cases. This formalism was applied to a ferritic steel and a cast nickel base-superalloy. In both cases a very good agreement between calculated and measured lifetimes was found. (13 refs.)

68624 The selection of crack path on fatigue crack propagation in dual phase steels. T.Ishihara (Aero-Engine & Space Operations, Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo, Japan).
Int. J. Fract. (Netherlands), vol.22, no.1, p.R31-2 (May 1983).
A study has been made on selection of crack path on fatigue crack propagation in dual phase microstructures in which the martensitic phase encapsulated islands of ferritic phase are in association with the cleavage cracking of ferrite (grains). (3 refs.)

68625 Hydrogen embrittlement of yttrium. C.V.Owen, T.E.Scott (USDOE, Iowa State Univ., Ames, IA, USA).
J. Less-Common Met. (Switzerland), vol.90, no.2, p.275-82 (April 1983).
The mechanical properties of yttrium containing 0.23, 5.03, 11.7 and 16.3 at.% H were investigated from 78 to 473K. Hydrogen caused strengthening at temperatures below about 295K. Furthermore, anomalous behavior of both the strain-hardening exponent and the strain rate sensitivity parameter occurred at this temperature when hydrogen was added to yttrium. Sharp ductile-to-brittle transitions were observed in the material containing 11.7 and 16.3 at.% H. Supporting evidence and experimental results are presented which show that hydrogen in solution can embrittle yttrium. (20 refs.)

68626 Intergranular fracture of high purity iron due to oxygen. H.Matsui, H.Kimura (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.294-300 (April 1983). In Japanese.
A high purity iron, prepared in the form of smooth wire, does not show IGF in a tensile test at 4.2K. Polycrystalline specimens of this iron was doped with oxygen; a thin oxide film was formed on the surface and a concentration (<several mass ppm) of oxygen was dissolved in equilibrium with the oxide. Thereafter, the oxide film was removed and a tensile test was performed between 4.2 and 20K. As the oxygen concentration is increased by increasing the doping temperature (873, 973 and 1073K), the elongation to fracture at 4.2K decreased. Specimens, which are doped with oxygen at 973 and 1073K and fracture at 4.2K along grain boundaries without any appreciable elongation, are completely ductile at 20K. If well-decarburized and not doped with oxygen, a commercial high purity iron (the Johnson-Matthey iron) is more susceptible to IGF than high purity iron. The results show that oxygen segregated at grain boundries weakens the grain boundary cohesion of iron to some extent, but that the effect is not so large as considered before. (25 refs.)

68627 Brittleness of Sendust. S.Hanada, S.Watanabe, T.Sato, S.Ono, O.Izumi (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.336-42 (April 1983). In Japanese.
The brittleness of Sendust with the nominal composition of 9.6% silicon, 5.4% aluminum and the balance of iron has been studied experimentally. By high thermal stress due to temperature gradient in the crystal, cleavage cracks along {001} plane or grain boundary cracks are easily introduced during either solidification after casting or subsequent heat treatments. The {001} cleavage cracks are also formed under applied external stress. Fracture stress of hot rolled Sendust examined by bending tests is higher than that of cast one, indicating the removal of internal defects by hot rolling. The single crystal which was prepared by zone-melting, and therefore, less-stressed thermally can be bent plastically even at room temperature, showing a lack of internal defects acting as the origin of cracking. (5 refs.)

68628 The influences of heat-treatment and cold-work on the low temperature hydrogen embrittlement of austenitic stainless steels. M.Kuribayashi, H.Okabayashi (Res. Inst., Ishikawajima-Harima Heavy Industries Co. Ltd., Yokohama, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.365-72 (April 1983). In Japanese.
The influences of heat-treatment and cold-work on the mechanical properties at low temperature of cathodically-hydrogen-charged austenitic stainless steels are investigated. Austenitic stainless steels heat-treated at 1073K exhibit hydrogen embrittlement on a low temperature testing at 77K. The susceptibility to low temperature hydrogen embrittlement (LTHE) of seven kinds of austenitic stainless steels, heat treated at 0173K for 86.4 ks, can be arranged in the following order; SUS304>316>321>310=347>304L=316L. In the case of SUS304, the materials which were heat-treated at 923-1223K, especially at 1073-1173K, exhibit the LTHE. Cold-work shows a harmful effect on the LTHE. (11 refs.)

68629 The Bainite transformation and fracture mode of Fe-C-Mn high strength steel containing high carbon. Jin Tae Song (Dept. of Materials Engng., Hanyang Univ., Seoul, Korea).
J. Korean Inst. Met., vol.20, no.12, p.1062-9 (Dec. 1982). In Korean.
The morphology and fracture mode of the bainite in a Fe-C-Mn high-strength hypereutectoid steel have been examined by means of optical, scanning electron, and transmission electron microscopy, and also the isothermal decomposition of a Fe-1.35% C-2.06% Mn austenite has been investigated in connection with its hardenability. It is shown that the bainite transformation has taken place both by columnar type growth along grain boundaries forming the grain boundary allotriomorphic form and by nodular type growing into the grain, which are distinctly different from the usual bainite appearances. It is also shown that there may be no transition temperature from upper to lower bainite. It is found by the fractographic study that the fracture is predominantly transcrystalline showing cleavage facet. But, there are the small amount of quasi-cleavage and dimple fractures in bainite phases transformed at lower temperature, and also the fracture unit in them is relatively finer. It seems the inferiority of fracture ductility in this steel is attributed to proeutectoid cementites along austenite boundaries or a Widmanstatten type of cementites grown into bainite grains, which can be removed by the proper heat treatment alternative, rather than to its peculiar bainite. (17 refs.)

68630 About embrittlement process in amorphous metals. Chr.Janot, B.George, G.Marchal, P.Delcroix (Lab. de Phys. du Solide, Univ. de Nancy I. Vandoeuvre-les-Nancy, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.209-13 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Ribbons of metallic glasses whose general composition is $M_{80}X_{20}$ (M=Fe, Cr; X=P, C, Si) become brittle upon thermal annealing far below their crystallization temperature ($T_{EM}\simeq T_{CR/2}$). Bending tests in correlation with Mossbauer spectroscopy data (transmission and backscattering geometries) along with positron lifetime measurements show that this embrittlement could be due to the onset of precrystalline or microcrystalline layers each side of the ribbon. (13 refs.)

68631 Viscous failure of glass at high shear rates. J.H.Simmons, R.K.Mohr, C.J.Montrose (Dept. of Phys., Catholic Univ. of America, Washington, DC, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.439-42 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The viscosity of a soda-lime-silica glass was measured at high shear rates and 'pseudo-plastic' behavior was observed. An analysis of the data shows that the increased flow results from structural rearrangements in the glass. A characteristic failure stress is discovered and is related to a transition from ductile to brittle behavior. (2 refs.)

68632 Strength of chalcogenide glasses of the system Se-Ge-As. G.H.Frischat, B.-D.Michels (Arbeitsgruppe Glas, Tech. Univ. Clausthal, Clausthal, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.581-3 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Macro- and microstrength (four point bending strength σ_B, critical stress intensity factor K_{IC}, and load-independent microhardness L_2VH) were determined on different glasses of the chalcogenide system Se-Ge-As. $\sigma_{B3/2}$ and L_2VH values between 700 and 1400 Nmm^{-2}. The values on chalcogenide glasses are discussed with respect to other glass composition. (11 refs.)

68633 Tensile strength characteristics of 'perfect' silica fibers. C.R.Kurkjian, J.T.Krause (Bell Labs., Murray Hill, NJ, USA), U.C.Paek.
J. Phys. Colloq. (France), vol.43, no.C-9, p.585-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Interactions at the tip of macroscopic cracks in silica glass as they are influenced by time, temperature, stress and water concentration have been studied for some time. On the other hand, the same interactions when they occur at the 'perfect' surface of a virgin silica fiber are almost unstudied. The availability of precision-drawn silica fibers for lightguides has afforded an opportunity for such studies. Recent results have shown that such fibers are in fact flaw-free and that the statistical nature of their apparent strength is due solely to diameter fluctuations. It has been found that there are substantial differences between the mechanical behavior of these 'perfect' surfaces and that of normal 'flawed' surfaces. (9 refs.)

68634 Strength of optical fibres under combined stresses and aging in various environments. A.Zaganiaris, J.J.Balay, A.Guillerme (CNST, Lannion, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.587-90 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
This paper is an overview of the various parameters determining the mechanical behaviour of the optical fibres. Some recent results are presented and discussed in the light of fracture mechanics, Weibull statistics and surface fractographic analysis. Lifetime evaluations under various service environments are presented as a function of the mechanical properties of the fibre. The combined stress configuration analysis is tied to the realistic assumption that the fibres will be subjected in operation conditions to a complex stress field. The results together with those of short and long term stability of fusion splices, are particularly important to engineering field installations. (3 refs.)

68635 Dynamic fracture in borosilicate glasses. J.Cagnoux.
J. Phys. Colloq. (France), vol.43, no.C-9, p.591-4 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
Impact methods are used to create dynamic fracture in borosilicate glass. Piezoresistive gages located in a buffer-material are used to determine the time resolved stress during fracture. No fracture is produced by a tensile stress smaller than 9 kbar, in absolute value, for a duration pulse of 1.7 μs. Up to this threshold, for a short duration pulse the stress to cause fracture is higher than for a long duration pulse. Results are in accordance with the nucleation and growth of spall damage. It is assumed that the nucleation stage is an intergranular decohesion between boundaries of vitreous microphases. (12 refs.)

68636 Plasticity and fracture of inorganic glasses at high speed grinding. M.G.Schinker, W.Doll (Fraunhofer-Inst. fur Werkstoffmech., Freiburg, Germany).
J. Phys. Colloq. (France), vol.43, no.C-9, p.603-6 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
For different optical glasses the high-speed grinding process has been simulated by scratching the surfaces with a single point diamond tool in the speed range up to 100 m/s and the plasticity and fracture behavior of the glasses with single scratched grooves have been investigated by direct microscopic observation and by subsequent SEM-analysis. The generation of median cracks perpendicular to the surface is found to be restricted to low speeds in the range of metres per second, dependent on the type of glass. At higher speeds plastic grooving takes place and indication to very high temperatures are observed in the grooves. The plastic behavior of the glasses shows a glass and speed dependent change which has been associated to a change from quasi-isothermal yielding to adiabatic flow at higher temperatures in the scratched zone. (7 refs.)

68637 Dynamic fatigue of sodium-silicate glasses with high water content. S.Ito, M.Tomozawa (Rensselaer Polytech. Inst., Troy, NY, USA).
J. Phys. Colloq. (France), vol.43, no.C-9, p.611-14 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The stress-rate dependency of the mechanical strength of sodium silicate glass with high water content (up to ~25% by weight) was investigated. The glasses were prepared by drying commercial sodium silicate solution in an oven or an autoclave. The mechanical strength of the glasses was measured by a four point bending method at various stress rates. These glasses showed a strong stress rate dependency even in dried paraffin oil and the dependency increased with increasing water content; the value of n, a measure of the stress rate dependency, was approximately 5 for glasses with ~25 wt.% water. At the same time Young's modulus decreased with increasing water content. It is suggested that stress-induced motion of water is responsible for the increased stress rate dependency. In addition, the apparent value of Young's modulus decreased with decreasing stress rate. This phenomenon was explained in terms of the visco-elastic property of the glasses. (18 refs.)

68638 Thermal stresses in glass panels with multiple hot zones. S.T.Gulati, D.A.Nolan (Corning Glass Works, Corning, NY, USA), C.Janssen.
J. Phys. Colloq. (France), vol.43, no.C-9, p.615-18 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The interaction of two unequal circular hot zones on thermal stresses in the remaining cold region of rectangular glass panels is examined via finite element analysis. The results are then compared with those given by an approximate analytical solution. The FEM and analytical solutions agree to within 15%. The simplicity of the analytical solution, however, makes it a useful screening tool during the design phase of nonuniformly heated glass panels. The solution is also useful for assessing the probability of thermal fracture by comparing stresses in the region between the hot zones with those at the edge of the panel. (3 refs.)

68639 Concentration fluctuations as sources of internal stresses in metallic glasses. A.R.Yavari (Ecole Nat. Superieure D'Electrochimie et d'Electrometall., Domaine Univ., Saint Martin d'Heres, France).
J. Phys. Colloq. (France), vol.43, no.C-9, p.619-22 (Dec. 1982). [received: April 1983] (Physics of Non Crystalline Solids. Proceedings of the 5th International Conference, Montpellier, France, 5-9 July 1982).
The author shows that concentration fluctuations frozen in at T_g, result in microscopic regions of large positive or negative internal stresses in the asquenched glass. The negative and positive stresses correspond to zones rich in free-volume and anti-free volume respectively. The effect is particularly large in ferromagnetic Invar-type alloys. It is suggested that internal stresses due to concentration fluctuations can result in the production of quasi-dislocations detected by the field-dependence of the approach to magnetic saturation and density fluctuations detected in neutron small-angle scattering measurements. A connection with embrittlement of annealed specimens is also indicated. (18 refs.)

68640 Low temperature fatigue fracture of metals and alloys. B.I.Verkin, N.M.Grinberg, V.A.Serdyuk, L.F.Yakovenko (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.145-687 (April 1983).
Using the data available in the literature and the present authors' previous results the present-day studies of low temperature fatigue fraction of metals and alloys are reviewed in terms of the physics of metals. The effect of low temperatures on the fatigue life and fatigue limit of different crystal lattice types of metals and alloys is considered. The correlation between an increase in fatigue life and a reduction in temperature is analysed and certain exceptions to this correlation are pointed out. The problem of both the simultaneous influence of temperature and environment and the separate effects of each of these factors on cyclic fatigue life is discussed. It has been found that a superconducting transition affects the cyclic fatigue life of certain superconductors and that the effect of the superconducting state on fatigue life is ambiguous; this is accounted for by the varying plasticity of the superconductor. The experimental data on dislocation structure and fatigue crack nucleation at temperatures down to 4.2K are discussed. Particular attention is given to the effect of low temperatures on the rate of fatigue crack growth and the threshold points of this stage. (98 refs.)

68641 On the dependence of fracture toughness on metallurgical factors. N.Tsangarakis (Army Materials & Mechanics Res. Center, Watertown, MA, USA).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.269-76 (April 1983).
The impact of metallurgical fators, such as microstructure, impurities and grain size on the value of fracture toughness, is discussed. Some evidence exists for the beneficial effects of retained austenite, low impurity content and small grain size in improving the fracture toughness of steels. In materials with a Widmanstatten structure, increasing the grain size has a beneficial effect on fracture toughness. If the chemistry of an alloy is known, it is possible to design heat treatments so as to improve effectively the resistance to fracture of the said alloy. Research on the fracture behavior of metallic materials should be accompanied by a complete metallographic examination and correlation of metallurgical factors with the material behavior under the condition of a propagating crack. (29 refs.)

68642 Analytical description of ageing of polyamide 6 subjected to fatigue failure. M.Nowak (Politech. Wroclawska, Wroclaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.3, p.435-54 (1981). In Polish.
The variation of fatigue behavior of polyamide 6 (PA 6) during ten years of ageing is presented. The hypothesis of the ageing process of polymers, based on experimental results and general physico-chemical properties of polymers has been proposed in the following form: the fatigue limit of thermoplastics Z aged in laboratory environment conditions decreases in agreement with a Gaussian distribution (with parameters) and a general empirical equation. (44 refs.)

68643 Theoretical fatigue life of helically stranded optical fibres. M.Fox (BICC Res. & Engng. Ltd., London, England).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.253-60 (May 1983).
The design of optical fibre cables currently preferred by BICC ordinarily produces little or no tension or torsion in the fibres. Bending them into helical form, however, causes a permanent stress which could give rise to static fatigue. In a recent paper, the probability that a bent fibre will fail owing to static fatigue was calculated. The calculation is extended in the present paper to take account of proof-testing. Assuming reasonable values for the parameters, it appears that a fibre of 125 μm diameter, proof-tested at 0.5% strain and subsequently bent to a radius of not less than 25 mm, would certainly survive for 40 years. (16 refs.)

68644 Low-temperature studies of laminates. I. Effect of low temperatures on the mechanical properties. B.Biernacki (Inst. Okretowy, Politech. Gdanska, Gdansk, Poland).
Polim. Tworzywa Wielkoczasteczkowe (Poland), vol.27, no.4, p.164-7 (April 1982). In Polish. [received: March 1983]
The studies of the strength properties of laminates prepared from home-made semiproducts have shown their good resistance to the action of low temperatures. A negative effect of thermal shocks on the material structure and mechanical characteristics has been observed. This effect depends primarily on the temperature difference between the cooling medium and the material being cooled. The highest resistance to the action of thermal shocks had laminates based on Polimal 139 polyester resin. (4 refs.)

68645 Fracture surfaces and mechanical properties of tungsten heavy metals. H.Danninger, M.Schreiner, G.Jangg, B.Lux (Inst. fur Chem. Technol. Anorganischer Stoffe, Tech. Univ. Wien, Wien, Austria).
Prakt. Metallogr. (Germany), vol.20, no.2, p.64-73 (Feb. 1983). In English, German.
A clear relation can be stated between the mechanical properties and the appearance of the fracture surfaces of W heavy metals sintered differently. Those alloys prepared from green compacts that were not pre-reduced before sintering are extremely brittle, and at the fracture surfaces only intergranular fracture can be observed, which effects are apparently caused by oxygen contamination of the phase boundaries. The fracture surfaces of pre-reduced and therefore ductile samples, in contrast, exhibit a large amount of transgranular fracture as the crack runs through the sample without being deflected by phase boundaries. The microcracks formed at the W-W grain boundaries at high degrees of deformation are stopped and separated by the binder and cannot propagate along the phase boundaries. The binder is dispersion hardened by oxide particles and since it absorbs the entire deformation energy naturally both strength and ductility are lowered. (9 refs.)

68646 Strain localization during fatigue of precipitation-hardened aluminium alloys. Jia-Kuen Lee, C.Laird (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).
Philos. Mag. A (GB), vol.47, no.4, p.579-97 (April 1983).
Fatigue tests of Al-3.8 wt.% Cu containing θ'' precipitates have been carried out at two plastic strain amplitudes, 9.0×10^{-4} and $9.2 \times^{-5}$ corresponding to the high- and low-strain regions of the plateau in the cyclic stress-strain curve. The tests were interrupted at points in life both before and after the occurrence of peak hardening. During interruptions the specimens were repolished and retested for a quarter cycle in tension. The slip offsets thus produced were measured by interferometry and the strains revealed were compared with the overall value imposed during the quarter cycle of straining. Persistent slip bands (PSBs) start to form just before the hardening peak and the strain was observed to localize within the PSBs. With more cycles, the localization intensifies both in existing micro-PSBs and by the creation of new micro-PSBs. After the peak stress is attained, zero or minimal nucleation of micro-PSBs was observed. Nearly all of the plastic strain after the peak is localized in the PSBs and is manifested as surface slip steps. The average value of localized strain ranges from 0.3 to 0.6, two orders of magnitude higher than that observed in copper, and the volume fraction of PSBs was observed to be extremely low throughout the plateau. (17 refs.)

68647 Arsenic and platinum deposition during cathodic hydrogenation. M.B.Lewis, K.Farrell (Metals & Ceramics Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Scr. Metall. (USA), vol.17, no.3, p.365-9 (March 1983).
Describes the finding of significant accumulation of promoters (or poisons) at the cathode during cathodic hydrogenation. Aggregation of supposedly inert platinum anode material also occurred and was enhanced by the presence of the promoter. It is suggested that these deposits should be considered in hydrogen embrittlement tests made under dynamic cathodic electrolysis. (9 refs.)

68648 Precipitation induced embrittlement after thermal exposure of high-manganese, austenitic retaining-ring steels. J.Albrecht (Brown Boveri Res. Center, Baden, Switzerland).

Scr. Metall. (USA), vol.17, no.3, p.371-4 (March 1983).

An investigation was carried out in order to study the response of two steels, X55MnCr18 (18%Mn, 5%Cr and 0.5%C) and X5CrMn1818 (18%Mn, 18%Cr, low C, N alloyed) to thermal exposure. The results show that both steels react to high temperature exposure with a loss of fracture toughness. This loss is due to precipitation of grain boundary carbides—known as sensitization—and is quite common in carbon-alloyed chromium steels. (5 refs.)

68649 Crack-tip heating in steel during cyclic loading. P.J.Loos (Hughes Tool Co., Houston, TX, USA), F.R.Brotzen.

Scr. Metall. (USA), vol.17, no.3, p.389-92 (March 1983).

Concerns the experimental determination of crack-tip temperature by infrared techniques during low-frequency fatigue loading. Specimens were machined from a bar of hot-rolled AISI 4135 steel. Load and displacement were recorded while the crack-tip temperature rise was noted. The results obtained indicate clearly that infrared techniques can be used advantageously in the study of fracture of ductile materials. (4 refs.)

68650 On the existence of hydrostatic stress fields for mode II hydrogen embrittlement. R.Magdowski, W.W.Gerberich (Dept. of Chem. Engng., Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).

Scr. Metall. (USA), vol.17, no.3, p.421-2 (March 1983).

In a recent paper on hydrogen embrittlement in mode II loading (see Br. Corros. J., vol.17, p.18, 1982) R.F. McGuinn and M. Aballe reported about static mode II testing of externally charged cold drawn bars. Their results showed hydrogen embrittlement which led the authors to the conclusion that, in contradiction to former understanding, a significant bulk hydrostatic stress is not a necessary condition for hydrogen cracking. The present authors wish to point out that because these investigators only used the pure elastic solutions their work may contain an interpretative error. (6 refs.)

68651 Influence of the breakdown mechanism on the behavior of lead-antimony alloys with an alternating load. T.F.Elsukova, N.I.Afanas'ev, A.N.Makaeva (V.D. Kuznetsov Physicotech. Inst., Tomsk State Univ., Tomsk, USSR).

Sov. Phys. J. (USA), vol.25, no.8, p.733-7 (Aug. 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.8, p.61-4 (Aug. 1982). [received: April 1983]

For the example of Pb-Sb alloys, the influence of aging is investigated, as a function of its mechanism, on the resistance to fatigue deformation, leading to rupture along the grain boundaries. It is shown that continuous breakdown increases the cyclic life, whereas discontinuous breakdown considerably reduces it. The most effective means of suppressing discontinuous breakdown, and hence increasing the resistance to grain-boundary fatigue breakdown, is by doping with elements which reduce the mobility of the grain boundaries, such as tellurium in lead. Doping with elements that facilitate discontinuous breakdown (such as As in Pb-Sb) leads to significant reduction in the fatigue resistance. (10 refs.)

68652 The influence of structure parameters on strength and fracture toughness of brittle covalent crystals and corresponding sintered materials. V.I.Trefilov (Inst. for Problems of Material Sci., Kiev, Ukrainian SSR), M.M.Ristic, Ju.V.Milman, D.P.Uskokovic, I.V.Cridneva.

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.497-504

It was the theoretically and experimentally analyzed structure sensitivity of the mechanical properties of covalent crystals and some other sintered materials that enables a significant increase in material strength and the choice of an optimal method for the synthesis of corresponding complex systems. (12 refs.)

68653 The influence of titanium carbide and bonding phase composition on the properties of titanium carbide-steel cermets. S.S.Kiparisov, Z.D.Khochol-ava, V.K.Narva (Inst. of Metall., Tbilisi, Georgian SSR).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.511-18

Conditions of obtaining titanium carbide steel Kh12M (30 and 50 wt.% TiC) alloys at different composition of titanium carbide (C_{bond} content-14.4 to 19.1 wt.%) have been investigated. Optimal regimes of pressing, sintering and heat treatment of sintered materials of TiC-steel (Kh12M, Kh4H2M8) with different content of carbon (0.5-1.5%) are recommended. It was established that at sintering of alloys being deficient in carbon, carburisation of TiC takes place causing decarburization of steel bonding phase. This complicates achieving optimum strength properties also after heat treatment. Hardness after sintering and heat treatment, compressive and bending strength and durability decrease with increasing carbon deficiency in titanium carbide. The decrease of carbon content in composition of steels X12M and X4H2M8 causes some lowering of hardness of sintered and thermally treated material. (4 refs.)

68654 Effects of cold rolling and annealing on the mechanical properties of 90W-7Ni-3Fe heavy alloys. M.Yodogawa (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.519-25

The relationship between ultimate tensile strength (UTS), elongation and the microstructure of cold rolled and annealed 90W-7Ni-3Fe heavy alloys was investigated using tensile tests, hardness tests, microscopy and fractography. Due to strain hardening, the UTS of the cold rolled unannealed alloy increased from 900 MN/m^2 for the unrolled alloy to 1800 MN/m^2 for alloy cold rolled 90% and the elongation drops drastically. By annealing at temperatures up to 700°C a further increase in UTS caused by segregation of tungsten in the matrix phase and by strain aging of the tungsten particles was observed. With higher annealing temperatures recrystallization of the matrix decreased the strength; this was accompanied by increase in elongation. Above 1000°C, recrystallization of the deformed tungsten particles started, causing a remarkable change in the fracture mode of the alloy: the fracture appearance of the matrix phase was always ductile whereas the tungsten particles showed cleavage fracture mode below 1000°C and grain boundary fracture in the recrystallized state above 1000°C. (12 refs.)

68655 Mechanical behaviour of eutectic superalloys. M.McLean (Div. of Materials Applications, NPL, Teddington, England).

In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.1-19

The mechanical properties of in-situ composites intended for use as gas turbine materials are reviewed. Particular emphasis is placed on the current understanding of strengthening and fracture mechanisms of these materials. The need to modify current methods of data representation, that have been developed for more conventional materials, in order to improve property extrapolation and design procedures are highlighted. (26 refs.)

68656 The low cycle fatigue behavior of three advanced nickel-base eutectic composites. T.Ishii, D.J.Duquette, N.S.Stoloff (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA).

In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.59-68

The low cycle fatigue behavior at 25°C and 825°C of three advanced nickel-base eutectics is described. Fatigue lives are shown to obey a linear relation with plastic strain range (Coffin-Manson relation) but lives are much lower than are observed for conventional metals and alloys. Cyclic hardening and softening were observed in each alloy at 25°C; however, this behavior differs from the classical saturation behavior observed with isotropic materials. (8 refs.)

68657 Fatigue crack growth in Co and Ni base directionally solidified eutectic composites. C.Hoffmann, P.Bhowal, A.J.McEvily (Metall. Dept., Univ. of Connecticut, Storrs, CT, USA).

In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.69-83

A study of fatigue crack growth behavior in four directionally solidified eutectic composites has been carried out in air at room temperature and at 870°C (1600°F). The alloys investigated included two cobalt-base alloys, CoTaC and CoTaC+Cr, and two nickel base alloys, γ'-Mo and γ/γ'-δ. Fatigue crack growth was studied in directions parallel and perpendicular to the solidification direction. It was found that the addition of chromium to the CoTaC alloy strengthened the interface and promoted trans-fiber crack growth. In addition, the effect of interlamellar spacing on the rate of fatigue crack growth was examined for the γ/γ'-δ alloy. A reduction in interlamellar spacing reduced the crack growth rate. (14 refs.)

68658 The role of solidification rate on fiber distribution and mechanical properties of a directionally solidified nickel base-TaC eutectic. J.L.Water (General Electric Corp. Res. & Dev., Schenectady, NY, USA).

In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.85-102

A nickel base-TaC eutectic alloy consisting of 53 wt.% Ni, 11 W, 3 Re, 5 Co, 3 Mo, 2 Al, 21.67 Ta and 1.33 C was directionally solidified at rates from 0.32 to 3.8 cm/hr. Samples were taken from the regions of aligned TaC fibers and tested in tension at 1000°C and in stress-rupture. The fiber density increased from 1×10^6 fibers/cm^2 at 0.32 cm/hr to 27×10^6 fibers/cm^2 at 3.8 cm/hr. The stress-rupture life at 927°C and 275.6 MPa ranged from 4 hrs for samples solidified at 0.32 cm/hr to 4187 hrs for the sample solidified at 2.54 cm/hr at which time the test was terminated. Examination, by transmission electron microscopy, of the samples tested at 1000°C in tension, to just the beginning of fiber breakage, revealed a change in the mode of deformation of the nickel-base alloy matrix with increasing fiber density. It was also seen that the TaC fibers deformed by two mechanisms; by slip and by the formation of stacking faults. (16 refs.)

68659 Off-axis mechanical properties of a cellular Al-Al_3Ni directionally solidified eutectic. D.W.Hetzner (Timken Co., Canton, OH, USA), B.F.Oliver, W.T.Becker.

In Situ Composites IV. Proceedings of the Fourth Conference on In Situ Composites (CISC IV), Boston, MA, USA, 16-19 Nov. 1981 (North-Holland: New York, USA 1982), p.329-40

Ingots having a cross-sectional area of 1.27 cm×10.8 cm were directionally solidified for testing off-axis tensile properties. To avoid macroscopic banding due to inductive melting and thermal convection, growth rates of 2.2 cm/min were required. The resulting solidification structures were cellular. The macroscopic tensile behavior of the eutectic alloy was similar to that observed for mechanically formed fiber-reinforced composite materials; in particular, three distinct modes of fracture occurred. In Region I, where the angle (ϕ) between the growth direction and the tensile axis was small, the tensile strength of the composite was inversely proportional to $\cos^2\phi$. In region II ($20°\leq\phi\leq55°$) and region III ($60°\leq\phi\leq90°$), the tensile strength of the composite was inversely proportional to $\sin\phi$, $\cos\phi$, and $\sin^2\phi$, respectively. For all regions, failure was initiated by the fracture of large Al_3Ni intercellular blades. (13 refs.)

68660 Wear-resistant cobalt-base alloys. K.C.Antony (Cabot Corp., Kokomo, IN, USA).
J. Met. (USA), vol.35, no.2, p.52-60 (Feb. 1983).
Microstructurally, wear-resistant cobalt-base alloys consist of hard particles (Cr_7C_3) dispersed in cobalt-rich (Co>50%) solid solution matrix alloys (generally Co-Cr-W/Mo). Recent investigations have shown that the adhesive and cavitation-erosion wear characteristics of these alloys are determined by the composition of the matrix alloy and are influenced to a large extent by a strain-induce FCC→HCP allotropic transformation in the matrix alloy. It has been shown that the cobalt content in the matrix alloy can be decreased to approximately 30% without significantly degrading relevant wear or corrosion properties. Toughness and abrasive wear resistance on the other hand, are determined primarily by carbide volume fraction and morphology. (12 refs.)

68661 A study of cavitation erosion of cast iron. T.Okada, Y.Iwai (Dept. of Mech. Engng., Fukui Univ., Fukui, Japan), A.Yamamoto.
Wear (Switzerland), vol.84, no.3, p.297-312 (1 Feb. 1983).
Cavitation erosion tests were carried out in ion-exchanged water using four cast irons (gray or spheroidal graphite) together with carbon steels with the same matrix as the cast irons. The erosion mechanism of the cast irons is explained through the growth of eroded cracks which depends on both the notch action of graphite and the notch sensitivity of the matrix. The erosion resistances of the cast irons and of the carbon steels were compared. A linear relation was obtained from the logarithmic curve between the reciprocal of the maximum mass loss rate and $H_V^2/E\beta_g$ (where H_V is the Vickers microhardness, E is the elastic modulus and β_g is the fatigue strength reduction factor for cast iron). It is thus concluded that the cavitation erosion resistance of cast iron is less by a factor of $(1/\beta_g)^{1.7}$ than that of carbon steel of the same hardness as the cast iron matrix. (12 refs.)

68662 The effect of carbide volume fraction on the low stress abrasion resistance of high Cr-Mo white cast irons. J.K.Fulcher, T.H.Kosel, N.F.Fiore (Dept. of Metall. Engng. & Materials Sci., Univ. of Notre Dame, Notre Dame, IN, USA).
Wear (Switzerland), vol.84, no.3, p.313-25 (1 Feb. 1983).
High chromium white cast irons display a number of advantages in abrasive wear applications. Their composition may be adjusted so that they contain moderate amounts of chromium yet solidify to produce massive chromium-rich carbides in an austenitic matrix of sufficient hardenability to be transformed to martensite with relatively simple heat treatment. The role of carbide volume fraction (CVF) in developing abrasion resistance was investigated using a series of alloys with varying CVF but with constant matrix and carbide compositions. The low stress abrasion resistance of the alloys against quartz and Al_2O_3 was measured with a dry abrasive rubber wheel abrasion test. The abrasion resistance passed through a maximum at an intermediate CVF, near the eutectic composition, for the softer quartz, while the abrasion resistance increased monotonically with the CVF for tests against the harder Al_2O_3. Scanning electron microscopy showed that for quartz abrasion the reversal in the trend of wear versus CVF which occurred at the eutectic composition was caused by spalling and pitting of the massive primary M_7C_3 carbides in the hypereutectic alloys. This phenomenon did not occur in the Al_2O_3 abrasive tests, in which a monotonic increase in wear resistance with CVF was observed. (11 refs.)

68663 A study of abrasive wear mechanisms in cobalt-base alloys. H.R.Shetty, T.H.Kosel, N.F.Fiore (Dept. of Metall. Engng. & Materials Sci., Univ. of Notre Dame, Notre Dame, IN, USA).
Wear (Switzerland), vol.84, no.3, p.327-43 (1 Feb. 1983).
Single-point scratch tests were used to investigate material removal mechanisms in two cobalt-base powder metallurgy alloys 6 and 19. Each alloy was produced with fine, medium and coarse chromium-rich M_7C_3 carbides in a cobalt-rich FCC matrix phase. The scratch test study was designed to simulate low stress abrasion conditions by using single quartz abrasive particles as scratch tools, and the results are compared with those from scratches made using regularly shaped diamond tools. Single- and multiple-pass scratches were made with several different loads using Vickers diamond pyramids and single quartz abrasive particles on metallographically prepared surfaces. Single-pass scratches were also made on preworn surfaces by using a Vickers diamond. Single-pass diamond scratches exhibited ploughing and extensive coarse slip bands in the matrix phase of metallographic specimens. Evidence of carbide deformation and of slip band cracking of the matrix material was observed also. Coarse slip bands were not observed on preworn surfaces. Scratch tests with quartz particles exhibited slip band cracking, smeared matrix material over the carbides and cracking and pulling out of carbides similar to observations with diamond tools. However, extensive ploughing and shear lip formation were not observed in quartz scratches. (13 refs.)

68664 The influence of hardness on the resistance to wear by paper. R.G.Bayer (IBM Corp., Endicott, NY, USA).
Wear (Switzerland), vol.84, no.3, p.345-51 (1 Feb. 1983).
Abrasive wear data for a wide range of materials sliding against paper are compared to establish a general dependence on hardness of the abraded material. Three regions for the hardness dependence are identified. In all three regions, the wear rate depends on $(\text{hardness})^{-n}$. In the region for which the hardness of the abrasive is larger than that of the abraded material, $n \approx 1$; in the region where the hardnesses are similar, $n \approx 10$; in the region where the abraded material is harder, $n \approx 5$. (11 refs.)

68665 The processes accompanying metal wear in polymer-containing abrasive media. T.V.Dmitriyeva, L.M.Grayevskaya (Inst. of Macromolecular Chem., Acad. of Sci., Kiev, Ukrainian SSR).
Wear (Switzerland), vol.84, no.3, p.353-9 (1 Feb. 1983).
The lapping process was studied. It was found that metal wear is determined by a series of factors: polymer or oligomer quantity in the heterophase system, lapping-in pressure, working time of the polymer-abrasive paste or suspension and the accumulation of particles from the lapped metal. (6 refs.)

68666 Wear of aluminium under dry sliding conditions. R.S.Yaseen, E.S.Dwarakadasa (School of Production Engng. & Metall., Univ. of Technol., Baghdad, Iraq).
Wear (Switzerland), vol.84, no.3, p.375-9 (1 Feb. 1983).
The wear behaviour of pure aluminium exhibits two distinct regions of wear in the low load ranges marked by a sharp transition point. At very low loads wear is apparently controlled by a purely oxidative mechanism, while at moderately high loads it changes to a combined oxidative-cum-metallic type of wear. The transition is marked by a volume wear rate of about 10^{-8} cm^3 cm^{-1} and the load at which this transition takes place is a function of the wear conditions of speed, relative hardness and roughness of the disc surface as well as the ambient conditions of temperature and humidity. The purely severe metallic wear observed by other investigators is considered to occur only under very high bearing loads. (15 refs.)

68667 The erosion rate of reaction-bonded SiC containing various amounts of free silicon. J.L.Routbort, A.P.L.Turner (Materials Sci. & Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).
Wear (Switzerland), vol.84, no.3, p.381-5 (1 Feb. 1983).
Reports the results of erosion studies obtained on two types of reaction-bonded (RB) SiC having different amounts of free silicon. The results confirm the existence of a threshold for erosion and a particle-size-dependent velocity exponent. The steady state erosion rate not only is a sensible function of the amount of free silicon in RB SiC but depends on the microstructure. (8 refs.)

68668 Correlation of erosion with mechanical properties in metals. D.G.Rickerby (Joint Res. Centre, Ispra Establ., Comm. of the European Communities, Ispra, Italy).
Wear (Switzerland), vol.84, no.3, p.393-5 (1 Feb. 1983).
It is shown that there is apparently little to choose between the mechanical energy density and thermal energy density correlations as far as the erosion of pure metals is concerned. Scatter in the former case would undoubtedly be reduced by the use of mechanical properties measured at appropriate dynamic strain rates. A proper comparative test of the predictive capabilities cannot be made for alloys since a similar set of data obtained under constant experimental conditions is not available in the literature. Addition of relatively small amounts of alloying elements, however, can substantially modify the stress-strain curve while leaving the thermal properties virtually unchanged. As the erosion behaviour of alloys typically differs markedly from that of the parent metal, a better correlation with mechanical rather than thermal properties might consequently be expected. 68669 The effects of calcining and sintering conditions on the permeability and loss of Mn-Zn-Fe ferrite. Mun-Cheol Paek, Ho-Bin Im, Su-Il Pyun.
Trans. Korean Inst. Electr. Eng., vol.32, no.1, p.24-9 (1983). In English.
The effects of calcining and sintering conditions on the initial permeability and loss of $Mn_{0.54}Zn_{0.4}Fe_{0.06}{}^{2+}Fe_2O_4$ were investigated using specimens calcined at 900°-1110°C for 3 hrs in air, and then sintered at 1200-1275°C for 3 hrs in an atmosphere of 5% O_2+95% N_2 gas mixture, followed by cooling in N_2 atmosphere. The composition of specimens was so selected to hold nearly zero-magnetocrystalline anisotropy constant, K_1, and a small value of magnetostriction constant, λ_s, at room temperature. The specimen calcined at 950°-1050°C in air showed the maximum initial permeability, μ_i, regardless of its sintering temperature. At constant calcining temperature of 950-1050°C, permeability increased with sintering temperature up to 1250°C and then remained constant or slightly decreased. The higher the calcining and sintering temperatures, the higher was the value of the loss factor, Q, of ferrite. The variation of initial permeability and loss was discussed in terms of pores for lower calcining and sintering temperatures, and in terms of discontinuous grain growth for higher calcining and sintering temperatures. A schematic contour diagram of initial permeability and μQ product has been constructed, related to calcining and sintering temperatures. (8 refs.)

81.60 CORROSION, OXIDATION AND SURFACE TREATMENTS

68670 Ion polishing with the aid of a planarizing film. L.F.Johnson, K.A.Ingersoll (Bell Labs., Murray Hill, NJ, USA).
Appl. Opt. (USA), vol.22, no.8, p.1165-7 (15 April 1983).
An ion polishing technique employing a planarizing film in conjunction with ion-beam erosion at the planarizing angle was used to remove surface irregularities associated with conventional polishing of optical surfaces. By maintaining a planar surface throughout the erosion process, nonuniform erosion resulting from faceting, redeposition, and ion reflection is eliminated. Smooth surfaces on fused quartz are obtained by erosion of a planarizing film of photoresist at an angle of 60°C. The method is applicable to a wide variety of materials and may be useful for removing the surface roughness limitation on the laser-induced damage threshold of optical surfaces. (23 refs.)

68671 X-ray photoelectron spectroscopy study of hydrogen plasma interactions with a tin oxide surface. J.H.Thomas,II (RCA Labs., David Sarnoff Res. Center, Princeton, NJ, USA).
Appl. Phys. Lett. (USA), vol.42, no.9, p.794-6 (1 May 1983).
Tin oxide thin films were exposed to an RF excited hydrogen plasma (100 mTorr) for various times. The plasma system was operated in a self-biased mode. X-ray photoelectron spectroscopy analysis of vacuum transferred samples shows that SnO_2 is reduced. A thin self-limiting layer of elemental Sn forms on the reduced film to a thickness of ~10 Å. (17 refs.)

68672 Investigation of phosphosilicate glass layers by partial etching. P.Jagodzinski, E.Jagodzinska (Inst. of Electron Technol., Sci. & Production Centre of Semiconductors, Warszawa, Poland).
Electron Technol. (Poland), vol.13, no.1-2, p.19-28 (1980).
The partial etching method as a tool for investigation and examination of phosphosilicate glass (PSG) layers is compared with the routine method of diffusion into a monitoring wafer. The advantages of partial etching method are presented. They include independence of the silicon surface saturation effect, feasibility of determining phosphorus content profile in the glass, and a possibility of investigating complete integrated circuits with the aim of determining the fabrication parameters and of diagnostics. PSG etching rate versus composition curves have been determined and verified for the cases of P-etch and 100:1 H_2O:HF solution. (6 refs.)

68673 Crystallographic anisotropies in electrochemical etching of Pt. R.Caracciolo, L.D.Schmidt (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.603-7 (March 1983).
Single crystal microspheres of Pt are examined by scanning electron microscopy following electrochemical and chemical etching in chloride and cyanide solutions. In all cases, a single major crystal plane is formed which is not the close packed (111) plane. Rates of dissolution and facet formation also vary among planes and with etching conditions. The largest anisotropy occurs with aqua regia where initial attack is exclusively near (210) but only (110) facets are formed. The (111) and (100) planes are attacked in aqua regia only from their edges, but eventually these orientations are transformed completely into (110) facets. Electrochemical chloride etching with a-c potentials produces large smooth planes near (100), and the (111) plane is attacked readily to form (100) facets. Electrochemical cyanide etching produces the most rapid attack of the (111) orientation to produce facets of (110). Possible mechanisms for these processes and implications for preparation of Pt electrodes are discussed. (19 refs.)

68674 Some illumination on the mechanism of SiO_2 etching in HF solutions. H.Nielsen, D.Hackleman (Hewlett-Packard Co., Corvallis, OR, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.708-12 (March 1983).
The etching of SiO_2 in aqueous buffered HF solutions can be impeded or stopped through the application of an electric field. In CMOS fabrication, very low levels of light can cause the effect. Parallel reaction paths are proposed for the dissolution process, coupled with the electric field's ability to stop or redirect the reaction at an intermediate step. (6 refs.)

68675 Phenomenological model for silicon oxidation in dry oxygen in the presence of HCl. A.I.Ellis, K.M.Gardiner, T.E.Cyr (Solid State Electronics Div., Honeywell Inc., Plymouth, MN, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.721-4 (March 1983).
Thermal oxidation of silicon to form a thin SiO_2 layer is one of the most important processes in VLSI and VHSIC technology. The authors propose a conceptually simple modification of the Deal-Grove model (1965) based on the assumption that the oxygen atoms impacting the oxide surface have a definite probability of penetrating to a certain depth. Expressions useful for data analysis and simulation (SUPREM II and III) are given. (13 refs.)

68676 Laser processing of thin surface layers in semiconductors. V.A.Zuev, V.G.Litovchenko, V.G.Popov.
Kvantovaya Elektron., Kiev (USSR), no.23, p.33-43 (1982). In Russian.
Methods of using laser light to investigate and control the characteristics of thin surface layers of semiconductors and of structures based on them are surveyed. Defect formation, changes in band and crystal structure, electrochemical and photochemical aspects, laser annealing of ion-implanted layers and the application of lasers in semiconductor device technology are discussed. (35 refs.)

68677 Surface morphology during ion etching. The influence of redeposition. R.Smith, S.S.Makh, J.M.Walls (Loughborough Univ. of Technol., Loughborough, England).
Philos. Mag. A (GB), vol.47, no.4, p.453-81 (April 1983).
Ion beam etching is a well-established technique for micro-machining surfaces. It is used extensively in surface analysis with techniques such as Auger electron spectroscopy, ESCA and SIMS, both for surface cleaning and composition-depth profiling. It is also a potentially important technique in semiconductor device fabrication, where the provision of vertical grooves is required and where redeposition is a potentially serious problem. In this paper a two-dimensional theory of the build-up of material redeposited during ion etching is presented, together with complementary experimental results which demonstrate the extent of the problem in the production of certain devices. The analysis is based on the method of characteristics, as in the theory of nonlinear waves, and computational examples are used to investigate the build-up of material on initially rectangular grooves as a function of beam energy and groove width. (23 refs.)

68678 AES study of the low-pressure oxidation of Si(100): electron beam effects. B.Carriere, A.Chouiyakh, B.Lang (Lab. de Cristallographie, Univ. Louis Pasteur, Strasbourg, France).
Surf. Sci. (Netherlands), vol.126, no.1-3, p.495-501 (March 1983). (ECOSS-5. Proceedings of the Fifth European Conference on Surface Science, Gent, Belgium, 24-27 Aug. 1982).
The growth of the oxide layer (0-25 Å) on Si(100) is followed by AES at 5×10^{-6} Torr O_2 and 25°C, using continuous electron beam irradiation. Three breaks in the AST plots are correlated with changes in Si bonding states deduced from the evolution of the fine structure of the Si LVV spectrum. A 4-step model is proposed: chemisorbed O, intermediate oxide, thin-layer SiO_2 and bulk-like SiO_2. (11 refs.)

68679 Cathodic protection of steel in sea water under heat-transfer conditions. P.E.Francis, A.S.Dolphin.
Report NPL-DMA(A)55, Nat. Phys. Lab., Teddington, England (June 1982), 44 pp.
The effect of heat transfer on the parameters required for cathodic protection of steel in sea water has been investigated. ASTM sea water was used for the study to ensure comparability between results. Heat transfer was varied by changing the internal temperature of the specimens between ambient and 110°C. The temperature of the water was either 5 or 20°C with linear flow velocities past the specimens of 5 or 50 cm s^{-1}. Under most conditions calcareous deposits which formed on the specimens were nonporous to oxygen and the cathodic currents were due to the reaction of water, but on pre-corroded surfaces the deposits were more porous so that cathodic currents were increased by oxygen reduction at the surface of the metal. Current densities on unheated specimens ranged from 10 mA m^{-2} for surfaces with good calcareous deposits to 7000 mA m^{-2} for bare surfaces when the flow velocity was 50 cm s^{-1}. The minimum cathodic potential required for protection of the steel specimens was not changed by heat transfer, and the corrosion rate was negligible at potentials more negative than −775 mV(Ag/AgCl) under all conditions. (14 refs.)

68680 Formation, transformation and dissolution of phases formed on surfaces. D.W.Shoesmith.
Report AECL-6840, Atomic Energy Canada Ltd., Chalk River, Ont. (March 1983), 63 pp.
The growth of films, and their transformation and dissolution reactions, coupled with such processes as stress and fatigue, are the essence of most industrial corrosion problems. A detailed understanding of the reaction mechanisms is essential if corrosion is to be prevented, or at least controlled. Corrosion studies require a multidisciplinary approach involving chemists, metallurgists and materials scientists. The author concentrates on the chemical and electrochemical aspects, with particular emphasis on some corrosion processes of interest to the Canadian nuclear industry. (49 refs.)

(inc. stress corrosion cracking; anticorrosion)

68681 Impedance studies of the growth of porous magnetite films on carbon steel in high temperature aqueous systems. J.R.Park, D.D.MacDonald (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA).
Corros. Sci. (GB), vol.23, no.4, p.295-315 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
The growth of porous magnetite on carbon steel in high temperature chloride solution has been studied using the a.c. impedance technique. At both 200 and 250°C the reciprocal of the polarization resistance, which is proportional to the corrosion rate, at first increases with time, but eventually tends to a constant value. Accordingly, the early stages of corrosion are autocatalytic, but at longer times a linear rate law is observed. The early autocatalytic stage is attributed to the gradual development of a highly aggressive solution within the porous film due to cation hydrolysis and transport of chloride ions from the bulk solution into the pores. The frequency dispersion of the impedance of the growing film has been successfully accounted for by a finite transmission line model. Numerical analysis has shown that the total impedance is a sensitive function of the film thickness and of the impedances along the pore wall and at the base of the pore. (15 refs.)

68682 Determination of the long term corrosion behavior of coated steel with AC impedance measurements. M.Kendig, F.Mansfeld, S.Tsai (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA).
Corros. Sci. (GB), vol.23, no.4, p.317-29 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
A previous study (see F. Mansfeld et al., Corrosion vol.38, p.478, 1982) of the AC impedance of thin polymer films on aluminum alloys, steel, and phosphated steel, determined over a wide frequency range, has resulted in a general model for the electrochemical impedance across the coated surfaces. According to this model, penetration of the coating by the electrolyte results in an impedance behavior which is typical of a dielectric film short-circuited by conducting electrolytic paths perpendicular and parallel to the polymer/metal interface. Comparison of the time dependence of the impedance of coated steel substrates with the impedance across a free film has demonstrated that the corrosion of the substrate enhances the development of parallel paths of ionic conduction in the coating. AC impedance measurements carried out on polybutadiene-coated steels pretreated by different procedures determine quantitatively the resistance R_p of the conducting paths. (8 refs.)

68683 Chemical studies of polythionic acid stress-corrosion cracking. H.H.Horowitz (Exxon Res. & Engng. Co., Florham Park, NJ, USA).
Corros. Sci. (GB), vol.23, no.4, p.353-62 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
Low temperature stress corrosion cracking of sensitized stainless steel, promoted by aqueous solutions of polythionates $S_xO_6^{2-}$, and related sulfur compounds, particularly thiosulfates, has been a long known problem in the petroleum industry, and more recently has cropped up in the nuclear power industry. Membrane permeation results show that $S_4O_6^{2-}$ and $S_2O_3^{2-}$ do not function simply as sources of sulfide to promote hydrogen permeation and embrittlement. They do promote anodic dissolution also generating an unusual adsorption-related anodic spike in voltammetric scans. The oxidation of iron sulfide scales, said to be the source of the substances in petroleum refineries, has been shown to give rise mostly to Fe_2O_3 and elemental sulfur, with low yields of both $S_4O_6^{2-}$ and $S_2O_3^{2-}$. (10 refs.)

68684 Electrochemical aspects of stress-corrosion cracking of sensitised stainless steels. R.C.Newman, K.Sieradzki (Corrosion Sci. Group, Brookhaven Nat. Lab., Upton, NY, USA).
Corros. Sci. (GB), vol.23, no.4, p.363-78 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
The intergranular stress-corrosion cracking (SCC) of sensitised Type 304 stainless steel has been studied using sodium thiosulphate solutions at room temperature. Electrochemical aspects of the cracking have been examined using a potentiostatic scratching electrode technique applied to simulated grain boundary alloys. These results are compared with the current transients observed after intergranular fracture of embrittled specimens under the electrolyte. Dissolution kinetics within actual propagating cracks have been examined using load modulation. Rapid intergranular failure in a thiosulphate solution can be induced by successive load pulses of extremely short duration. Difficulties in accounting for the SCC velocities by an electrochemical mechanism are discussed. (16 refs.)

68685 Depassivation of iron by straining and by abrasion: an a.c. impedance study. M.Keddam, R.Oltra, J.C.Colson, A.Desestret (CNRS, Phys. des Liquides et Electrochemie, Univ. Pierre et Marie Curie, Paris, France).
Corros. Sci. (GB), vol.23, no.4, p.441-51 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
An a.c. impedance characterization of the mechanical damages caused in situ to the passive film on iron has been performed. Straining at constant rate and abrasion by projecting a suspension of particles are compared. The results are discussed in terms of the classical model involving a sequence of depassivation-repassivation events induced by local breakdown of the film. This model is able to account for the increase of d.c. passive current in both cases. From a.c. data it is concluded that breakdown occurs only under abrasion. This conclusion is corroborated by SEM of the abraded surface and the observation of individual peaks of current on the oscillographic trace. In the case of straining the results are consistent with a large plasticity of the film and no breakdown. A model accounting for the dependence of the d.c. current on the straining rate and for the main impedance features is proposed. (13 refs.)

68686 The leap from conventional to high energy plasma spraying. P.A.Lavin.
Int. J. Refráct. & Hard Met. (GB), vol.2, no.1, p.32-6 (March 1983).
Wear resistant coatings are extensively used to improve the working life of turbine blades and seals in gas turbine engines, to improve wear resistance of components in textile machinery and oil drilling tools, and in the chemical industry where they provide the benefit of both corrosion and wear resistance. The recent developments in the 'low energy' and 'high energy' plasma spraying of tungsten carbide, chromium carbide and chromium oxide-base powders is discussed in the following review. (2 refs.)

68687 Conforma Clad—a new process for customized coatings. M.R.Dustoor.
Int. J. Refract. & Hard Met. (GB), vol.2, no.1, p.37-40 (March 1983).
The Conforma Clad process offers a family of coatings that incorporate a unique blend of properties that have not been hitherto available to the end user. Without sacrificing wear resistance, which is comparable to the best thermal sprayed coatings, it offers low residual porosity together with excellent metallurgical homogeneity and superior bond strengths for coating thicknesses ranging from 0.010 to 0.100 inch. Complex geometries are easily coated without any major limitations on the physical and chemical characteristics of the starting powders which can be selected to provide the desired mix of final properties. (no refs.)

68688 Determination of parameters of electric protection for piping in a piecewise-uniform medium. V.V.Lukovich.
Elektrichestvo (USSR), no.1, p.42-6 (Jan. 1982). In Russian.
For corrosion protection the paper determines the potential and current density on the surface of the piping. Considers cases where the plane of division of the media is parallel to the pipe axis and transverse (or parallel) to the surface of the medium. A solution is obtained in closed form by the boundary integral equations method and quadrature formulae given in the paper. (3 refs.)

68689 'Secondary' heat, and reasons for infringement of the additivity of the rate of removal of metal undergoing electrochemical abrasive polishing. E.S.Varenko.
Elektron. Obrab. Mater. (USSR), no.1, p.39-41 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*
With the aid of representations of moving zones of ionization of a metal behind abrasive grains, an examination is made of the possibility of explaining the influence of operational factors and 'secondary' heat on the productivity of the electrochemical component in the process of electrochemical abrasive polishing. It is shown that an increase in the temperature of the surface layers of the metal during abrasive action can be one of the causes of infringement of the additivity of the rate of metal removal in electrochemical abrasive polishing. (4 refs.) *A.J.B.*

68690 Modification of the corrosion behavior of engineering alloys by ion implantation. C.R.Clayton, Y.F.Wang (State Univ. of New York, Stony Brook, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1752-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Ion implantation is emerging as a powerful and unique approach to corrosion protection. Several studies have demonstrated that the corrosion resistance of a number of ferrous and nonferrous commercial grade engineering alloys can be improved by ion implantation with suitable elements. The authors in which the localized and general corrosion behaviour of bearing steels, stainless steels and aluminum alloys have been significantly improved by ion implantation. The potential industrial application of this technique are considered. (18 refs.)

68691 Formulas of estimation of the critical quenching temperature for the carburization occurring in steels during vacuum oil-quenching. I.Ishigami, E.Tsunasawa, K.Yamanaka (Osaka Prefectural Industrial Res. Inst., Osaka, Japan).
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.314-21 (April 1983). In Japanese.
An equation describing the dependence of the critical quenching temperature upon size and shape of a specimen is developed as follows: $(T_{cf}+t_{qci}-T_b-T_l)(T_{cf}-T_{qci})(V_i/S_i)^{n'}=(T_{cf}+T_{qcj}-T_b-T_l)(T_{cf}-T_{qcj})(V_j/S_j)^{n'}$, where T_{cf} is the finishing temperature of carburizing, T_{qc} the critical quenching temperature, T_b and T_l the boiling temperature and the temperature of oil, respectively, V and S the volume and the surface area of a specimen, respectively and n' the size factor. The suffix i is used to indicate a notation for a reference specimen i and the suffix j for other specimens. Iron specimens were quenched in eleven kinds of oils. T_{qc} was measured, and T_{cf} was calculated by means of the analytical method which had been previously developed. n' was calculated to be 0.287 as a mean value. A regression analysis is carried out for the results and gives the following equations to a 17 mm×25 mm×1.75 mm iron plate used as a reference specimen i ($V_i/S_i=0.875$ mm): $T_{qci}=1377.5+10.81X+0.286T_2$ and $T_{cf}=685.7+0.525T_2$, where T_2(K) is the characteristic temperatures measured at the surface of a silver specimen (ϕ10 mm×30 mm), X(μm) the case depth of the iron plate quenched from 1473K. T_{qc} estimated with this method agrees well with T_{qc} measured for S15C and SUS304. (16 refs.)

68692 Carbide-dispersion carburizing of vanadium steels. A.Chiba (Dept. of Metall., Kumamoto Univ., Kumamoto, Japan), T.Saito, K.Yamaguchi.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.321-8 (April 1983). In Japanese.
The formation of a carbide-dispersed layer (CD layer) by carburizing various vanadium steels at temperatures between 923 and 1273K was studied, and the wear characteristics of these vanadium steels were examined. A CD layer formed by carburizing below A_1 point contains fine platelet V_4C_3 carbides in a ferrite matrix. The crystal orientation relationships between ferrite and V_4C_3 carbide are $(100)(V_4C_23)\|(100)_{\alpha-Fe}$, $[010](V_4C_3)\|[011]_{\alpha-Fe}$ and $[001](V_4C_3)\|[0\bar{1}1]_{\alpha-Fe}$, known as the Baker-Nutting relationship. A CD layer grew in proportion to the square root of time, and the growth rate below A_1 point was explained by a kinetic equation proposed by Wagner for the internal oxidation. The permeability for carbon in Fe-V alloys is expressed as follows; $C_C{}^{(S)}(\mathrm{mass\%}).D_C{}^{\alpha}(\mathrm{m^2.s^{-1}})=1.10\times10^{-3}\exp(-167(\mathrm{kJ.mol^{-1}})/RT)$. Vanadium steels carburized and quench-tempered shows good wear resistance at both low and high sliding speeds, and a steel containing 2.3%V shows better wear resistance than SKD 11 steel. (19 refs.)

68693 Carburizing of dual-phase steel. S.Kamada, K.Hashiura (Dept. of Metallic Engng. for Materials, Akita Univ., Akita, Japan), T.Nishizawa.
J. Jpn. Inst. Met. (Japan), vol.47, no.4, p.359-64 (April 1983). In Japanese.
Carburized parts have been usually quenched twice; from above Ac_3 of the core for grain refinement, then from above Ac_1 for full hardening of the case. This two-step quenching often causes cracking and distortion. The applicability of dual-phase steel to case hardening material has been investigated, because these kinds of steels generally have a fine grain size at high temperatures, so that it has been usual practice to skip the 1st step quenching. 1-2%Si-0.3%Cr-0.01-0.25%C steels were prepared for examining the grain size and the mechanical properties after carburizing at 950°C, quenching being made from 850°C and tempering at 150°C. It has been found that the grain coarsening in the core scarcely occurs if the steel has the two-phase structure of $\alpha+\gamma$ at the carburizing temperature. While the depth and hardness of the case are somewhat reduced by the addition of 2%Si, the core shows the outstanding strength-ductility combination characteristic of dual-phase steel. (11 refs.)

68694 Structural characterization of laser-processed molybdenum steel. P.A.Molian (Dept. of Materials Sci. & Engng., Oregon Graduate Center, Beaverton, OR, USA).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.175-80 (April 1983).
Experiments were performed to study the effects of rapid melting and subsequent quenching on the microstructure and microhardness of laser-processed molybdenum steel. Molybdenum was flame sprayed onto the surface of an AISI 6150 (low alloy) steel substrate to a thickness of 25 μm; the surface of the steel was then melted using a 1200 W continuous wave CO_2 laser to produce an alloy containing 15% Mo to a penetration depth of 200 μm. The microstructure, characterized by scanning and thin foil transmission electron microscopy, consisted of δ ferrite cells with two types of carbide precipitation. Selected area diffraction investigations together with dark field microscopy studies identified these carbides as M_6C and Mo_2C. Fine Mo_2C carbide having the characteristic needle morphology was observed within the ferrite cells. The solidification carbide, namely M_6C, was found to occur in large quantities both at the intercellular boundaries and within the matrix. The matrix M_6C carbide exhibited spherical and rhombohedral morphologies while the cell boundary M_6C carbide had a lamellar morphology. It is proposed that these microstructural features enhanced the microhardness of the laser-alloyed fusion zone to 455 kgf $\mathrm{mm^{-2}}$ (44 HRC). (8 refs.)

68695 The study of variations in stress corrosion cracking velocities in aluminium alloy 7075-T651 by acoustic emission. J.I.Dickson, P.Martin, J.-P.Bailon (Dept. de Genie Metall., Ecole Polytech., Montreal, Quebec, Canada).
Mater. Sci. & Eng. (Switzerland), vol.58, no.2, p.L5-8 (April 1983).
Variations in stress corrosion cracking (SCC) velocities after the introduction of several drops of 3.5% NaCl solution into the crack mouth were followed using acoustic emission. It is suggested that studies of the factors influencing this variation may prove a useful method of studying the processes which control SCC kinetics. (12 refs.)

68696 Relevance of microstructure to stress corrosion cracking in Al-5% Zn and Al-5% Cu alloys containing titanium. M.V.Bhat, K.I.Vasu (Dept. of Metall., Indian Inst. of Sci., Bangalore, India).
Prakt. Metallogr. (Germany), vol.20, no.3, p.130-7 (March 1983).
The importance of microstructure on the stress corrosion cracking (SCC) of materials is assessed from the metallographic studies of fractured wire samples of Al-5% Zn and Al-5% Cu alloys in 1M NaCl solution. Addition of Ti to Al-Zn alloy improves the susceptibility of SCC as a result of improved grain boundary precipitation; whereas addition of Ti to Al-Cu alloy improves the resistance to SCC as a result of general precipitation of second phase and the chilling effect of Ti. Cold-worked alloys have superior SCC resistance over the annealed or aged ones as a result of breaking down of annealed/aged structure and random distribution of second phase particles. (6 refs.)

68697 Initial stages of the oxidation of zirconium studied by X-ray photoelectron spectroscopy and secondary-ion mass spectroscopy. D.P.Valyukhov, M.A.Golubin, D.M.Grebenshchikov, V.I.Shestopalova (Polytech. Inst., Stavropol, USSR).
Sov. Phys.-Solid State (USA), vol.24, no.9, p.1594-5 (Sept. 1982). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.24, no.9, p.2816-18 (Sept. 1982). [received: April 1983]
Both the XPS and SIMS results show that the adsorption of oxygen on zirconium involves the formation of ZrO_2 on the surface to a monolayer coverage. Further oxidation in the bulk occurs via the diffusion of adsorbed oxygen through the ZrO_2 lattice to the metal-oxide interface. (7 refs.)

68698 Computer-assisted d.c. and a.c. techniques in electrochemical investigations of the active-passive transition. B.Elsener, H.Bohni (Inst. of Materials Chem. & Corrosion, Swiss Federal Inst. of Technol., Zurich, Switzerland).
Corros. Sci. (GB), vol.23, no.4, p.341-52 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
The interrupter technique presented, using a computer assisted data acquisition and calculation method, allows the determination of the ohmic potential drop (*IR*-drop) in potentiostatic experiments. The results obtained for the passivation of a 304 stainless steel in low conductivity ethanol/water solutions containing hydrogen chloride show the importance of the accurate correction of the *IR*-drop to calculate the correct kinetic parameters. Impedance measurements give the same values for the ohmic resistance as the computer-assisted interrupter technique. The complex plane plots of the impedance show three capacitive loops before the current density reaches its maximum. (15 refs.)

68699 The use of micro-electrodes in the study of localised corrosion in aluminium alloys. C.D.S.Tuck (Alcan Internat. Ltd., Banbury, England).
Corros. Sci. (GB), vol.23, no.4, p.379-89 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
Micro-electrodes of three types: silver/silver chloride, tin/tin oxide and calomel, were constructed and evaluated aon their usefulness in identifying local anodic and cathodic sites on aluminium wild specimens and an aluminum alloy surface as they were scanned mechanically over a polished surface. The solution environment in which the specimens were placed was shown to have a critical effect on the detectability of local electrode sites and a solution of low conductivity was shown to be essential if the electrodes were microscopic in size. The modified calomel electrode which was able to be used in dry conditions showed the most usefulness in detecting electrode potential differences during a scan although its coarseness was found to be disadvantageous. (16 refs.)

68700 Electrochemical measurements in flowing solutions. B.Poulson (NEI Power Engng. Ltd., Gateshead, England).
Corros. Sci. (GB), vol.23, no.4, p.391-430 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
Fluid flow can influence both the rate and type of corrosion. Despite this most corrosion tests especially those involving electrochemical measurements are carried out under poorly characterized and unrepresentative hydrodynamic conditions. The author reviews the characteristics of existing specimens and then describes the development of a new design. Both the practical, including monitoring, and mechanistic significance of electrochemical measurements in flowing environments are then discussed. (103 refs.)

68701 Electrochemical methods for testing the intergranular corrosion susceptibility of stainless steels. P.Aaltonen, I.Aho-Mantila, H.Hanninen (Metals Lab., Tech. Res. Centre of Finland, Espoo, Finland).
Corros. Sci. (GB), vol.23, no.4, p.431-40 (1983). (Meeting on Electrochemical Techniques in Corrosion Testing and Research, Manchester, England, 4-6 Jan. 1982).
In addition to the standardized intergranular corrosion testing methods to detect sensitization in austenitic stainless steels, electrochemical test methods, i.e. the potentiokinetic reactivation test (EPR) and the anodic polarization,

and constant potential etching methods in perhcloric acid solution containing sodium chloride, have been developed. The results of these electrochemical measurements are compared with those obtained from copper sulfate-sulfuric acid tests. (18 refs.)

68702 Electrochemical evaluation of hot corrosion resistance of metallic materials. U.Ducati, G.Lecis Coccia, G.Caironi (Dept. of Appl. Phys. Chem., Politecnico di Milano, Milan, Italy).
Mater. Chem. & Phys. (Switzerland), vol.8, no.2, p.135-45 (Feb. 1983).
A fast, effective method for the evaluation of hot corrosion resistance of metallic materials is presented. This method is based on the extension to high temperature field of electrochemical techniques for the study of corrosion in aqueous environments. Its results are consistent with those obtainable by thermogravimetric techniques or by bench testing. An application example is given. (3 refs.)

68703 Edge effects in composites by moire interferometry. R.Czarnek (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), D.Post, C.Herakovich.
Exp. Tech. (USA), vol.7, no.1, p.18-21 (Jan. 1983).
Many aspects of the physical behavior of composite materials can be observed and quantified by moire interferomety. With the very high sensitivity of moire interferometry, the experiments are conducted at a low average strain and stress level, assuring linear and elastic behavior of the composite material. Sensitivity corresponding to moire with 2450 l/mm (62,230 l/in.) was achieved, namely 0.408 μm per fringe (16.1 μin./fringe). The displacement field on the specimen face and edge was observed simultaneously. Good fringe definition was achieved, even though the specimen was only 1 mm thick and the gradients were high. Use of a carrier pattern and optical filtering were effective even for these conditions. The existence of edge effects and dramatic displacement gradients were corroborated for angle-ply composite laminates. (6 refs.)

68704 The Iosipescu shear test as applied to composite materials. D.E.Walrath, D.F.Adams (Dept. of Mech. Engng., Univ. of Wyoming, Laramie, WY, USA).
Exp. Mech. (USA), vol.23, no.1, p.105-10 (March 1983).
A history of the Iosipescu shear test as applied to composite materials is presented along with a description of the test fixture and specimen design. Iosipescu's shear test is compared to similar test techniques, including the asymmetrical four-point bending (AFPB) test. Finally, in-plane and through-the-thickness shear properties measured using the Iosipescu shear tests are presented for a variety of materials, including a unidirectional graphite/epoxy, random and continuous-fiber sheet molding compounds, and two polymer materials. (39 refs.)

68705 Spatial resolution in industrial tomography. Be-shan Chiang, S.R.Gautam, F.F.Hopkins, I.L.Morgan (Scientific Measurement Systems Inc., Austin, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1671-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The parametric dependence of spatial resolution on tomographic parameters is investigated. The influence of Computerized Tomographic parameters, such as the number of angular views, ray spacings in a fan beam, the degree of collimation, and the magnitude of the object opacity, on the spatial resolution is studied. The research was carried out using a specially designed resolution phantom. The phantom was designed to incorporate features of varying sizes, shapes and mass densities. An index of resolution is defined to quantatively express the results of this study. (23 refs.)

68706 Compton interaction tomography. I. Feasibility studies for applications in earthquake engineering. S.R.Gautam, F.F.Hopkins, R.Klinksiek, I.L.Morgan (Scientific Measurement Systems Inc., Austin, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1680-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Feasibility of applying Compton Interaction Tomographic (CIT) processes for nondestructive testing of massive extended systems is studied on a laboratory prototype device. The principles of Compton interaction between electromagnetic radiation and matter underlie the technique. Experimental studies are conducted to detect features such as iron rebars and air voids contained in a concrete medium. Computer simulation studies have been made to supplement experimental results. (2 refs.)

68707 An optical emission spectrographic method for the determination of niobium in steels. S.V.Grampurohit, S.S.Biswas, V.S.Dixit (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.978-81 (Dec. 1982). [received: April 1983]
An optical emission spectrographic method for the determination of niobium in steels in the range from 0.1 to 2% Nb is described. The sample is converted to oxide through acid dissolution and mixed with buffer and graphite in the ratio 1:2. The mixture is subjected to DC arc excitation using graphite electrodes. The resulting spectrum is recorded on a Kodak SA-1 emulsion using a Hilger large quartz spectrograph. A pre-arc period of 30 s and an exposure of 30 s are adopted. Two lines of niobium at 2583.986 and 2590.944 Å are selected as analysis lines while the iron line at 2587.999 Å is used as internal standard line. The method shows a mean standard deviation of ±15%. (5 refs.)

68708 A modulus method of determining the type of rolling texture in sheets of hexagonal metals. V.S.Ivanii, N.V.Ivanii, V.S.Kshnyalin (Makarenko Teacher-Training Inst., Sumi, USSR).
Ind. Lab. (USA), vol.48, no.7, p.662-7 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.28-31 (July 1982). [received: March 1983]
The relationship between the texture and the anisotropy in the elastic properties is considered in a simplified scheme for representing the orientation distribution of hexagonal crystals, and a method is proposed of determining the type and character of the texture dispersion by measuring the anisotropy in the elastic modulus in the plane of a sheet of the material. The results show that the method is particularly effective for routine monitoring of sheet texture for a particular grade of metal in order to predict the anisotropy in the physicochemical properties of the semifinished product and to choose the optimum way of using this anisotropy to improve the working characteristics. (8 refs.)

68709 Scope for monitoring the thermomechanical hardening of steel from the martensite X-ray line intensity and shape. L.M.Kaputkina, S.D.Prokoshkin, V.E.Mozzhukhin, L.A.Zav'yalova, N.A.Nikishov (Moscow Inst. of Steel & Alloys, Moscow, USSR).
Ind. Lab. (USA), vol.48, no.7, p.667-74 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.32-8 (July 1982). [received: March 1983]
Considers the scope for using X-ray texture analysis of the martensite, where one employs the effects of the texture in the initial austenite on the fairly strong lines of the martensite at low indices, as are usually examined in analyzing the lattice. (11 refs.)

68710 Diffractometer determination of the fine-structure parameters in surface layers of a material. N.L.Baturinskaya, N.A.Kal'chuk, V.G.Chernyi (Inst. of Casting Problems, Acad. of Sci., Kiev, Ukrainian SSR).
Ind. Lab. (USA), vol.48, no.7, p.674-6 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.38-40 (July 1982). [received: March 1983]
The following aspects of the glancing beam method have been examined: a) to develop an analogous method for a diffractometer (with ionization or scintillation recording); b) to estimate the fine-structure parameters (size of the coherent-scattering regions and the lattice microdistortion) at depths of 0.1-10 μm; and c) to compare the results obtained in this way with those from the standard techniques. The object was an Fe-Cr-Mn-C alloy based on iron with an FCC lattice deformed by friction. The results indicate that the glancing-beam method as applied to an X-ray diffractometer is reliable and can be used to examine the structures of thin surface layers (<1 μm) and to examine the changes in characteristics of the surface layer in the range 0.1-10 μm. (6 refs.)

68711 Energy factors of build-up of X-irradiation. A.P.Shpagin, I.M.Rubinovich (Tomsk Polytech. Inst., Tomsk, USSR).
Ind. Lab. (USA), vol.48, no.7, p.690-3 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.49-51 (July 1982). [received: March 1983]
The energy factors of build-up behind an iron layer were calculated by the Monte Carlo method. A planar monodirectional and monoenergetic source was selected. Incoherent scattering and the photoelectric effect were taken into account in the modelling of the trajectories of gamma quanta. For the given set of the trajectories, the spectra were obtained immediately behind 12 thicknesses of the absorber from 3 mm to 8 cm. To increase the statistical accuracy of the calculations, absorption was averaged out analytically and an exponential transformation was carried out. The trajectory of the gamma quantum was followed until its energy dropped below 8 keV. The statistical accuracy of the calculations of the energy factor of build-up was $\sim$10%. (7 refs.)

68712 A spectroscopic method of determination of the perfection of the crystal structure of the surface of silicon sheets. L.N.Didrikil' (Sci.-Res. Inst. of the Watch Industry, Uglich, USSR).
Ind. Lab. (USA), vol.48, no.7, p.694-6 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.51-3 (July 1982). [received: March 1983]
The author describes a rapid nondestructive method of inspection of the perfection of the crystal structure of the surface of semiconductors using light reflection. The reflection spectra of silicon sheets treated by various methods are shown. Reflection was measured in an SF-26 spectrometer with a reflection attachment. The angle of incidence of the beam on the specimen was 10°. The spectra characterize the degree of perfection of the crystal structure of the surface. (2 refs.)

68713 Use of domestic ultrasonic inspection equipment for thick-rolled sheet. N.N.Timoshenko, V.M.Verevkin, V.A.Kashirin.
Ind. Lab. (USA), vol.48, no.7, p.697-8 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.53-4 (July 1982). [received: March 1983]
High sensitivity and the possibility of automating the ultrasonic inspection process have been combined in the through-echo flaw-detection method. In it the ultrasonic transducers are positioned in exactly the same way with respect to the object being inspected as for the shadow method, i.e., on either side. Thus in one equipment the shadow and through-echo methods can be combined. (6 refs.)

68714 Use of vacuum metallography methods for evaluating the effectiveness of materials with protective coatings. L.B.Getsov, A.I.Rybnikov, E.Ya.Ol'shanskaya.
Ind. Lab. (USA), vol.48, no.7, p.719-23 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.74-7 (July 1982). [received: March 1983]
Questions of evaluating the effectiveness of coatings under conditions of static and thermocyclic loads with the use of vacuum metallography methods are considered. Methods of tensile testing and thermal fatique testing are described. (7 refs.)

68715 A statistical method of determining the early signs of necking. M.A.Kibardin (Shadrinsk Teaching Inst., USSR).
Ind. Lab. (USA), vol.48, no.7, p.723-5 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.77-8 (July 1982). [received: March 1983]
The proposed method of determining the early signs of necking in a sample based on the start of a steady increase in the coefficient of mutual correlation of series of pairs of units of the deformed field with an increase in the degree of macrodeformation is based on the method of coordinate networks. The investigations were made on AD1-M aluminium. The samples with a gauge length of 60×22×3 mm were cut from sheet in the rolling direction. Before testing they were annealed at 480°C for 3 h and then furnace cooled to room temperature. An orthogonal network with a base of 1 mm was applied to the working surface of the sample on a UIM-21 microscope with a diamond cutter with an accuracy of ±2 μm. (4 refs.)

68716 A unit for investigating microplastic deformations. S.A.Aleksandrov, O.V.Zernov, V.V.Ostashev, V.V.Shevel'kov (Kalinin Leningrad Polytech. Inst., Kalinin, USSR).
Ind. Lab. (USA), vol.48, no.7, p.730-1 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.81-3 (July 1982). [received: March 1983]
A test unit is described for automatically recording the accumulation of microplastic deformations with output of the information in a form convenient for direct entry into the computer. Operator participation in the measurements is completely eliminated. (no refs.)

68717 Heating unit for mechanical testing of heat-resistant alloys at high temperatures. F.Z.Utyashev, B.V.Rodionov, R.G.Baimurzin (Ufa Aviation Inst., Ufa, USSR).
Ind. Lab. (USA), vol.48, no.7, p.731-4 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.83-4 (July 1982). [received: March 1983]
A heating unit is described which can be used along with devices for mechanical testing of heat-resistant materials under superplasticity conditions. The unit consists of a 'Sandugach' PST-10-22.0 miniature semiconductor frequency converter; a high-temperature furnace chamber; an automatic control system for measuring and regulating the test temperature; and a loading device. (no refs.)

68718 Automated testing systems with hydraulic force excitation. Yu.E.Tyablikov, O.A.Levin.
Ind. Lab. (USA), vol.48, no.7 (July 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.7, p.84-92 734-43 (July 1982). [received: March 1983]
The authors review the present state-of-the-art in computer-controlled test systems and conclude that they make it possible to employ a systematic approach to the automation of experiments in the analysis of the strength of structures on a single element basis. Taking into account the amplitude-frequency characteristics and metrological parameters of testing machines, the problems associated with the examination of the mechanical properties of

materials, experimental and numerical determination of nonuniform stress states in zones of stress raisers, and the problems of tests on models and components of machines and of the estimation of the service life of structures can be solved comprehensively. (18 refs.)

68719 Toward a pure shear specimen for K_{IIc} determination. L.Banks-Sills, M.Arcan (Dept. of Solid Mech., Tel Aviv Univ., Ramat Aviv, Israel), H.D.Bui.
Int. J. Fract. (Netherlands), vol.22, no.1, p.R9-14 (May 1983).
Reports on a newly developed specimen which is proposed for use in accurately measuring K_{IIc}. The specimen presented is a modification of one which was developed for other purposes (Arcan et al., 1978), in which by loading in only one direction it is possible to obtain a narrow region of nearly uniform pure shear. (8 refs.)

68720 Fracture toughness tests on an aluminium alloy using a chevron notch bend specimen. L.P.Pook (Nat. Engng. Lab., Glasgow, Scotland).
Int. J. Fract. (Netherlands), vol.22, no.1, p.R21-3 (May 1983).
The results of experiments on chevron notch specimens are reported. It was concluded that for a material with a rising crack growth resistance curve, K_{Ic} could not be measured using chevron notch specimens. (5 refs.)

68721 A facility for precise measurement of mechanical properties at elevated temperatures. E.T.C.Ho (Ontario Hydro, Toronto, Ontario, Canada), S.R.MacEwen.
J. Met. (USA), vol.35, no.2, p.25-9 (Feb. 1983).
A test facility consisting of an environmental chamber, a remote extensometer, and a miniature three-zone furnace has been developed for use with a computerized model 1116 Instron. Experiments can be done in either vacuum or inert gas. The temperature of the specimen is controlled from three 125-μm-diameter, bare-wire, type K thermocouples which are spot welded to the sample. Over the 2.5-cm-gage length, the temperature is constant to within 1K, and there is negligible control ripple. A remote extensometer, which attaches to the shoulders of the sample, allows the strain to be measured continuously using a standard, clip-on strain gage. Examples of tensile tests, creep tests, stress-drop tests, and stress relaxation, using Zr-2.5 wt.% Nb specimens at temperatures in the vicinity of 0.5 T_m, are presented. (8 refs.)

68722 A plane strain tensile apparatus. H.Sang (Alcan Internat. Ltd., Kingston, Ontario, Canada), Y.Nishikawa.
J. Met. (USA), vol.35, no.2, p.30-3 (Feb. 1983).
A simple clip-on apparatus has been designed to deform a modified sheet tensile specimen in a state of plane strain. The apparatus consists of a sprung clamp having four knife edges to prevent specimen edge pull-in. Both the plane strain limit strain and fracture strain are obtained from measurements on the fractured sample. Results compare favorably with previously published data. In addition, the apparatus has been used to measure the plane strain formability parameters at non-ambient temperatures. (9 refs.)

68723 Predicting heat-affected zone hardness by the weld test method. M.J.Bibby, Lan-meng Chong, Goldak J.A. (Dept. of Mech. Engng., Carleton Univ., Ottawa, Canada).
J. Test. & Eval. (USA), vol.11, no.2, p.126-33 (March 1983).
The 'weld test method' of predicting heat-affected zone (HAZ) hardness first suggested by Stout et al. (1945) is further developed in this investigation. The contemporary heat flow analysis of Adams (1958) and Jhaveri et al. (1962), and conclusions from the recent particularly relevant hardness-heat flow investigation of Graville (1973) are incorporated into the model. A 'welding hardness diagram' is suggested to represent to the test data and to simplify the task of predicting HAZ hardness. Experimental hardness results are compared to predicted values for a relatively wide range of carbon-manganese and low alloy structural steels in support of the welding hardness diagram approach. The relative merits of this procedure compared to the recent mathematical methods suggested by Bastien et al. (1970) and by Arata et al. (1972) for predicting HAZ hardness are discussed. (20 refs.)

68724 Confidence limits of stress values measured by X-ray diffraction. M.Kurita (Dept. of Mech. Engng., Technol. Univ. of Nagaoka, Nagaoka, Japan).
J. Test. & Eval. (USA), vol.11, no.2, p.143-9 (March 1983).
The confidence limits of stress values measured by X-ray diffraction are usually determined from the equation of the t distribution for the linear regression analysis. Experimentation has shown that not all of the four assumptions on which the equation is based hold for X-ray stress measurement. X-ray residual stress measurement on a quenched structural steel was repeated 65 times. A slight failure of the assumption of linearity of the $\sin^2\psi$ diagram gives confidence limits of the stress determined from the equation 1.5 to 6 times larger than the actual values depending on the preset times used. However, the confidence limits of the stress determined from the equation derived analytically from X-ray counting statistics agree very closely with the actual values. The standard error of the confidence limits determined from this equation is much smaller than that determined from the equation of the t distribution by a factor of $^1/_{15}$ to $^1/_{67}$. (11 refs.)

68725 Accuracy and precision of crack length measurements using a compliance technique. R.L.Hewitt (Structures & Materials Lab., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
J. Test. & Eval. (USA), vol.11, no.2, p.150-5 (March 1983).
A compliance crack measurement technique has been implemented in a computer-controlled fatigue crack growth rate test written to conform to the ASTM test for constant-load-amplitude fatigue crack growth rates above 10^{-8} m/cycle (E647). The use of a 'correction' factor in the compliance expression is discussed and relevant details of the computer implementation are provided. Possible sources of error in the technique have been investigated and the relative precision and absolute accuracy determined using 12.6-mm-thick compact tension specimens of 2024 T351 (unified numbering system [UNS] A92024) aluminum having widths of 51 mm. The relative precision of individual measurements using standard fixtures was found to be about 0.05 mm, but this can be reduced to as little as 0.01 mm by averaging over 20 measurements. For most crack lengths, the calculated lengths were within 0.25 mm of the average physical crack lengths measured from profiles on fractured specimens. (4 refs.)

68726 High pressure fatigue testing with results for tubing and fittings. W.N.Findley, R.M.Reed (Div. of Engng., Brown Univ., Providence, RI, USA).
J. Test. & Eval. (USA), vol.11, no.2, p.156-9 (March 1983).
Means are described for raising by a factor of about three the allowable cyclic pressure provided by a high pressure fatigue machine for fatigue testing of thick-walled tubes. Fatigue test results are given for 7.9- and 6.4-mm high pressure tubing of 316 stainless steel, crosses, tees, and seals. (4 refs.)

68727 Analysis of surface states by the Kirlian effect.
Mes. Regul. Autom. (France), vol.48, no.3, p.63, 65-6 (7 March 1983). In French.
Nondestructive testing by recording of surface discharges in a strong alternating electric field is described. In one variant, the sample is placed between a metallic electrode and an insulating Mylar sheet in contact with a transparent conductive electrode of glass coated with a thin layer of tin oxide, through which the luminous discharges are photographed by a Polaroid camera. A direct-recording alternative uses the metallic sample itself as the earth electrode, and the photosensitive film is placed between it and the HT electrode. The physical principle of the method is explained. A test piece with a tapered rectangular depression has been used at the University of California to measure the relationship between thickness of the air gap and the onset of the luminous discharge. The method's potential for inspection of surface conditions after mechanical or thermal treatment is assessed. (no refs.) *M.B.D.*

68728 Automated inspection of corroded steel structures. A.Singh, R.McClintock (Southwest Res. Inst, San Antonio, TX, USA), T.W.Rudwick, R.L.Brackett.
Mater. Eval. (USA), vol.41, no.5, p.568-70 (April 1982). [received: May 1983]
Deterioration caused by corrosion of steel can result in catastrophic failures of waterfront facilities and other offshore structures. Inspection of corroded steel structures is largely limited to visual examination. However, this is not a reliable nondestructive method for thickness measurement because it is limited to assessing surface damage. A novel ultrasonic concept has been developed and integrated into an automated scanning system. This concept uses a focused ultrasonic transducer centered over a corroded pit so that the pit acts as an acoustic lens. Special transducer modification and pattern analysis techniques have been developed to overcome the effects of spurious signals. Scanning of the corroded area, alignment of the focused transducer over the pits, and acquisition and processing of the signals to determine the thickness of corroded steel are performed by the computer-controlled system. An average thickness measurement error of only four percent was achieved using this system. (3 refs.)

68729 A proposed ultrasonic inspection technique for offshore structures. M.D.Fuller, J.B.Nestleroth, J.L.Rose (Dept. of Mech. Engng., Drexel Univ., Philadelphia, PA, USA).
Mater. Eval. (USA), vol.41, no.5, p.571-8 (April 1982). [received: May 1983]
The need for nondestructive evaluation (NDE) procedures for tabular joints in offshore structures is emphasized by every platform collapse. A new microprocessor-based ultrasonic inspection technique for tubular joints has been devised and preliminary tests conducted. The inspection concepts and the sensitivity of the technique to damage has been evaluated utilizing a 1/3 scale structural K-joint. The inspection concepts are discussed; in addition, the results of the 1/3 scale K-joint fatigue test are presented. Additional laboratory experiments were conducted to determine the effects of a marine environment and other limiting conditions on the sensitivity and feasibility of the technique. These results are also discussed. (11 refs.)

68730 Method for measuring transducer movement during underwater ultrasonic evaluation of weld flaws. W.S.Burkle (Phillips Petroleum Co., Bartlesville, OK, USA).
Mater. Eval. (USA), vol.41, no.5, p.579-81 (April 1982). [received: May 1983]
Underwater ultrasonic weld testing is considerably more difficult than testing work conducted on the surface. A difficulty particularly present during underwater ultrasonic testing (UT) is the ability to accurately measure flaw dimensions using beam boundary intercept and other common defect-sizing techniques. Because flaw measurement constitutes a considerable portion of the data needed for critical evaluation of weld acceptability, accuracy is of the utmost importance. The author discusses a method for improving flaw measurement accuracy utilizing ultrasonic echo-ranging techniques that employ a separate transducer and test instrument to monitor probe movement. (no refs.)

68731 The magfoil method. K.G.Walther (Henrichs & Walther GmbH, Bocholt, Germany).
Mater. Eval. (USA), vol.41, no.5, p.582-5 (April 1982). [received: May 1983]
The magnetographic system represents a new method for underwater weld inspection. The diver's function is relatively simple and can be carried out by non-NDE qualified personnel. The system provides objective test results that are distinguished by reliability and reproducibility. These results can be stored and compared with results obtained in earlier inspections. (no refs.)

68732 Magnetographic weld inspection system for underwater installations. W.Stumm (Inst. Dr. Forster, Reutlingen, Germany).
Mater. Eval. (USA), vol.41, no.5, p.586-8 (April 1982). [received: May 1983]
A new underwater tool for magnetic inspection of welds is described. This tool enables separation of a diver's work and the evaluation procedure. The results from the inspected weld areas are shown in a two-dimensional C-scan. (no refs.)

68733 Determination of fatigue strength of plastics according to up-and-down method. M.Nowak (Politech. Wroclawska, Wroclaw, Poland).
Mech. Teor. & Stosow. (Poland), vol.19, no.2, p.301-13 (1981). In Polish.
The statistical analysis of 60 up-and-down method diagrams was carried out to find the minimum number of samples required for determination of the fatigue strength of plastics. Based on sequential analysis, evidence is given that if the value of the cumulative function is not greater than 3 per cent of the size of set taken as parent population, then the determination of fatigue strength can be carried out for a number of samples not less than 22. The applicability of a modified up-and-down method for determination of the fatigue limit is verified. It is found that in this pattern of calculation the number of samples may be reduced by 10 per cent. As the experimental set of diagrams represents a relatively wide class of plastics and test parameters, the applicability of the conclusions to other materials with dispersion within the limits of the tested set, was found possible. (30 refs.)

68734 Delineation of the microstructure of high alloy CrNi, CrNiW and CrNiCoW steels by deep etching. G.Herbsleb, P.Schwaab (Mannesmann Forschungsinst. GmbH, Duisburg, Germany).
Prakt. Metallogr. (Germany), vol.20, no.2, p.53-63 (Feb. 1983). In English, German.
Tests were carried out on very complex high alloy CrNi, CrNiW and CrNiCoW materials. For the majority of the investigated materials etching at room temperature in alcoholic HCl (9 parts by volume methanol to 1 part HCl) in the active region (U_H=0.250 V, etch time approx. 60 min.) was suitable to reveal the spatial microstructure. For two materials containing Co and W, the latter in varying amounts, there were difficulties due to formation of a protective layer. No satisfactory deep etching method was found for the material with low W content even in other electrolytes (HCl solutions of various concentrations and at various temperatures) by holding potentiostatically in the active region or in HF without an externally applied current.

Surprisingly the structure of the Co and W containing materials with higher W content could be revealed in aqueous solutions of HCl. (7 refs.)

68735 Applications of analytical electron microscope in metal structure analysis. Energy dispersive spectroscopy (EDS). K.Uehara, Y.Takano (Nagasaki Tech. Inst., Mitsubishi Heavy Industries Ltd., Nagasaki, Japan).
Prakt. Metallogr. (Germany), vol.20, no.2, p.74-84 (Feb. 1983). In English, German.
Presents the results of extraction replica analysis on the metal structures of several types of routinely-used high temperature steel, and discusses the usefulness of the analytical electron microscope. (no refs.)

68736 Metallographic characterization of PM material. W.J.Huppmann, K.Dalal (Sintermetallwerk Krebsoge GmbH, Radevormwald, Germany), P.Wellner, G.Elssner.
Powder Metall. (GB), vol.26, no.1, p.23-30 (1983).
A systematic characterization is made of the most important PM materials which are used in the production of sintered parts. For this purpose both literature data and new experimental results are used. The description of the metallographic preparation techniques is followed by three sections on: (i) characterization of the porosity classes of sintered materials; (ii) characterization of surface treatments—steam treatment, galvanizing, and mechanical plating; and (iii) characterization of case hardened sintered steels. (8 refs.)

68737 Reappraisal of results of transverse rupture tests for hardmetals. T.J.Griffiths (Dept. of Mech. & Production Engng., Polytech. of Wales, Pontypridd, Wales).
Powder Metall. (GB), vol.26, no.1, p.42-3 (1983).
An equation is presented for calculating strength values from transfer rupture tests that gives better agreement between results using different test pieces. Allowances are made for the effect of contact stresses under the point of application of the load. (2 refs.)

68738 Fatigue crack advance presumably detected by acoustic emission signals. C.J.Kim, Guo-zhi Lu, J.Weertman (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA).
Scr. Metall. (USA), vol.17, no.3, p.359-64 (March 1983).
An acoustic emission (AE) technique was used to check the predictions of the authors' fatigue crack growth theory. The study shows that the predictions of the theory seem to be in agreement with the experimental results. In fourth power type law material the fatigue crack extension AE signal appears when the stress reaches its maximum value in a load cycle. On the other hand, in a second power type law material (maraging 300 steel) the crack extension AE signal occurs when the stress is still well below its maximum value. (6 refs.)

68739 Comments on: deformation twins in punched specimens of a 321 steel. L.E.Murr (Oregon Graduate Center, Beaverton, OR, USA).
Scr. Metall. (USA), vol.17, no.3, p.423-4 (March 1983).
Comments are made on a paper by Newcomb and Stobbs (see ibid., vol.16, p.1153, 1982) in which they conclude that the punching process effectively focuses a shock wave at the centre of the disc where it will be subsequently thinned. They also assert that spark cut, rather than punched discs should be used in TEM studies of the deformation microstructure and transformation behaviour. The present authors point out that disc punching of thin sheet specimens for TEM analysis and diagnosis certainly should not be a deformation process, and that the formation of deformation twins is indicative of improper punching technique. (5 refs.)

68740 Deformation in punched specimens of type 304 stainless steel. M.E.Kassner (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Scr. Metall. (USA), vol.17, no.3, p.425-6 (March 1983).
In a recent paper on deformation twins in punched specimens of a 321 steel (see ibid., vol.16, p.1153, 1982) Newcomb and Stobbs examined the microstructure of spark-cut and mechanically punched disks under the transmission electron microscope (TEM). They concluded that the mechanical punching of disk produced plastic deformation at the center of the disk, where it was subsequently electrochemically thinned. The plastic deformation was evidenced by profuse mechanical microtwinning. The present author presents the results of an analogous comparison study on 304 stainless steel spark-cut/punched disks. Because the mechanical properties of 304 and 321 stainless steels are essentially equivalent, the results described here place the findings of Newcomb and Stobbs for 321 stainless steel in question. (5 refs.)

68741 Enhancing the information yield of the ultrasonic inspection of welded joints with a permanent backing ring. V.V.Gorskii, V.T.Pronyakin, G.V.Dubinin.
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.594-7 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.19-22 (Aug. 1982). [received: April 1983]
A procedure is described for enhancing the information yield of the ultrasonic inspection of welded joints with a permanent backing ring in testpieces having a tubular configuration with a thickness of 2-5 mm, namely by recording separately the reflected pulses from flaws and from the sidewalls of the backing ring. It is shown that the size of weld flaws and the degree of fusion of the backing ring can be determined from the ratio of the amplitudes of these pulses. Focusing combination double transceiver probe configurations are given, along with a block diagram of a flaw detector with a tracking gate pulse, which is capable of detecting flaws with diameters of 0.3 mm or more, nonbonds with a height of 0.15 mm or more, and the displacement of the weld relative to the joint. (7 refs.)

68742 Analytical method of solving one class of nonlinear problems in electromagnetic inspection of ferromagnetic products. A.N.Plakhotnyuk, A.S.Trofimov (Krasnoyarsk Polytech. Inst., Krasnoyarsk, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.604-12 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.29-39 (Aug. 1982). [received: April 1983]
An approximate analytical method is proposed for solving one-dimensional (in space) nonlinear problems of electromagnetic inspection which uses data on the boundary conditions, taking also into account electrical conductivity and hysteresis in the ferromagnetic object. The effectiveness of this method is demonstrated by a comparison of theoretical and experimental data on steady periodic magnetization of a strip (cylinder) in a strong longitudinal magnetic field. The oscillatory character of higher harmonics of the electric field intensity at the surface of such an object is also discussed. (20 refs.)

68743 Magnetoelastoacoustic method of nondestructive inspection of heat-treatment quality for steels. L.S.Pravdin (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.629-32 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.57-61 (Aug. 1982). [received: April 1983]
The dependence of the alternating magnetoelastic induction on the hardness of steel is examined on the basis of specimens of grades 20, 35, 45, U8, 30KhGS, 40Kh, 45KhNMF, and KhVG steel which have been heat treated over a wide range of tempering temperatures. This relation is found to be unambiguous for all grades of steel. For ensuring a high sensitivity over a wide range of hardness variation, it is proposed that measurements be made at two levels of magnetic field intensity. Tests performed on commercial production samples, for certification of this method, have yielded a higher than 0.9 çoefficient of correlation between measured signal and hardness. (7 refs.)

68744 Visualization of the results of flaw detection on a color-television screen. V.S.Kozlov, N.I.Kuznetsov, Yu.Sh.Golant (Belorussian Polytech. Inst., Belorussian SSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.633-40 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.61-9 (Aug. 1982). [received: April 1983]
Color video-control devices of special construction can be used in nondestructive testing, X-ray analysis, medicine, and wherever radio-control devices with black and white pictures are employed at the present time. The authors derive the equations for colorimetric calculations, which may find an important place in color video-control devices and television handbooks. Theoretical aspects of the coloring of a black and white picture are considered. A color-signal generator is developed and constructed which is an attachment to a color television set, and enables the black and white image to be colored to provide greater contrast for discerning it with a quantitative estimate of its level. In effect, a 'three-dimensional oscilloscope' is produced where the third measurement is represented by the color. New principles are employed in the construction which differ from those described in the literature. For example, the problem of eliminating color frames in the image (called false color tones) is solved in an original manner. (6 refs.)

68745 Alternating magnetization modes in the quality control of hardened and tempered articles from the value of the residual magnetic induction. M.N.Mikheev, G.V.Bida, T.P.Tsar'kova, V.N.Kostin (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.641-50 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.69-79 (Aug. 1982). [received: April 1983]
Alternating magnetization modes up to certain values of the induction and the same external magnetic field, used in the quality control of tempering from the value of the residual induction B_d of the article, are considered. In the case of an open magnetic circuit a relation is given which connects the value of B_d with the magnetic characteristics of the material, the shape factor, and the external alternating magnetizing field. For a closed circuit of the attached electromagnet an expression is obtained relating the value of the output signal I_{ro} proportional to B_d, and the parameters of the magnetic circuit and the characteristics of the material. The variation of the magnetic properties with tempering temperature, defining the relations $B_d(T_t)$ and $I_{ro}(T_t)$ is investigated for a number of grades of steel. (17 refs.)

68746 Magnetic inspection of the mechanical properties of steel pipes. O.S.Konovalov, A.S.Golovko, V.I.Roitman (Nikopol'sk Southern Pipe Plant, USSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.654-6 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.82-4 (Aug. 1982). [received: April 1983]
The magnetic inspection of the mechanical properties of steel compoennts, especially pipes, is based on the correlation between the magnetic and mechanical parameters of the material of the components. Devices measuring one characteristic (coercive force H_c or remanent magnetic flux density Br) are used in most cases. The ferroprobe coercive force meters KIFM-1, KF-1, or similar devices in which the measuring signal is represented by demagnetizing current I_d, are used most extensively. (3 refs.)

68747 Classification of defects in welded joints on the basis of radiometric inspection results. A.A.Adamenko, V.G.Demidko (E.O. Paton Welding Inst., Acad. of Sci., Kiev, Ukrainian SSR).
Sov. J. Nondestr. Test. (USA), vol.18, no.8, p.664-6 (Aug. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.8, p.93-4 (Aug. 1982). [received: April 1983]
The analytical equations for the output signal of a square radiometric detector are derived in relation to the parameters which charcterize the degree of defectiveness of the welded joint. An algorithm for classification of welded joints on the basis of COMECON standards using the results of radiometric inspection is proposed. (7 refs.)

68748 A large-scale impact spalling test. R.Blickensderfer, J.H.Tylczak (Albany Res. Center, Bur. of Mines, US Dept. of the Interior, Albany, OR, USA).
Wear (Switzerland), vol.84, no.3, p.361-73 (1 Feb. 1983).
A unique test apparatus is described that effectively produces spalling on wear-resistant alloys and can be used to study the causes of spalling. The work was conducted as part of an effort to minimize the consumption of strategic materials used during the mining and processing of minerals. The test utilizes balls 75 mm in diameter made of the test alloys, which are dropped a distance of 3.5 m. Multiple impacts over a range of energy are produced between the balls. The unique design of the test apparatus provides a multiplying effect that results in 30000 or more total impacts per hour on 20 or so test alloys. The four major types of failure that were observed on 22 commercial and experimental alloys that received up to 300000 impacts are discussed. (6 refs.)

68749 Calculational principles for the analysis of ODF reproducibility from pole figures. J.Pospiech (Inst. for Metal Res., Polish Acad. of Sci., Krakow, Poland).
Z. Metallkd. (Germany), vol.74, no.4, p.221-5 (April 1983).
A formalism for the analysis of the reproducibility of the orientation distribution function (ODF) from pole figures has been derived. This formalism is general and it specifies the conditions which any reproduction method should satisfy. Basing on the obtained results the known calculation methods are discussed. (17 refs.)

68750 Impact testing of fibre reinforced composite materials. J.Harding, L.M.Welsh.
Report OUEL-1415/82, Univ. Oxford, England (1982), 18 pp.
Techniques for determining the mechanical properties of composite materials under tensile impact loading are briefly reviewed and the difficulties encountered are discussed. A new method, based on the standard tensile version of the slit Hopkinson's pressure bar (SHPB) apparatus, is described and the validity of data obtained by this means is established. Dynamic stress-strain curves for unidirectionally reinforced CFRP are presented and compared with those determined at lower rates. The limitations of the testing technique are discussed. (15 refs.)

68751 Defect sizing using the Time of Flight Technique on the RNL RSV plate. L.N.J.Poulter, A.Rogerson.
Report NR-R-790(R), UKAEA, Risley, Lancs., England (Dec. 1982), 24 pp. Available from HMSO, London, England.
An ultrasonic inspection system employing the time of flight technique (TOFT) has been developed at RNL for sizing defects in thick section clad plate. Three dimensional defect sizing is achieved through SAFT processing of TOFT data gathered in two orthogonal scans over the identified defect. A description is given of the complete system including data display facilities and analysis procedures. Results of the application of the system to twenty defects in the RNL RSV plate are discussed in terms of the influence of various factors which could influence sizing accuracy. (11 refs.)

68752 Cold stamping by extrusion. A.G.Ovchinnikov.
Izv. VUZ Mashinostr. (USSR), no.2, p.68-79 (1983). In Russian.
The existing results of theoretical investigations of forging techniques are used as a basis for their further practical application in the development of new techniques of forging by extrusion, using compact and porous materials; the new techniques include active friction forces and superposition of ultrasonic vibrations. The application of the proposed technological process is exemplified by describing cold stamping by extrusion of oil cans. (7 refs.) *Z.F.V.*

82.20 CHEMICAL KINETICS

68753 Shape normalization of catalyst pellet. D.J.Miller, H.H.Lee (Dept. of Chem. Engng., Univ. of Florida, Gainesville, FL, USA).
Chem. Eng. Sci. (GB), vol.38, no.3, p.363-6 (1983).
A shape normalization, which is applicable in the entire range of Thiele modulus ϕ, is developed. A shape normalization established here for small ϕ and the shape normalization already established here for large ϕ are used in developing the normalization for all ϕ. This normalization brings the $\eta-\phi$ curves for all pellet shapes to a single curve corresponding to infinite slab geometry for all ϕ. The effectiveness factor for any shape of catalyst is simply the effectiveness factor for an infinite slab when the Thiele modulus for the slab is properly defined in terms of the characteristic pellet length and the reaction kinetics. The shape normalization is shown to give negligible error for any pellet configuration and first order reaction, and is postulated to hold for general kinetics and any pellet configuration, by proper definition of the Thiele modulus. (3 refs.)

68754 Deconvolution of overall kinetic data down to the elementary rate constants for a process with an intermediate. Z.Slanina (J. Heyrovsky Inst. of Phys. Chem. & Electrochem., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.579-83 (22 April 1983).
A fitting technique has been suggested which makes it possible to extract, from overall kinetic data, the rate constants of elementary activation steps in the kinetics of a process involving one intermediate. The treatment has been applied to the boat pathway of the Cope rearrangement of 1,5-hexadiene. (29 refs.)

68755 Diffusion-limited reaction rate theory for two-dimensional systems. D.C.Torney, H.M.McConnell (Stauffer Lab. for Phys. Chem., Stanford Univ., Stanford, CA, USA).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.147-70 (8 May 1983).
The Noyes (1961) and Smoluchowski (1916) diffusion-limited reaction rate theories are proved to be equivalent on a lattice. The Noyes theory is analysed and used to predict the kinetics of the two-dimensional irreversible reaction $A+B \rightarrow P$. Only condensed phase reactions with molecules of A and B undergoing Brownian motion (diffusion) are discussed. For comparison, all calculations are done in both two and three dimensions. The two-dimensional rate function $k_N(t)$ in the equation $d[A]/dt=d[B]/dt=-k_N(t)[A][B]$ asymptotically goes to zero as $(\ln t)^{-1}$ as t increases; the asymptotic expansion of $k_N(t)$ is derived from the expansion for the first-return probability in a random walk on a square lattice. The theoretical rate function is determined as a function of the probability α of reaction given an encounter. Although $k_N(t)$ is not significantly different from 'empirical' rate functions in a Monte Carlo simulation of a two-dimensional chemical reaction, it does differ from the rate function in a two-dimensional fluorescence quenching experiment. (36 refs.)

68756 Bifurcation pattern in reaction-diffusion dissipative systems. R.Janssen, V.Hlavacek, P.van Rompay (Dept. of Chem. Engng., Katholieke Univ. Leuven, Leuven, Belgium).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.487-92 (April 1983).
A detailed bifurcation analysis of the reaction-diffusion equations representing the trimolecular model of Prigogine and Lefever ('Brusselator') is performed. The model considers also the diffusion of the initial component. The homogeneous solution to the problem cannot exist and the bifurcation analysis must be performed numerically. There are two ways of possible branching, either the basic branch will be followed or branching from an isolated branch may occur. In both cases, the branching is of the type symmetric→asymmetric→symmetric, etc. For higher dimension of the system a topologically interesting isolated branch of asymmetric solutions was discovered. 82.30 SPECIFIC CHEMICAL REACTIONS; REACTION MECHANISMS

68757 The active role of the solvent in chemical reactivity. J.Bertran (Dept. de Quimica Fisica, Facultad de Quimica, Sevilla, Spain).
THEOCHEM (Netherlands), vol.10, p.129-38 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Nucleophile-electrophile combination reactions, hydrolytic reactions, intramolecular hydrogen shifts and some reactions in which the solvent relaxation plays an important role are studied in order to demonstrate the active role of the solvent. The equilibrium or nonequilibrium of transition state solvation are examined in light of the solvent's active role. (57 refs.)

68758 Macrocyclic receptor chemistry: experimental and theoretical studies on molecular recognition. G.Wipff (Inst. de Chimie, Strasbourg, France), P.A.Kollman, J.M.Lehn.
THEOCHEM (Netherlands), vol.10, p.153-65 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Synthetic macrocyclic receptors containing an intramolecular cavity ('crypt') display remarkable binding properties towards a variety of charged substrates (spherical cations and anions, small molecules, functionalized chains, complexes, etc...) and provide elements for an analysis of the factors involved in the 'lock and key' substrate $\subset$ receptor complementarity within the 'cryptate' inclusion complex formed. Empirical (molecular mechanics) calculations on a typical macrocycle (18-crown-6) and its alkali complexes account for several aspects of spherical recognition (flexibility of the ligand, weak hydrophilicity of the complexed cation, binding specificity, and the 'macrocyclic effect') and give insight into conformational dependent energies of the ligand, a factor not otherwise available. The relative energies of various conformations of a macrobicyclic cryptand have also been investigated. (34 refs.)

68759 Dynamic representation of quantum chemical results using computer graphics: molecular rearrangements, art or science?. J.Weber, M.Roch, J.-J.Combremont (Lab. of Computational Chem., Univ. of Geneva, Geneva, Switzerland), P.Vogel, P.A.Carrupt.
THEOCHEM (Netherlands), vol.10, p.189-200 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
An interactive computer graphics equipment is used as an output device for representing the results of quantum chemical calculations. The advantages of such displays are illustrated by the description of several applications: (i) interactive visualization of molecular properties and (ii) dynamic representation of unimolecular rearrangements. Several examples are chosen among the latter group of applications: reversible formation of cyclobutanes from 1,3-butadiene, intramolecular migration of a methyl group over an allyl substrate, and pseudo-rotation of a seven-membered heterocyclic compound. It is shown that the 3D representation of reaction paths is generally an involved task since, as the geometrical data base is most often incomplete, it is necessary to find a middle ground between chemically reasonable and aesthetically pleasant pictures, thus leading to a technique which lies somewhere in between art and science. (23 refs.)

68760 A theoretical study of the solvent effect on dissociation reactions. The role of the first solvation shell. P.Demontis, E.S.Fois, A.Gamba, B.Manunza, G.B.Suffritti (Phys. Chem. Inst., Univ. Sassari, Sassari, Italy), M.Simonetta.
THEOCHEM (Netherlands), vol.10, p.231-43 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
Within a model describing the solvent effect as mainly due to a restricted number of molecules simulating the first solvation shell, a theoretical study of dissociation reactions, performed by LCAO-MO-SCF approximation at CNDO/2 level, is presented. Several solutes in different solvents have been considered, and in particular the results of a study on the dissociation of CH_3F in H_2 are shown in detail. (16 refs.)

68761 Solvation effects in the phototautomerization of 7-quinolinol. P.J.Thistlethwaite (Phys. Chem. Dept., Melbourne Univ., Parkville, Australia).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.509-12 (22 April 1983).
Some aspects of the enol→keto photoautomerization of 7-quinolinol in methanol have been re-examined. The results show that photoautomerization only occurs in suitably solvated enol tautomers. (11 refs.)

68762 Collisional dissociation of $CH_3O_2^+$. H.Villinger, A.Saxer, R.Richter, W.Lindinger (Inst. fur Experimentalphys., Abteilung Atom- und Molekulphys., Innsbruck, Austria).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.513-16 (22 April 1983).
The collision-induced breakup of $CH_3O_2^+$ ions, produced in various binary ion-neutral reactions, was investigated in a drift experiment in the energy range from 0.2 to 1.2 eV. The products observed were HCO^+ (50%) and H_3O^+ (50%), independent of the collision energy inducing the breakup. The energy barrier for the breakup is 22 ± 6 kcal/mole. (14 refs.)

68763 Conjecture about diffusion-controlled reactions of the solvated electron in alkanols. Farhataziz (Chem. Dept., Texas Woman's Univ., Denton, TX, USA), Riazuddin.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1642-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The solvated electron e_s^-, in alkanols is considered to have a physical zone of volume, V_p, and this volume is surrounded by an inactive zone of volume, V_I, which contains the hydrocarbon parts of the alkanol molecules responsible for solvating the electron. In a diffusion controlled reaction of e_s^- with a neutral species, the neutral species reaches the outer boundary of V_I by the Stokes-Einstein mutual diffusion process. However, neutral species must advance inside V_I before the reaction is completed. Making certain assumptions, the nature of the movement of the neutral species inside V_I and the reaction probabilities at various points inside V_I have been examined, and appropriate mathematical formulation has been developed. A comparison of the computed and experimental results, for the diffusion-controlled reactions of e_s^- with phenanthrene in C_1 to C_{10} 1-alkanols, suggests that the product of the diffusion coefficient of phenanthrene and the reaction probability decreases exponentially with increasing total volume of e_s^-. (13 refs.)

68764 First order decay of the solvated electrons in 1-alkanols at 25°C. Farhataziz, S.Kalachandra (Dept. of Chem., Texas Woman's Univ., Denton, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1645-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Specific rates, in units of $10^4 s^{-1}$, for the pseudo-first order reactions of the solvated electron with its solvents for C_1 to C_{10} 1-alkanols measured by pulse radiolysis at 25°C are given in parentheses after the names of 1-alkanols: methanol and ethanol (10), 1-propanol (6), 1-butanol to 1-octanol (5), 1-nonanol (6), and 1-decanol (≤ 16). These specific rates are discussed in terms of the viscosities of the solvents, radii and masses of the solvated electrons and energies of activation of the reactions. (11 refs.)

68765 Vapor pressure in the dissociation of rhenium disulfide as a function of the composition of the compound. L.E.Ugryumova, R.A.Isakova, V.A.Snurnikova (Inst. of Metal. & Enrichment, Acad. of Sci., Kazakh SSR).
Inorg. Mater. (USA), vol.18, no.6, p.813-16 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.969-72 (June 1982). [received: Feb. 1983]
In a measurement of the vapor pressure by the dew point method the region of homogeneity of rhenium disulfide in the temperature range 873-1473K was determined. The composition of rhenium disulfide with respect to sulfur within the limits of the region of homogeneity varies from 25.3 to 29% by weight. The influence of nonstoichiometry on the vapor pressure in the case of dissociation of rhenium disulfide was demonstrated. Thus, at 873-1473K the vapor pressure of sulfur above alloys belonging to the limit of the region of homogeneity on the sulfur side reaches $(5\text{-}25.3).10^5$ Pa, and at the opposite limit on the metal side in the corresponding temperature range it is lowered to $1.10^{-1}\text{-}5.10^2$ Pa. (15 refs.)

68766 Mechanism of pyrolysis of monosilane at reduced pressure. M.S.Sukhov.
Inorg. Mater. (USA), vol.18, no.7, p.913-18 (July 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.7, p.1077-82 (July 1982). [received: Feb. 1983]
It has been shown that at reduced pressure the pyrolysis of SiH_4 proceeds by two mechanisms with different limiting stages. The activation energies for the heterogeneous and gas phase decomposition were determined as 1.55 and 2.27 eV, respectively. Models for the gas phase and heterogeneous pyrolysis have been proposed. Kinetic equations have been obtained for the growth rate of layers of polycrystalline silicon. (19 refs.)

68767 Substituent effects on benzyl radical ESR hyperfine coupling constants. The $\sigma\alpha^{\cdot}$ scale based upon spin delocalization. J.M.Dust, D.R.Arnold (Dept. of Chem., Dalhousie Univ., Halifax, Nova Scotia, Canada).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1221-7 (9 March 1983).
The electron spin resonance spectra of 21 para- and meta-substituted benzyl radicals have been analyzed. A substituent constant, $\sigma\alpha^{\cdot}$, has been defined from the benzylic α-hydrogen hyperfine coupling constant. The $\sigma\alpha^{\cdot}$ constant reflects the component of energy that may be attributed to spin delocalization in a substituted benzyl radical in comparison to the unsubstituted radical. For the derivatives studied, para substitution is stabilizing, except when fluorine is the substituent; meta substitution destablizes the benzyl radical. A series of radical reactions is reexamined with an extended Hammett relation. The relative importance of spin delocalization vs. polar effects is assessed by the ratio of $\rho^{\cdot}$ to ρ. The importance of choosing substituents for which $\sigma\alpha^{\cdot}$ and σ differ widely for such an assessment is emphasized. (52 refs.)

68768 An ab initio study of the reaction $Be(^3P)+H_2(^1\Sigma_g^+) \rightarrow BeH(^2\Sigma^+)+H(^2S)$. R.A.Poirier, M.R.Peterson, M.Menzinger (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.7, p.4592-6 (1 April 1983).
The lowest triplet potential energy surface for the reaction of metastable $Be(^3P)$ with H_2 has been studied by ab initio SCF-MO and CI calculations. The stationary points along the reaction coordinate were obtained by automatic gradient optimization. Broadside (C_{2v}) attack is found to be favored over the collinear $C_{\infty v}$ approach and a stable intermediate of C_{2v} symmetry is found for $^3BeH_2$. The authors discuss experimental implications for the dynamics of this interesting exothermic process. (29 refs.)

68769 Polarization model for NH_3-H-H_2O proton transfer reaction. C.W.David (Dept. of Chem., Univ. of Connecticut, Storrs, CT, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5268-9 (15 April 1983).
The polarization model for water was extended to ammonia and its polymers up to and including the hexamer. Haymet and Oxtoby (1982) have recently criticized the polarization model as lacking in theoretical foundation, especially in the intermediate internuclear separation domain. With the appearance of the study by Scheiner (1982) in which the proton transfer reaction between ammonia and water is studied with great accuracy, it becomes possible to test the polarization model accuracy exactly in the domain of distances in which Oxtoby has claimed that the polarization model fails. The authors report the polarization model results, comparable to those of Scheiner, which do indeed indicate the poor agreement with ab initio computations. (5 refs.)

68770 Atom-molecule reactive scattering and symmetrized cross section for the system containing identical nuclei. B.H.Choi, R.T.Poe, J.C.Sun, K.T.Tang (Dept. of Phys., Univ. of California, Riverside, CA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5590-605 (1 May 1983).
A formulation of atom-diatomic molecule (or molecular ion) collision on a single potential surface of ground electronic state of triatomic (or ionic) system containing identical nuclei is presented based on the formal multiarrangement channel collision theory. A properly symmetrized scattering matrix which is unitary over all arrangement channels is introduced. The matrix makes the formulation quite systematic. Furthermore, it enables one to extend the formulation efficiently to more general collision systems containing several species of the identical particles by partitioning the arrangement channels into collections of the indistinguishable ones. This is illustrated in the simple three particle atom-diatom system of the present work. Through the matrix, formulas of the optical theorem satisfied by the symmetrized cross sections are also obtained. The adiabatic electronic wave functions are found to be either symmetric or antisymmetric under interchange of nuclear coordinates. It is determined by the electronic states but is independent of the fermion or boson characteristic of the nuclear spin. Formulas of the properly symmetrized cross sections that arise from the nuclear spin statistics of the indistinguishable nuclei are obtained for the symmetric as well as the antisymmetric electronic wave function of the triatomic system. They are obtained in terms of either resultant nuclear spins of the molecules or individual nuclear spin quantum numbers. Depending on the interchange symmetries of the electronic wave functions with respect to nuclear coordinates, the observable cross sections of the reaction for indistinguishable nuclei result in quite different characteristics as manifested, for example, in the principle of detailed balance. When the scattering takes place through direct and exchange collisions coherently, either resultant nuclear spin conversion or rotational parity conversion between initial and final molecules is an indication that the reaction has taken place via exchange scattering for certain types of collisions. For other types of collisions, only the resultant spin conversion is possible in the reactive (exchange) scattering. (54 refs.)

68771 Electronic energy partitioning in reactions occurring on more than one potential energy surface: metastable $Mg(^3P)$ atoms with halogen molecules. A.Kowalski, M.Menzinger (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada).
J. Chem. Phys. (USA), vol.78, no.9, p.5612-20 (1 May 1983).
For the reactions metastable $Mg(^3P)$ atoms and dihalogen molecules F_2, Cl_2, and Br_2, the authors have measured by a beam-gas experiment the absolute cross sections for all three electronic reaction channels: formation of $MgX(X^2\Sigma^+)$ ground state, $MgX(\tilde{A}^2\Pi)$ chemiluminescent products and $MgX^+(^1\Sigma^+)$ chemi-ions. The chemiluminescence and chemi-ion yields both turn out to be of the order of 1% in all three systems. By qualitative MO theory, it is shown that the dynamical bottleneck in the adiabatic chemiluminescence channel is an early barrier and in the diabatic chemi-ionization process a spin flip occurring during the approach phase, following a long-range electron transfer. An information theoretic analysis reveals considerable dynamic bias associated with most of the CL and CI products [except for $MgCl(A^2\Pi)$], and the surprisal plots are nonlinear for all three reactions. (33 refs.)

68772 Dynamics of hydrogen atom and proton transfer reactions. Nearly degenerate asymmetric case. V.K.Babamov (Centro de Graduados, Inst. Tecnologico de Tijuana, Tijuana, Mexico), V.Lopez, R.A.Marcus.
J. Chem. Phys. (USA), vol.78, no.9, p.5621-8 (1 May 1983).
A method for approximate treatment of collinear H atom or proton transfer reactions $AH+B \rightarrow A+HB$ which involve two nearly degenerate vibrational states is developed. The method is based on constructing a diabatic representation of the problem, i.e., one in which the reactant and the product vibrational states are distinguished as such throughout the collision. The diabatic representation is constructed with the aid of the adiabatic one discussed in an earlier paper. The treatment can also be applied to asymmetric exchange reactions in which case it yields good agreement with other results. (21 refs.)

68773 Single and triplet energy surfaces of NiH_2. M.R.A.Blomberg, P.E.M.Siegbahn (Inst. of Theoretical Phys., Univ. of Stockholm, Stockholm, Sweden).
J. Chem. Phys. (USA), vol.78, no.9, p.5682-92 (1 May 1983).
Contracted CI calculations have been performed for the concerted dissociation of NiH_2 into Ni and H_2. All low-lying states have been considered. The most important result of the calculations is that the $^1A_1$ state is much lower in energy than the other states for bent geometries. This state even forms a slightly stable complex with an H-Ni-H angle of 49°. The binding is between Ni *sd*-hybridized orbitals and a weakened H_2 molecule. The ground state of NiH_2 is, however, found to be a linear $^3\Delta_g$ state, with the lowest singlet almost 1.5 eV higher in energy at this geometry. The forbidden dissociation reactions for the triplets and singlets with the lowest barriers proceed in steps with the occupation of each symmetry changing by only one unit in each step. The lowest triplet barrier is 1.8 eV, and for this state a concerted dissociation is slightly preferred over a stepwise loss of a hydrogen at a time. The mechanism for the concerted triplet dissociation may also be through spin-orbit coupling to the $^1A_1$ state, since the states cross. The correlation effects on the potential energy surfaces of NiH_2 are further shown to be of qualitative importance. (31 refs.)

68774 R.F. plasma reactions in light hydrocarbons: effect of the input power on the decomposition of ethane. P.Canepa, G.Castello, M.Nicchia, S.Munari (Istituto di Chimica Industrial, Univ. di Genova, Genova, Italy).
Radiat. Phys. & Chem. (GB), vol.21, no.4, p.381-7 (1983).
The effect of the input power on the plasma decomposition of ethane in an inductively coupled radiofrequency glow discharge was studied with a static system at a constant initial pressure of 0.5 torr, with specific energy E_s, up to 2×10^6 Jg^{-1}. Input power values of 25, 50 and 100 W were used. The gaseous products were analyzed by gas chromatography. The effect of power input change was found to be smaller than the previously studied influence of the initial pressure variation. The yields of C_2H_4 and C_2H_2 slightly increases with increasing W, while the yield of CH_4 shows a greater variation. The yield of C_3H_8 decreases with increasing W and other heavy products do not show appreciable change. The yield of the crosslinked polymethylene formed as solid product slightly increases and its H/C ratio (about 1.5) slightly decreases with increasing *W*. (16 refs.)

68775 Formation of BrO_2 in the Belousov-Zhabotinsky system reaction of aliphatic alcohols with bromate. H.D.Forsterling, H.J.Lambertz, H.Schreiber (Fachbereich Phys. Chem., Philipps-Univ., Marburg, Germany).
Z. Naturforsch. a (Germany), vol.38A, no.4, p.483-6 (April 1983).
BrO_2 was found as an intermediate in the reaction of bromate with alcohols (e.g. methanol, isopropanol, allylalcohol) or ketones (e.g. acetone). This reaction may be important for the understanding of bromate driven oscillators. (12 refs.)

82.35 POLYMER REACTIONS AND POLYMERIZATION

68776 A simple model of the polymerisation process. H.N.V.Temperley (Dept. of Appl. Math., Univ. Coll. of Swansea, Swansea, Wales).
J. Phys. A (GB), vol.16, no.6, p.1241-5 (21 April 1983).
The monomer is taken to be a fluid with purely repulsive interactions, which is treated by the Mayer theory. Some of the repulsions between pairs of monomer molecules are modified to become strong attractions by the assumed polymerising agent; and the gelation point is taken to be determined by the pressure passing through a maximum with increasing density. If the repulsions are taken to be Gaussian, detailed calculations can be made and it is found that the position of the gel point is little affected by correlations between the pairs of molecules whose interactions are modified. (4 refs.)

68777 Polymerization of 16-heptadecenoic acid monolayers. K.C.O'Brien, C.E.Rogers, J.B.Lando (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).
Thin Solid Films (Switzerland), vol.102, no.2, p.131-40 (15 April 1983).
Monolayers of heptadecenoic acid (vinyl acid) were spread at a gas-water interface. The terminal double bond of the vinyl acid enabled it to be polymerized on exposure to UV radiation. Pressure-area isotherms for both monomer and polymer vinyl acid were then recorded and compared with isotherms from similar compounds. Preliminary studies were conducted to minimize the degree of dissolution of the fatty acid. The polymerization kinetics were examined by the use of UV spectroscopy and measurements of the reduction in the area occupied by the film at a constant surface pressure. The reaction appeared to follow zero-order kinetics after an initial acceleration period. The rate constant for the reaction increased with increasing surface pressure. A dynamic mechanical test was performed to determine the mechanical properties of monolayers at the gas-water interface. Films were polymerized to various conversions and then examined to determine the relation between mechanical properties and conversion. A simple model is proposed to correlate the monolayer's structure and the dynamic mechanical data. (14 refs.)

(see also 66.10 Ionic conduction in liquids; for electro-osmosis, see 82.65)

68780 The effect of bubbles attached to an electrode on electrical resistance and dissolved gas concentration. S.D.R.Wilson, A.Hulme (Dept. of Math., Univ. of Manchester, Manchester, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.133-46 (8 May 1983).
When a process of electrolysis results in the evolution of gas, the gas forms bubbles at nucleation sites on one or both electrodes. These bubbles grow and eventually detach themselves. It is important to know what effect the bubbles will have on the voltage of the electrolytic cell because of the high cost of electrical power. Although the free bubbles have been much studied, the attached bubbles have not. Here the additional resistance due to the attached bubbles is calculated by means of an asymptotic method which is valid (roughly speaking) when the bubbles are widely spaced and the mean spacing is small compared with the inter-electrode gap. A similar method is used to calculate the degree of supersaturation of the dissolved gas; this is of interest because it influences the reversible voltage of the cell. (11 refs.)

68781 Activity coefficients of electrolytes. J.N.Nanda (Panjab Univ., Chandigarh, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.584-8 (Nov. 1982). [received: April 1983]
The ion lattice concept is extended to the solution of electrolytes. It is shown that the experimental values of activity coefficients of dilute solutions conform more to the cube root law than to the square root law. At high concentration there is the opposite effect of ion compression which should be calculated separately. An empirical constant may explain the experimental curves for various electrolytes. (6 refs.)

68782 Digital simulation of transient isoelectric focusing. A.Graham, O.A.Palusinski, R.A.Mosher, M.Bier (Biophys. Technol. Lab., Univ. of Arizona, Tucson, AZ, USA), D.A.Saville.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.92-4 vol.4
The results of a digital simulation of the transient evolution of an isoelectric focusing (IEF) system are presented. The simulation employed a recently developed comprehensive mathematical model of IEF processes. The nonlinear parabolic equations of the general theory are given for the simulated system. The numerical technique applied and the data from a sample computation are discussed. (7 refs.)

82.50 PHOTOCHEMISTRY AND RADIATION CHEMISTRY

(see also 33.50 Fluorescence, phosphorescence; radiationless transitions)

68783 Photochemistry in Van der Waals complexes: observation of the intermediate state of the Hg*, Cl_2 reaction. C.Jouvet, B.Soep (Lab. de Photophys. Moleculaire, Univ. Paris-Sud, Orsay, France).
Chem. Phys. Lett. (Netherlands), vol.96, no.4, p.426-8 (15 April 1983).
A novel method designed to observe the collision complex of a photochemical reaction is reported here. The reactants Hg, Cl_2 are frozen in a Van der Waals complex (Hg-Cl_2), and then promoted by an optical excitation (250 nm) to the reactive state. The broad complex action spectrum, presumably due to the Hg^+-Cl_2^- intermediate, is monitored through the $HgCl(B^2\Sigma^+)$ fluorescence. (7 refs.)

68784 Infrared multiphoton decomposition and energy-dependent adsorption cross sections of chloroethane-d_0, -2-d_1, and -2, 2, 2-d_3. J.S.Francisco, Zhu Qingshi, J.I.Steinfeld (Dept. of Chem., MIT, Cambridge, MA, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5339-50 (1 May 1983).
The infrared photochemistry of chloroethane-d_0, -2-d_1, and -2, 2, 2-d_3 have been investigated. In all cases, the multiple infrared photon induced dissociation is found to proceed by four-center elimination of HCl (or DCl). An energy-grained master equation is used to interpret the data; in this way, the energy-dependent photon absorption cross section $\sigma(E)$ is determined for all three species. The functional form of $\sigma(E)$ approaches that for a 'large' (i.e. high density of states) molecule with increasing deuteration. Ensemble properties, such as vibrational energy distributions and average energy deposition, can then be determined; but these observables do not by themselves suffice to determine a unique form for $\sigma(E)$. A form for $\sigma(E)$ can, however, be specified within certain limits by applying constraints imposed by intramolecular vibrational coupling models. (63 refs.)

68785 Infrared multiphoton decomposition of monosilane sensitized by silicon tetrafluoride. P.A.Longeway, F.W.Lampe (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.354-8 (20 Jan. 1983).
The decomposition of SiH_4, sensitized by the multiphoton absorption of unfocused infrared laser radiation by SiF_4, has been studied at a fluence of 0.31 J/cm^2 and over a total pressure range of 3-16 torr. In contrast to the direct infrared multiphoton induced decomposition, the only volatile products observed were H_2 and Si_2H_6 which, within experimental error, were formed in equal amounts. It is proposed that collisional energy transfer from vibrationally excited SiF_4 produces internally excited SiH_4 molecules which break down exclusively to SiH_2 and H_2. This is followed by insertion of SiH_2 into SiH_4 to form Si_2H_6. The absence of Si_3H_8 and higher silanes in the volatile products, which is characteristic of other silane decomposition studies, is attributed to the absence of SiH_3 radicals and the fact that the SiH_4 molecules attacked by SiH_2 contain only that excess vibrational energy characteristic of thermal equilibrium at 300K. (29 refs.)

68786 Electron spin resonance of spin-trapped radicals in γ-irradiated aqueous uracil solutions. Chromatographic separation of radicals. K.Makino, M.M.Mossoba, P.Riesz (Nat. Cancer Inst., Nat. Inst. of Health, Bethesda, MD, USA).
J. Phys. Chem. (USA), vol.87, no.6, p.1074-80 (17 March 1983).
Air-saturated aqueous uracil solutions were γ irradiated at room temperature in the presence of 2-methyl-2-nitrosopropane (the spin trap). The resulting radicals were separated subsequently by high-performance liquid chromatography and detected by ESR. With a phosphate buffer (pH 7.0), the spin adduct, NH-C(=O)-NH-C(=O)-CH(-OH)-CH-N(O.)-^{t}Bu (A), was obtained while with a Na_2HPO_4-NaOH buffer (pH 11.0), the spin adduct (B) which has the same chemical structure as (A) but shows a different ESR spectrum from that of (A) was separated. The spin adducts, A and B, were found to be cis-trans isomers of each other. The assignments for these spin adducts were confirmed. In addition to these spin adducts, NH-C(=O)-NH-C(=O)-CH-(-N(O.)-^{t}Bu)-CH-OH (C) was obtained. The ESR spectra of A, B, and C were compared with those obtained from UV-irradiated aqueous dihydrouracil solutions containing MNP and H_2O_2 at various pH values. (29 refs.)

68787 An optimized device for UF_6 laser isotopic photochemistry using an optical parametric oscillator and a down converter. P.Kupecek, J.M.Weulersse, P.Isnard, M.Alexandre, M.Clerc (Dept. de Phys.-Chimie, CENS, Gif-sur-Yvette, France).
J. Opt. (France), vol.14, no.1, p.43-8 (Jan.-Feb. 1983).
Describes a tunable coherent source near 16 μm for selective photochemistry studies on UF_6. The device uses a YAG:Nd^{3+} pumped lithium niobate optical parametric oscillator coupled with a cadmium selenide frequency down converter. The components and physical parameters have been optimized leading to an overall optical conversion efficiency of about 6.10^{-3}, i.e. a quantum yield of 0.1. The main characteristics such as beam quality and spectral width have been measured, the last one being 60 mK at 16 μm, for 1.5 mJ pulses. (5 refs.)

82.60 CHEMICAL THERMODYNAMICS

(see also 05.70 Thermodynamics)

68788 Estimation of free energy of formation of $Mg_3V_2O_8$ between 298 and 1200K. S.K.Lau (Westinghouse Res. & Dev. Center, Pittsburgh, PA, USA).
J. Mater. Sci. Lett. (GB), vol.2, no.4, p.137-8 (April 1983).
The free energy of formation (ΔG_f^0) of $Mg_3V_2O_8$ between 298 and 1200K is estimated from that of $Mg_2V_2O_7$, by the application of thermodynamic principles. (8 refs.)

68789 Results of investigations of the enthalpies of melting of salt eutectics. E.K.Rodionova, N.M.Martynova, L.I.Cherneeva (G.M. Krzhizhanovskii Energy Inst., USSR).
High Temp. (USA), vol.20, no.4, p.556-61 (July-Aug. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.4, p.671-6 (July-Aug. 1982). [received: April 1983]
Results are discussed of the measurements carried out to date of the enthalpies of melting of salt eutectics. A method is proposed for calculating ΔH_m for a series of eutectics by estimating the enthalpies of mixing from the phase diagrams. Results are presented for the calculation of ΔH_m of salt eutectics based on the additivity of the entropy. (23 refs.)

68790 Heat capacities of solution for alcohols in polar solvents and the new view of hydrophobic effects. D.Mirejovsky, E.M.Arnett (Dept. of Chem., Duke Univ., Durham, NC, USA).
J. Am. Chem. Soc. (USA), vol.105, no.5, p.1112-17 (9 March 1983).
Heat capacities of solution ($\Delta C_{p2}°$) are presented for methanol, 1-butanol, and 1-pentanol in dimethyl sulfoxide, *N,N*-dimethylformamide, *N*-methylformamide, ethylene glycol, and ethylammonium nitrate, a low-melting fused salt. In all cases, $\Delta C_{p2}°$ values are negligible compared to those in water. The unique heat capacity behavior of aqueous solutions persists even in concentrated solutions of urea. Water-like behavior was suggested by the heats, entropies, and free energies of solution for nonpolar gases in ethylammonium nitrate, by a nearly ideal heat of mixing with water, and by the ability of this solvent to produce micelles from surfactants. The failure of ethylammonium nitrate to exhibit water-like heat capacity behavior differentiates those properties of water which are due to fluctuations between forms of different geometry and density from those which are caused by its high cohesive energy. (69 refs.)

68791 The hydrogen chloride dimer energy from the second virial coefficient. J.G.Powles, M.Wojcik (School of Chem. Engng., Cornell Univ., Ithaca, NY, USA).
J. Chem. Phys. (USA), vol.78, no.8, p.5277-8 (15 April 1983).
There is currently considerable interest in the interaction potential between simple polar molecules and in particular for hydrogen choride. The authors consider one important aspect of the intermolecular potential, the dimer-interaction energy. The authors use recent accurate data for the pressure second virial coefficient B(T) for HCl over a wide range of temperatures and the method of Lambert to evaluate the enthalpy of dimer formation. (14 refs.)

68792 Calorimetrical investigation of the interaction between stannic tetrachloride and diethyl ether in nitrobenzol and 1,2-dichloroethane solutions. N.A.Morozova, Yu.V.Kondratiev, A.V.Suvorov, V.N.Osokin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.108-10 (Feb. 1983). In Russian.
The method of calorimetrical titration with continuous addition of titrant is used for investigating the interaction between $SnCl_4$ and Et_2O in solutions of $C_2H_4Cl_2$ and $C_6H_5NO_2$. It is found that the enthalpies of addition of the second donor molecule to $SnCl_4$ in somewhat less than enthalpies of addition of the first molecule. (3 refs.)

68793 A shifted equilibrium equation for reactions with variable composition phases. A.N.Marinichev.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.118-20 (Feb. 1983). In Russian.
Equations describing the phase process for variable composition phases are derived from generalized differential van der Waals equations and mass balance conditions. The proposed equations are used for estimating entropy variation during the condensation of ternary heterozeotrope in the system nitromethane-water-*n*-hexane. (8 refs.)

82.65 SURFACE PROCESSES

68794 The finite and infinite cubes as models for understanding heterogeneous catalysis. L.Salem, R.Elliott (Lab. de Chimie Theorique, Univ. de Paris-Sud, Orsay, France).
THEOCHEM (Netherlands), vol.10, p.75-84 (May 1983). (XIII Congress of Theoretical Chemists of Latin Expression, Alghero, Sardinia, 5-8 Oct. 1982).
The finite cube, introduced by Messmer (1977) and by Salem and Leforestier (1977) leads to the same energy bands as one would obtain by the Slater-Koster method for an infinite metallic cubic crystal. Realistic calculations may thus be performed on a cube with N atoms along each dimension, with N allowed to become infinite whenever necessary. In this manner the authors study the interaction at the (xy) surface of the cube between a diatomic (H_2) molecule and the d_{xz} and s molecular orbitals of the metal. The interaction between the σ_x* orbital of H_2 and the d (or s) band, for instance, is proportional to $\cos 1/2.l\pi/N+1$(or $\sin 1/2.l\pi/N+1$) where l is the quantum number which labels the metal orbitals along the x direction (top of band: l+1 for d band; l=N for s band). As an illustration, results are given for the perturbative interaction between H_2 and metal bands filled up to the Fermi level. (8 refs.)

68795 Magnetocatalytic effect on rare earth oxides. J.Jugel, G.-M.Schwab, J.Voitländer (Inst. fur Phys. Chem., Univ. Munchen, Munchen, Germany).
J. Chem. Phys. (USA), vol.78, no.7, p.4755-62 (1 April 1983).
The rates of ortho-para hydrogen conversion on some self-supported rare earth oxides have been measured at room temperature. The change of the rates by application of a weak external magnetic field has been determined. Only on Pr_2O_3 and Yb_2O_3 a small decrease of the rates could be observed. On the basis of two coupled proton spins under the influence of a magnetic field—composed of an extrinsic and an intrinsic part—a simple theory is given which explains the occurrence, the sign and also the field dependence of the magnetocatalytic effect. It is found that the sign depends upon the mutual orientation of the H_2 molecules and the magnetic moments of the active sites. Finally, the theory allows one to deduce the well-known formula for the ortho-para hydrogen conversion rate given by Wigner (1933). (11 refs.)

68796 Field induced and surface catalyzed formation of novel ions: a pulsed-laser time-of-flight atom-probe study. T.T.Tsong, T.J.Kinkus, C.F.Ai (Phys. Dept., Pennsylvania State Univ., University Park, PA, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4763-75 (1 April 1983).
High electric field induced formation of novel ions such as H_3^+, AuH_2^+, $RhHe^{2+}$, and $PtHe_2^{2+}$ on metal surfaces has been studied in the pulsed-laser time-of-flight atom-probe field ion microscope. From the fractional abundances, and the high resolution mass spectra and energy distributions measured for these ions, several conclusions can be drawn. Field desorption of hydrogen below the evaporation field of the substrate often results in formation of H_3^+ ions. This formation depends not only on the applied field strength, but surprisingly also on the material and the atomic structure of the substrate. Plenty of H_3^+ ions can be found from the high index planes and the lattice steps of Mo, W, and Au surfaces in the field range of 2 to 3 V/Å. Few are found from Ir and Ni surfaces, and none are found from the densely packed W(110) plane. Formation of H_3^+ can therefore be considered a surface catalyzed and field induced chemical reaction. Using H_2-D_2 mixed gases, the authors find little correlation between the ionic species observed in field desorption and the chemisorption states of the gases estimated to be on the order of 5×10^{-13} s. (25 refs.)

68797 A static SIMS rate measurement of the reaction $2H(a)+O(a)\rightarrow H_2O(a)$ on Pt(111). K.M.Ogle, J.R.Creighton, H.S.Luftman, J.M.White (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
J. Chem. Phys. (USA), vol.78, no.9, p.5839-40 (1 May 1983).
The authors report a study of the rate of reaction between two chemisorbed reactants H(*a*) and O(*a*) to form a chemisorbed product $H_2O(a)$ on a single crystal transition metal surface Pt(111). This kind of information is important for the detailed molecular level description of the reaction $H_2(g)+1/20_2(g)\rightarrow H_2O(g)$ catalyzed by platinum. The catalyzed reaction involves nonactivated dissociative chemisorption of H_2. The activation energy for the formation of chemisorbed H_2O can thus be calculated by measuring its rate of formation when O(*a*) is exposed to $H_2(g)$. (9 refs.)

68798 Quantitative treatment of micellar effects upon the nucleophilicity of halide ions. H.Al-Lohedan, C.A.Bunton, J.R.Moffatt (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.332-5 (20 Jan. 1983).
Nucleophilic attack upon methyl benzenesulfonate (1) by Cl^- or Br^- occurs readily in aqueous cetyltrimethylammonium chloride or bromide (CTACl or CTABr, respectively). The increase of rate constant with [surfactant] can be analyzed in terms of the concentration of 1 and halide ion in the micellar pseudophase, and the second-order rate constants in micellar and aqueous pseudophases are similar. (35 refs.)

68799 Micellar effects upon dephosphorylation in water and aqueous 1,2-diols. C.A.Bunton, L.-H.Gan, F.H.Hamed, J.R.Moffatt (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.336-41 (20 Jan. 1983).
Cationic micelles of cetyltrimethylammonium bromide and chloride (CTABr and CTACl) in aqueous ethane- and propane-1,2-diol speed the reaction of OH^- with *p*-nitrophenyl diphenyl phosphate (pNPDPP). The reaction with F^- was examined in aqueous ethane-1,2-diol. The rate-surfactant profiles have been treated quantitatively by use of the ion-exchange pseudophase model and, for the reaction with OH^-, direct comparison has been made with the profile for reaction in aqueous CTABr. (40 refs.)

68800 Effect of the diffusion boundary layers on the surface charge density in passive membranes. J.A.Ibanez (Dept. of Thermal Sci., Autonomous Univ. of Barcelona, Barcelona, Spain), A.Hernandez, A.F.Tejerina.
J. Non-Equilibrium Thermodyn. (Germany), vol.7, no.6, p.363-70 (1982).
The superficial charge density of a passive membrane may be determined from the Gouy-Chapman double layer potentials on the membrane surfaces. A method to obtain the Gouy-Chapman potentials, which was explained by the authors (1982) in a previous paper, is modified considering the influence of the diffusion layers adhered to the membrane. The modified method is applied to several Nuclepore membranes bathed by two solutions of NaCl at different concentrations, getting then their surface charge densities. The dependence of these charge densities as related to the most concentrated solution is studied here. (8 refs.)

68801 Properties of small metal particles. R.C.Baetzold, J.F.Hamilton (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).
Prog. Solid State Chem. (GB), vol.15, no.1, p.1-53 (1983).
The intense interest among both academic and industrial scientists in heterogeneous catalysis over the past few years is certainly apparent from even a cursory review of the scientific literature. It is hardly necessary to point out, therefore, that this practical application has provided a strong incentive for the study of small metal clusters, with the aim of gaining working control of their catalytic activity. Small metal particles arouse curiosity also for more fundamental reasons. It seems basic to an understanding of the condensed state to know how electronic and other properties change as metal atoms come together to form dimers and trimers and so on, until finally a unit develops that has the full characteristics of the bulk solid. Indications of unique behavior of small clusters, together with the development of many new experimental and theoretical techniques, have resulted in a focusing of much effort on this area of research and the generation of many new data. As a result the level of understanding in this field has advanced significantly over the past few years. The authors review some of the major developments in the science of very small metal clusters. (217 refs.)

68802 Esters dissociatively adsorb on alumina. A.Bayman, P.K.Hansma (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA), L.H.Gale.
Surf. Sci. (Netherlands), vol.125, no.3, p.613-23 (March 1983).
Inelastic electron tunneling spectra for esters of the form RCOOR′ show that these compounds dissociate on alumina and only the $RCOO^-$ ion bonds to the surface. For phenethyl benzoate, ethyl-d_5 benzoate, benzyl-d_7 benzoate, the benzoate ion is symmetrically adsorbed. For ethyl-d_5 acetate, the spectrum is distinguishable from the spectrum of a symmetrically bonded acetate ion. (34 refs.)

68803 On the influence of the electrode nature on electroosmotic fluid velocity in quartz powder diaphragms. N.G.Sharova, N.Yu.Tumakova, A.F.Rabinovich.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.121-3 (Feb. 1983). In Russian.
Changes in electroosmotic velocity in active diaphragms are investigated using different electrodes. Different changes in electroosmotic velocity can be explained by physico-chemical reactions on the surface. (6 refs.)

82.70 DISPERSE SYSTEMS

(for flow behaviour, see 47.55K)

68804 The measurement of emulsion phase voidage in gas fluidized beds of fine powders. G.F.Barreto, J.G.Yates, P.N.Rowe (Dept. of Chem. & Biochem. Engng., Univ. Coll. London, London, England).
Chem. Eng. Sci. (GB), vol.38, no.3, p.345-50 (1983).
The results of two different experimental methods, X-ray absorption and bed collapse, for the determination of the emulsion-phase voidage of gas fluidized beds are compared. It is shown that good agreement exists between them over the range of gas velocities studied, but that possible differences in voidage in an axial direction are only revealed by the X-ray technique. The bed collapse method applied to a Geldart Group A powder confirms that there is little difference between the surface settling rates of a bubbling bed and of a uniformly expanded bed of the same voidage. (9 refs.)

68805 Changes of certain properties of applied and nonapplied matrices of zirconium hydroxide in the course of ageing. Yu.I.Sukharev, V.V.Rudneva, Yu.V.Egorov (Sergo Ordzhonikidze Siberian Metall. Inst., USSR).
Inorg. Mater. (USA), vol.18, no.6, p.826-30 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.983-7 (June 1982). [received: Feb. 1983]
The introduction of selenite ions as applicant materials into the matrix of zirconium hydroxide during the synthesis leads to a narrow molecular weight distribution for the gels; this implies good reproducibility and control of the synthesis. An increase in the concentration of the applicant material shifts the maxima toward lower molecular weights. The conformational features of the polymeric species formed in the process of removing the applicant material by caustic tend to favour olation cross-linking of the matrix (holding for 30-60 days) on the background of its hydration. The well-developed network of strong hydrogen bonds that is formed in this case has the end result of breaking up these formations, with a narrowing of the molecular weight distribution and the formation of a 'second hydrate shell'. A similar breakdown has been noted for the nonapplied samples. In these cases, the hydrogen bond is the main factor in structural self-organisation of the gel system when it is far from equilibrium conditions. The sorption and other properties of hydroxide gels must be related not only to the features of the synthesis and the conditions under which the material is to operate, but also to the time parameter, i.e. the age of the particular sorbent under investigation must be indicated. The ion application method can provide a means for a considerable stabilisation of HZD gel properties with respect to time. (8 refs.)

68806 Variational model for micelle structure. F.H.Stillinger (Bell Labs., Murray Hill, NJ, USA).
J. Chem. Phys. (USA), vol.78, no.7, p.4654-61 (1 April 1983).
A free energy variational principle is proposed for the study of aggregation structures in amphiphile solutions. For nonionic amphiphiles the postulated free energy functional depends on the scalar concentration fields for solvophilic head groups (H) and solvophobic tail groups (T); it has a form appropriate for a binary mixture of head-group chains and tail-group chains supplemented by a term that enforces chemical bond connection between pairs of those chains. Numerical solutions to the Euler equations for the variational principle are presented for molecules with formal constitution $(H)_{10}$ $(T)_{10}$, under conditions of spherical aggregate symmetry. These solutions include globular micelles, hollow vesicles, and a type of point defect in a smectic A lamellar system. (19 refs.)

68807 Comparative studies between monomeric and polymeric sodium 10-undecenoate micelles. C.M.Paleos, C.I.Stassinopoulou, A.Malliaris (Nuclear Res. Center 'Demokritos', Athens, Greece).
J. Phys. Chem. (USA), vol.87, no.2, p.251-4 (20 Jan. 1983).
When aqueous solutions of sodium 10-undecenoate at concentrations above the CMC of the surfactant (8.24 g/dm^3; 0.04 M) are irradiated by γ rays the low molecular weight polysoap poly(sodium 10-undecenoate) is formed which has a degree of polymerization equal to ten and exhibits micellar behavior by solubilizing hydrophobic molecules. Fluorescence studies with the micropolarity probe pyrene show that the fluorophore penetrates the intramolecular polymeric micelle less than the monomeric one. When the concentration of poly(sodium 10-undecenoate) in water exceeds 2.06 g/dm^3 hydrophobic aggregation of intramolecular micelles occurs which leads to the formation of large 'intermolecular' micelles having an intrinsic viscosity of 0.079100 mL/g compared to 0.048100 mL/g for the intramolecular and monomeric micelles. (14 refs.)

68808 Static and dynamic light scattering studies of micellar growth and interactions in bile salt solutions. P.Schurtenberger, N.Mazer, W.Kanzig (Lab. fur Festkorperphys., ETH, Zurich, Switzerland).
J. Phys. Chem. (USA), vol.87, no.2, p.308-15 (20 Jan. 1983).
From static and dynamic light scattering measurements the authors have deduced the apparent mean aggregation number ($\bar{n}_{app}$) and mean hydrodynamic radius $(R_H)_{app}$ for sodium taurodeoxycholate (TDC) micelles as a function of TDC concentration (0.25-10 g/dL) in 0.8 M NaCl at 20°C. The data are analyzed in terms of a general theoretical framework incorporating the possible influences of micellar growth and micellar interactions. The studies provide strong support for the view that TDC micelles grow into elongated structures above the CMC in the presence of high NaCl concentration. (46 refs.)

68809 Computer simulation of a model for irreversible gelation. H.J.Herrmann (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA), D.Stauffer, D.P.Landau.
J. Phys. A (GB), vol.16, no.6, p.1221-39 (21 April 1983).
A random mixture of bifunctional and tetrafunctional units is placed on a simple cubic lattice. Permanent bonds between these units are then formed by the random motion of active centres (radicals) resulting in a model for the gelation of polyacrylamide and similar processes. The largest of the clusters formed by this kinetic percolation process is identified with the gel fraction, the 'mean cluster size' with the weight-average degree of polymerisation. The critical exponent γ of the mean cluster size is roughly the same as for random percolation, that is, different from that of the 'classical' theory of Flory (1941) and Stockmayer (1943), but the corresponding amplitude ratio, that is, the ratio of average molecular weight on both sides of the gel point, differs strongly from its value in random percolation. Thus, this kinetic gelation model seems to belong to a universality class of its own, different from both that of random percolation and that of classical gelation theories. (45 refs.)

68810 Flows of magnetizable fluid with a bounded free surface. V.G.Bashtovoi, R.A.Foigel'.
Magnetohydrodynamics (USA), vol.18, no.3, p.231-6 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.27-32 (July-Sept. 1982). [received: April 1983]
The perspectives of the practical application of the flow of a magnetizable fluid with a free surface in a number of het and mass transfer processes have been repeatedly noted in the literature. Film flow of magnetizable fluids have been discussed in a number of works which considered the hydrodynamics and stability of the laminar flow of the film, the stability of tangential break in jet flows, the convective and surface instability of nonisothermal layers of a magnetizable fluid, and other problems. These works studied either planar infinite, or circular cylindrical, layers with axial symmetry. In real instruments which use magnetizable fluids, however, other geometrical forms of the layers are realized whose characteristic feature is the boundedness of the free surface. In this case, the earlier results are either inaccurate, or cannot be used at all. Therefore, the work is devoted to the study of the hydrodynamics of similar flows, and the effect on these flows of the geometrical form of the layer. (6 refs.)

68811 Experimental investigation of effective magnetic fields in a magnetic fluid. Yu.I.Dikanskii.
Magnetohydrodynamics (USA), vol.18, no.3, p.237-40 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.33-6 (July-Sept. 1982). [received: April 1983]
An important part of current research on magnetic fluids (MF) is the investigation of the dipole interaction of particles and the associated structural state of such systems. The author investigates the effective magnetic fields in magnetic fluids due to the orientational effect of the particles on one another. The constants of the effective field are calculated from the temperature and concentration dependences of the differential magnetic susceptibility. (5 refs.)

68812 Magnetic properties of highly conducting magnetic liquids. B.B.Sviklis.
Magnetohydrodynamics (USA), vol.18, no.3, p.241-4 (July-Sept. 1982). Translation of: *Magn. Gidrodin. (USSR)*, vol.18, no.3, p.37-41 (July-Sept. 1982). [received: April 1983]
The author presents the characteristics of the influence of various external effects on the magnetic properties of liquid, highly conducting magnetizable media, especially within the ranges of maximum sensitivity of these systems to the effects of various factors, and also in the regions where their magnetic characteristics vary in a nonmonotonic manner. In the majority of cases considered, controlling roles are played both by the variation of the initial magnetic susceptibility for the liquid $\dot{\chi}$, its magnetization saturation M_n, the magnetic component of the yield stress τ_{MD} and the variation of the magnetic moment m, the energy of magnetic anisotropy W_a, the amplitude of the fluctuation in the field of thermal motion of the magnetic moment A_F and the energy of the dipole-dipole interaction $W_{MT} = W_M/kT$ for the magnetizable particle. (2 refs.)

68813 Theory of thermophoresis of moderately large aerosol particles. A.B.Poddoskin, A.A.Yushkanov, Yu.I.Yalamov (N.K. Krupskaya Regional Pedagogic Inst., Moscow, USSR).
Sov. Phys.-Tech. Phys. (USA), vol.27, no.11, p.1383-8 (Nov. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.11, p.2253-61 (Nov. 1982). [received: May 1983]
A systematic theory is developed for thermophoresis of moderately large spherical aerosol particles in the context of gas dynamic theory. Nonuniform gas kinetic theory is used to derive the boundary conditions for the temperature and velocity components. An ellipsoidal model is used to handle the collision integrals in the Boltzmann equation. The boundary conditions are then used to calculate the thermophoresis rate of moderately large aerosol particles. (19 refs.)

82.80 CHEMICAL ANALYSIS AND RELATED PHYSICAL METHODS OF ANALYSIS

68814 Multiplex methods in atomic spectroscopy. K.W.Busch, L.D.Benton (Dept. of Chem., Baylor Univ., Waco, TX, USA).
Anal. Chem. (USA), vol.55, no.3, p.445A-60 (March 1983).
Multielement analysis is an area of research aimed at increasing the efficiency of analytical atomic spectroscopy. Ever since the development of spectrography, workers have consistently sought electronic alternatives to photographic detection. The article is concerned with electronic multiwave-length detection methods, collectively referred to as multiplex methods. (62 refs.)

68815 Quantitative determination of catalytic surface adsorption sites by Fourier transform infrared photoacoustic spectroscopy. J.A.Gardella,Jr., Da-Zhen Jiang, E.M.Eyring (Dept. of Chem., Univ. of Utah, Salt Lake City, UT, USA).
Appl. Spectrosc. (USA), vol.37, no.2, p.131-3 (March-April 1983).
The use of Fourier transform infrared photoacoustic spectroscopy (FT-IR/PAS) as a method for quantitative analysis of surface adsorption sites is demonstrated. A calibration curve is constructed for the amount of CO(g) in the sample cell with a silica internal reference. This calibration curve is utilized to calculate the amount of CO(ads) by subtraction on a catalytic surface where both CO(g) and CO(ads) exist at equilibrium. This analysis combines the qualitative analytical capabilities of PAS with quantitative analysis. (22 refs.)

68816 Fourier transform infrared evolved gas analysis (FT-IR-EGA). J.O.Lephardt (Philip Morris Res. Center, Richmond, VA, USA).
Appl. Spectrosc. Rev. (USA), vol.18, no.2, p.265-303 (1982-1983).
Since their commercial introduction, Fourier transform infrared spectrophotometers have enabled a variety of new infrared applications not possible or practical with other spectrophotometers. One such application—evolved gas analysis (EGA)—has received relatively little attention although its potential is quite significant. A discussion of the background of Fourier transform infrared evolved gas analysis (FT-IR-EGA), the experimental considerations of this technique, and some application areas for this technique are presented. (13 refs.)

68817 Compositional characterization of microwave plasma a-Si:H films. J.F.Currie, P.Depelsenaire, J.P.Huot, L.Paquin, M.R.Wertheimer, A.Yelon (Dept. de Genie Phys., Ecole Polytech. de Montreal, Montreal, Quebec, Canada), C.Brassard, J.L'Ecuyer, R.Groleau, J.P.Martin.
Can. J. Phys. (Canada), vol.61, no.4, p.582-90 (April 1983).
The concentration of hydrogen in amorphous hydrogenated silicon films prepared by microwave glow discharge decomposition of silane has been measured as a function of several fabrication parameters: substrate temperature, deposition rate, and partial pressures of silane and of argon. Hydrogen concentration profiles have been obtained by two techniques: elastic recoil detection (ERD) with a 30 MeV ^{35}Cl beam, and by the resonant nuclear reaction $^{15}N+{}^{1}H\rightarrow{}^{12}C+{}^{4}He+\gamma$. Both offer very high depth resolution (in the order of 100 Å) and have revealed important inhomogeneities in chemical composition, both at the free surface and the substrate-film interface. Using standard infrared absorption measurements between 1950 and 2150 cm^{-1}, the intensities of the lines normally associated with SiH, SiH_2, and SiH_3 bonds were measured. As has been previously reported for reactively sputtered films for some fabrication conditions, the sum of the three intensities is not consistent with the total hydrogen concentration obtained from the nuclear measurements. The average hydrogen concentration decreases with increasing substrate temperature, changes little with deposition rate, and increases as the silane to argon ratio is increased. These observations are related to the chemical reactions which take place in the plasma, and at the plasma-film interface during film growth. (24 refs.)

68818 Ion induced X-rays for X-ray fluorescence analysis. L.Grodzins, P.Boisseau (Lab. for Nuclear Sci., MIT, Cambridge, MA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1271-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Energetic ions bombarding pure element targets induce the characteristic X-rays with high probability and with negligible bremsstrahlung background. The cross sections for X-ray production by protons reach 10^3 b and heavy ions attain cross sections Z^2 times higher. Small accelerators can produce monoenergetic X-rays from 1 to 20 keV with fluxes in excess of 10^{10}/sr/μA of protons; heavy ion accelerators can achieve one to two orders of magnitude more. These ion induced X-rays can be quite effective for X-ray induced X-ray fluorescence. For bulk samples, the method of IXX is as sensitive as PIXE itself; for many elemental analysis problems IXX may be the preferred technique. (16 refs.)

68819 External beam PIXE programs at the University of California, Davis. R.A.Eldred (Crocker Nuclear Lab., Univ. of California, Davis, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1276-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A PIXE system in which large or delicate samples are excited by a low-current external proton beam is described. This system has been used to analyze historical printed books and manuscripts, as well as a large variety of archeological artifacts. The steps used to protect the sample from unnecessary beam current are examined. A recent thorough study of the first volume of the Gutenberg 42-line Bible is described in some detail. (6 refs.)

68820 Depth profiling using proton induced X-rays: the influence of experimental and theoretical uncertainties. M.Geretschlager, H.Paul (Inst. fur Experimentalphys., Johannes-Kepler-Univ. Linz, Linz, Austria).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1280-1 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The mean depth (a), the mean width (b) and the relative concentration (c) of an unknown distribution of foreign atoms in bulk material can be determined by relative X-ray yield measurements. It is shown by means of a set of case studies for rectangular distributions of foreign Cu-atoms in Ag-bulk to which extent experimental X-ray yield errors, and errors in the theoretical description of the X-ray production process and the stopping of projectiles contribute to errors in the result. The theoretical description uses the ECPSSR theory and takes experimental deviation from this theory, energy loss straggling and multiple scattering into account. (19 refs.)

68821 Sputtering analysis with PIXE. J.M.Lambert, P.A.Treado (Georgetown Univ., Washington, DC, USA), D.Trbojevic, R.G.Allas, A.R.Knudson, G.W.Reynolds, F.R.Vozzo.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1285-90 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The applicability of the particle induced X-ray emission (PIXE) in the determination of sputtering distributions and yields was studied. Sputtered particles were caught on foils for the 45 keV to 125 keV selfsputtering of Fe, Ni, Cu, Ti, Mo and Au and for the 90 keV sputtering of both target and implanted particles of $Ni^{+}+Cu$, $Cu^{+}+Ni$, $Ni^{+}+Fe$, and $As^{+}+Ag$, and for the target particles of $Ar^{+}+Au$. (9 refs.)

68822 Application of in-air PIXE for corrosion-erosion studies of metal surfaces. Cheng-Ming Fou (Dept. of Phys., Univ. of Delaware, Newark, DE, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1291-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Two methods are presented to demonstrate the usefulness of in-air PIXE for studying environmental corrosion and erosion of metal surfaces. (1) Surface adsorption of corrosive vapors on gases in the ppm range is detected with the in-air PIXE technique. The adsorbed chlorine and argon can be pumped away with moderate (200°C) heating of the metal surface. Therefore such investigation can only be done with the in-air PIXE. (2) Airborne particulates with high velocity, such as sands in the desert wind, can erode metal surface. They can also imbed foreign materials into the metal surface. Those foreign materials may lead to surface corrosion. Metal surface and the glass beads of a sand-blaster, before and after sand-blasting, were examined with in-air PIXE to show its sensitivity and the ease with which it can detect minute quantities taken off or imbedded into the metal surface after just a short blasting time. (3 refs.)

68823 PIXE analysis of aerosol in the workplace. E.T.Williams, L.W.Punyasena (Dept. of Chem., City Univ. of New York, New York, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1294-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Sampling programs of relatively limited extent can be useful for monitoring suspended particulate matter in specific locations; for example certain occupational situations. Aerosol samples were collected by cascade impactors and analyzed by PIXE at the Brooklyn College Dynamitron Laboratory. The authors describe the results of experiments in a metal-sculpture studio involving silver soldering, an industrial plastics-milling shop and a municipal incinerator. (8 refs.)

68824 Proton induced X-ray studies of the shell of living oysters and of archaeological artifacts. C.P.Swann (Franklin Inst., Univ. of Delaware, Newark, DE, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1298-301 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
For a number of years the principal efforts of the author have been in collaboration with investigators in the fields of marine biology and archaeology. This report is specific to the study of the elemental composition of the shell of living oysters and to archaeological glass and faience beads and pendants and Cu-based alloy artifacts from the Middle East. It is obvious that living oysters cannot be subjected to vacuum and must not be damaged; practical aspects limit the use of vacuum for the archaeological artifacts. It is also important that the technique be multielemental in order to minimize the time required to obtain the data. All of these studies were, therefore, peformed with in-air (or helium) PIXE with a beam diameter of 0.45 mm. The results given are not final in that all of the researches are on-going and will not be completed for some months. However, the success of the technique is clearly demonstrated and some preliminary conclusions can be drawn. (8 refs.)

68825 Application of proton induced X-ray emission (PIXE) technique to gunshot residue analyses and other crime related problems. P.Sen (Saha Inst. of Nuclear Phys., Calcutta, India), G.K.Mehta.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1302-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The PIXE technique has been successfully applied to gunshot residue analyses and other crime related problems. The experimental arrangements and practical problems involved are discussed. Reproducibility and consistency checks are presented. The results demonstrate the sensitivity of the PIXE technique, its non-destructive nature, its role in determining the distance from the gun to the victim, the identification of the type of bullet used, whether a wound is made by a bullet or not and its usefulness in identification and evaluation of vital parameters related to a crime. (11 refs.)

68826 Deposition characteristics of corrosive salts in electric steam generating systems using ion beam analysis. J.G.Pronko, T.T.Bardin, I.V.Chapman, D.Kohler (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1305-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A method is described for the in situ detection of trace amounts of the isotopes contained in corrosive salts which have been deposited on the surface of metal alloys from dry steam at temperatures and pressures prevalent in nuclear steam turbine systems. The technique involves the use of ion beam induced resonant nuclear reactions with the trace elements. Detection of the resulting reaction γ-rays serves as a means of identifying and quantifying the trace element abundance deposited under given temperature and pressure conditions. Preliminary results, obtained with this technique for NaCl on metal alloys relevant to the power industry, suggest a monolayer detection sensitivity is possible. (3 refs.)

68827 Proton induced characteristic X-ray radiography. G.M.Thomson (US Army ARRADCOM Ballistic Res. Lab., Aberdeen Proving Ground, MD, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1335-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A new accelerator-based technique for measuring the densities of rapidly changing multiphase media, characteristic X-ray radiography (CXR), has been developed. It has been successfully tested in a particularly violent regime, the interior of a discharging firearm, where it has produced the first quantitative measurements of the propellant's density. The method is based upon a timewise continuous determination of the attenuation that an energetically well-defined flux of X-rays experiences as it traverses the media. (6 refs.)

68828 Trace element measurements with synchrotron radiation. A.L.Hanson, H.W.Kraner, K.W.Jones, B.M.Gordon, R.E.Mills (Brookhaven Nat. Lab., Upton, NY, USA), J.R.Chen.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1339-42 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Aspects of the application of synchrotron radiation to trace element determinations by X-ray fluorescence have been investigated using beams from the Cornell facility, CHESS. Fluoresced X-rays were detected with a Si(Li) detector placed 4 cm from the target at 90° to the beam. Thick samples of NBS Standard Reference Materials were used to calibrate trace element sensitivity and estimate minimum detectable limits for this method. (5 refs.)

68829 Application of nuclear reaction analysis to stress-induced hydrogen migration in titanium. R.L.Schulte, P.N.Adler (Res. & Dev. Center, Grumman Aerospace Corp., Bethpage, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1343-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The role of hydrogen as a cause of embrittlement and crack initiation in titanium alloys has long been recognized. However, direct experimental observation of the transport and accumulation of hydrogen in regions of high stress in titanium alloys has been sparse. The authors have applied the method of nuclear reaction analysis to the investigation of stress-induced hydrogen redistribution in Ti alloys. A 4 MV Van de Graaff accelerator is used to produce a high energy ^{7}Li ion beam to induce the ^{1}H(^{7}Li, γ)^{8}Be reaction. The measured gamma ray emission rate is proportional to the hydrogen concentration in the sample. (11 refs.)

68830 Measurement of depth distribution of phosphorus in films of phosphosilicate glass by means of ^{31}P(p,α)^{28}Si. E.Norbeck, T.Z.Ma (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1347-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Phosphorus concentrations of a few percent are studied as a function of depth in 1 μm thick films of phosphosilicate glass on silicon using the ^{31}P(p,α)^{28}Si reaction. The proton energy is 5.325 MeV. The α particles are detected at 170°. The depth resolution is better than 0.05 μm. (3 refs.)

68831 The determination of silicon, chromium and cobalt in steels by proton-induced prompt photon spectrometry. D.Gihwala, M.Peisach (Southern Univs. Nuclear Inst., Faure, S Africa).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1349-52 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Prompt γ-ray spectra from pure samples of Si, Cr and Co induced by protons between 3.5 and 6.0 MeV were used to evaluate the analytical feasibility of the method and to calculate interference-free sensitivities. The bombarding energy was selected from experimentally determined sensitivity curves and the method was tested on NBS standard steels. (12 refs.)

68832 14-MeV neutron activation analysis of complex materials. G.E.Miller, D.R.Burtner, P.A.Jerabek (Dept. of Chem., Univ. of California, Irvine, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1607-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
In principle, activation analysis of chemical samples of use of 14-MeV neutrons (Fast Neutron Activation Analysis, or FNAA) is a straightforward instrumental technique. As attempts are made to improve the accuracy and precision of the method, and to use the technique for several elements in a wider variety of samples, however, several important effects must be considered. These are categorized as instrumental, chemical, or nuclear and are examined briefly. It may be concluded that most determinations by FNAA are not 'routine' except in the case of determination of a single element in a series of closely related samples in one laboratory. (18 refs.)

68833 Application of on-line laboratory computer analysis to fast neutron activation oxygen determinations. W.D.James, M.S.Akanni (Center for Trace Characterization, Texas A&M Univ., College Station, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1610-13 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The development of an on-line laboratory computer analysis system designed for routine high volume oxygen determinations is discussed. The system is based on the detection of ^{16}N photopeaks from the ^{16}O(n,p)^{16}N reaction occurring during fast neutron irradiation. A system interface has been designed and constructed which is capable of controlling the Kaman 710 neutron generator, the sample transfer system, switching the BF$_3$ beam monitor detector or NaI(Tl) detector outputs as required to a multichannel scaling MCA, and proper sequencing of the procedure. In addition, specific software has been developed for the control of the system during acquisition as well as evaluation of the MCS spectra generated. (6 refs.)

68834 Use of thin layer activation techniques to assess mechanical parts wear. A survey of the industrial experience in France. B.Jeanneau (CEA Isotopes Applications Service, Saclay, France).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1614-18 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Thin layer activation is being used by industry for measurements of wear, erosion and corrosion. Such an activation is produced by bombardment with charged particles. The total activity level can be accurately monitored and if the activity to depth relationship is known, the amount of material worn away can thus be determined. By bombarding a given material with protons, deuterons, ^{3}He, ^{4}He, different radioactive species can be produced. Active layers can be obtained in a variety of materials such as iron, copper, chromium, titanium. The total activity level is weak, from 5 to 100 Ci but it will allow to use this technique in accordance to standard 'Radioactive Substances regulations' for industry. The active layer varies from 10 to 1000 m, the activated area from some square millimeters to 2 squares centimeters and the sample can stand still or be rotated or translated to get a band of activity. Total or worn away activity is measured. The irradiations are made with the Orleans Cyclotron and the development and applications at Saclay Laboratory. (7 refs.)

68835 Studies on polycrystalline silicon for solar applications, including characterization of trace elements B, C and Al by charged particles activation analysis. G.Blondiaux, A.Giovagnoli, M.Valladon, J.L.Debrun (CNRS, Orleans, France), J.Y.Barraud.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1619-22 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Nuclear methods of analysis were used to study the behaviour of trace elements during the metallurgy of polycrystalline silicon for solar applications: these impurities may have an influence on the efficiency of the solar photocells made out of this silicon. (4 refs.)

68836 Quantitative XRF analysis of thick samples of heavy element matrices. R.Govil, S.K.Kataria, H.N.Bajpei (Bhabha Atomic Res. Centre, Bombay, India).
Indian J. Pure & Appl. Phys., vol.20, no.12, p.969-73 (Dec. 1982). [received: April 1983]
A simple semiempirical approach for quantitative elemental analysis of thick planar samples with large absorption and enhancement effects is proposed. In this procedure, the energy-dispersive X-ray fluorescence EDXRF spectrometer and the X-ray tube exciting source are kept in fixed geometry and a number of measurements are carried out with the planar sample, making different angles with the normal to the detector. The relative intensities of the various elements with respect to one of the major constituents are extrapolated to zero effective thickness using regression analysis, and can be converted to the relative elemental concentration by an initial calibration of the system. Based on this technique two standard samples have been analyzed. The accuracy of the analysis by this technique for heavier matrices (7%) is found to be poor as compared to that for lighter matrices (3%). (9 refs.)

68837 Compositional depth profile of a native oxide LPCVD MNOS structure using X-ray photoelectron spectroscopy and chemical etching. J.A.Wurzbach, F.J.Grunthaner (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.691-9 (March 1983).
A compositional profile of a native oxide LPCVD MNOS structure has been obtained by X-ray photoelectron spectroscopy used in conjunction with a stopped-flow chemical etching procedure. A depth resolution of 5-10 Å was achieved. Stoichiometric Si$_3$N$_4$ was found in the bulk with about 0.4 atomic percent oxygen impurity. In contrast to profiles completed by other techniques, SiO$_2$ was found intact at the interface; complete conversion of oxide to oxynitride during LPCVD did not occur. The oxide/nitride interface is best described as sharp; the oxygen concentration drops by 80% in less than 8 Å. There is also a diffuse oxynitride gradient extending into the film, but the oxygen concentration in this region is quite low. Evidence was also found for an 8 Å layer containing excess bonds to silicon between the oxide and nitride layers. Possible charge trap structures that might limit device performance are discussed along with processing suggestions aimed at minimizing the formation of traps. (37 refs.)

68838 The revelation of dynamic contamination ion species and their mass characteristics in ion microprobe mass analysis. Lin Zhuoran (Inst. of Geology, State Seismological Bur., Beijing, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1209-13 (Nov. 1982). [received: April 1983]
One of the fundamental problems in ion microprobe mass analysis is the origin and mass characteristics of the interfacing ion species due to dynamic contamination. In the case of metals and semiconductors, due to insufficient SIMS mass resolution, these interfering contamination ion species always superimpose on compositional ion species and are difficult to identify. Some workers use energy filtering to suppress them to some extent but do not separate them out. In the case of a nonconductor, under positive ion bombardment which caused serious surface charging and suppression of secondary ion emission, a phenomenon completely different from that obtained under negative ion bombardment appears. The author unexpectedly finds that the interfering contamination ions can be isolated from those sputtered compositional ion species by the surface charging effect and their mass spectra can be observed. (8 refs.)

68839 Electrochemical measurement of kinetic analysis—automatic determination of trace iodine in natural waters. Wang Qingzhang, Chen Dechang (Dept. of Marine Chem., Shandong Coll. of Oceanology, Quingdao, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.12, p.1283-8 (Dec. 1982).
A great number of catalytic reactions can be converted into quite simple first-order reactions. Using the ever-expanding electrochemical technique, one can determine the reaction rates of many catalytic systems so conveniently that it will simplify procedures of analysis and computation, increase the number of measured factors, be conducive to auto-analysis, and be suitable to analysis of micro-samples. The authors present an account of the catalytic analysis of total iodine in seawater, interstitial water and artificial rain using a glassy carbon electrode and auto-potentiometer. The results obtained by electrochemical and spectrophotometric techniques are in agreement. (8 refs.)

68840 X-ray fluorescence analysis with a linear polarized beam after Bragg reflection from a flat or a curved single crystal. P.Wobrauschek, H.Aiginger (Atominst., Osterreichischen Univ., Wien, Austria).
X-ray Spectrom. (GB), vol.12, no.2, p.72-8 (April 1983).
Improvements of the detection limits in photon induced X-ray fluorescence analysis are obtained by the reduction of the radiation background using linear polarized X-rays for excitation. A single crystal where Bragg reflection

takes place at an angle $2\theta = 90°$ produces linear polarized and monochromatic X-rays. The use of a single crystal instead of amorphous scattering materials increases the intensity of the polarised beam in some cases up to a factor 10^4. The use of curved crystals instead of standard flat crystal geometries shows a further increase in the intensity of the exciting beam in the focus line. The crystals in use for both geometries are described. Detection limits are given for some elements, absolute amounts of 150 picogram can be detected in some cases. (12 refs.)

68841 Radiochemical neutron activation analysis method for the determination of chromium, cobalt and nickel in tissue samples. A.Reissell, E.-L.Lakomaa.
Report 157, Tech. Res. Centre Finland, Electr. Eng. Lab., Espoo (March 1983), 46 pp. In Finnish.
A radiochemical neutron activation analysis method for the determination of chromium, cobalt and nickel has been developed. The destruction device used consisted of a combined wet-ashing-distillation and ion-exchange system. Six samples could be treated at the same time. The samples were wet-ashed with H_2SO_4-H_2O_2 mixture. Volatile elements were distilled as bromide compounds with HBr^-. The distillation residue in 8M HC1 was passed through hydrated antimony pentoxide (HAP) in order to remove disturbing ^{24}Na-activity and through a Dowex 2×8 column so as to retain ^{60}Co and ^{58}Co (formed from ^{58}Ni). Chromium was elutriated from the column and precipitated as $Cr(OH)_3$ for the removal of disturbing ^{32}P-activity. The standards and samples were treated in a similar manner each so that the yield determination is not necessarily needed. The yields by tracer experiments were (43±5) % for Cr, (93±4) % for Co and (88±14) % for Ni. (19 refs.)

86.10 ENERGY RESOURCES AND THEIR UTILISATION

(inc. economic aspects; for nuclear engineering and nuclear power studies, see 28.00)

86.10B Fossil and other fuels

68842 Lignite (brown coal)—an important energy source at present and in the future. W.Retschke, E.Hildebrandt.
Energietechnik (Germany), vol.33, no.4, p.123-6 (April 1983). In German.
In East Germany about 60% of brown coal production is used for electricity generation and space heating, but efforts are being made to use this fuel for the production of gas and derivation of chemicals. The geological aspects of brown coal mining are surveyed. The importance of close monitoring of ash and water content when this type of coal is to be used in a power station is stressed. Because of the high combustion rate in large power stations it is most important to secure the ease and continuity of flow of materials involved in electricity generation i.e. fuel, ash, water etc., to arrange for facilities to collect and analyse representative coal samples and to remove deposits from boiler tube surfaces by water lancing or other means. To increase the overall economy of power production further uses for coal ash, in addition to the present ones which amount to about 32% of the total ash quantity, should be found. 86.10D Wind energy

68843 Possible advances in electrical energy production using wind energy and secondary cells. E.Barendrecht (Tech. Hogeschool Eindhoven, Eindhoven, Netherlands).
Elektrotechniek (Netherlands), vol.61, no.3, p.174-8 (March 1983).
If the penetration degree of electrical energy, produced from wind energy, into the electrical grid, exceeds a certain percentage, then storage is necessary. Possible systems are: pumped hydro energy storage, compressed air energy storage and advanced batteries. Advanced batteries offer certain advantages (fast response, modular system, high energy efficiency and high energy and power density) over other systems. The most promising one in this respect is the sodium/sulphur battery, of which cycle life and costs has been considerably increased, respectively lowered, last years. A systems approach must ultimately be decisive for the final choice. (9 refs.)

68844 Wind power systems and their feasibility in Hong Kong. S.Lingard, W.H.Cheng.
Hong Kong Eng., vol.11, no.2, p.51-7 (Feb. 1983).
Recent studies have indicated that wind energy can make a significant contribution towards supplying energy requirements in regions where sufficiently strong winds occur and in regions which are remote from the main power lines. The advantages of the use of wind as an alternative energy source are the renewable nature of the energy flux and the absence of harmful secondary effects. However, these are frequently more than offset by the many drawbacks, particularly the low power density and the intermittency of the wind. The contents of this article comprise some of the results of a study on the current status of wind power and the possibility of its being harnessed in Hong Kong, stimulated by a curiosity about a traditional source of mechanical power and its potential for the future. (13 refs.)

68845 Numerical study of the performance of tornado-type wind energy systems. S.S.Ayad (Mech. Engng. Dept., Faculty of Engng., Shoubra, Cairo, Egypt).
J. Energy (USA), vol.7, no.2, p.134-40 (March-April 1983).
The tornado-type wind energy system was proposed to utilize the pressure drop created by an intense vortex in a tower. The tower serves as a low pressure exhaust for the turbine. The author carried out a numerical solution of the tower flow, using the two-equation (κ-ε) turbulence model, for the small size system tested by Yen, with a 0.127-m- (5-in.-) diam. tower standing in a uniform wind flow. A comparison of the results with the measured pressure values verified the model. In the present work the same numerical model is used for a system with a tower that is completely embedded in an atmospheric boundary layer. The results show, for a tower in a boundary layer of the one-seventh power-law profile, about a 28% reduction of power coefficient from those for a tower in a uniform stream. Calculations for the performance of a system with different tower heights and the same tower and turbine diameters show a sharp decrease of power for $H/D \leq 0.5$. Analysis of the tangential velocity shows that the vortex should be maintained up to heights $z/D \leq 0.9$ to avoid the decrease in power extraction. Numerical predictions are made for systems with tower diameters between 0.5 and 8 m (1.64 and 26.64 ft) using the same system geometry and approach flow conditions. The results show that the scale effect is negligible for systems of 4-m tower diameter or larger. (11 refs.)

68846 A recursive wind data scaling algorithm. N.D.Sadanandan (Tennessee Valley Authority, Chattanooga, TN, USA), M.Sendaula, D.W.Hilson, M.E.Needham.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.462-4
Discusses a recursive wind data scaling algorithm developed to scale up wind data collected from various points over a large region. This algorithm maintains the appropriate spectral density content while preserving the temporal and spatial diversity of the wind data. This scaled up wind data was required in the synthesis and analysis of aggregate hourly generation from wind energy conversion systems (WECS), over a region the size of the Tennessee Valley, as a function of mean wind speeds. (3 refs.)

86.10F Tidal and flow energy

(inc. water-wave energy)

68847 Energy resources and vectors in West Africa. L.Gillon (Univ. Catholic de Louvain, Louvain, Belgium).
Bull. Sci. Assoc. Ing. Electr. Inst. Electrotech. Montefiore (Belgium), vol.95, no.3, p.106-17 (July-Sept. 1982). [received: March 1983]
Main energy resource of Central Africa is represented by hydraulic energy. However, the exploitation of this wealth supposes not only building power stations and related facilities, but also the construction of a large network of electrical energy transport. Moreover, large scale interconnection would allow harmonization of product of various sites whose peak production periods are shifted in time depending on climatic local cycles. Construction of such a project should be realized progressively and taking into account development depending on local distribution network extension. After having done an inventory of what already exists, the author sets forth a five-stage plan which would finally lead to creation of a very long high voltage line from Zaire to Senegal. This line would moreover complete a long electrical axis Zaire-Zambia-Zimbabwe already in the process of being built. A good opportunity therefore offered to Africa to promote an Electrical Energy Common Market which would lead, without any doubt, to promotion of the development of a large area of this continent. (no refs.)

68848 Exploitation of the riches of the sea.
Ingenieur (Netherlands), vol.95, no.4, p.16-21 (April 1983). In Dutch.
A recent study by a Netherlands scientific foundation has been examining the role which that country might play in the exploitation of marine resources. The results of the study are analysed and detailed attention is given to potential future areas of development such as tidal power stations, oil drilling, mineral extraction where Dutch marine experience could be profitably utilized. (no refs.) *R.S.*

68849 Hydroelectric power in China. H.Dickinson, I.M.Flanagan, H.W.Whittington (Dept. of Electrical Engng., Univ. of Edinburgh, Edinburgh, Scotland).
Seventeenth Universities Power Engineering Conference, Manchester, England, 30 March-1 April 1982 (Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982), 6 pp.
The capacity and generation potential of China's rivers are reviewed and the history of large and small hydropower projects is surveyed. (25 refs.)

86.10H Geothermal energy

68850 Numerical simulation of subsurface energy storage problems. P.S.Huyakorn, D.E.Dougherty, C.R.Faust (GeoTrans Inc., Reston, VA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.296-9, vol.2
In recent years the concept of seasonal storage of thermal energy in aquifers has received increasing attention. Several field experiments and numerical simulations have been conducted to determine the feasibility and economic viability of storing heated water or chilled water in selected aquifer systems. The authors describe the formulation of a quasi-three-dimensional finite element model developed to solve the governing equations for subsurface flow and energy storage problems and to present the model application to field data collected from the Stony Brook test site. (8 refs.)

86.10K Solar energy

68851 Efficiency of luminescence in luminescent solar concentrators. A.Lempicki (GTE Labs. Inc., Waltham, MA, USA).
Appl. Opt. (USA), vol.22, no.8, p.1160-4 (15 April 1983).
The power efficiency of luminescence excited by solar radiation in luminescent solar collectors is calculated for a glass sheet doped with Cr^{3+}. The achievable chemical potential for an optically thick absorber irradiated by diluted blackbody radiation as a function of Cr^{3+} concentration, sheet thickness, sunlight dilution, and luminescence quantum yield leads directly to overall conversion efficiency of solar power to luminescence power. (15 refs.)

68852 Transient analysis of a natural circulation solar water heater with a heat exchanger. M.S.Sodha, S.N.Shukla, G.N.Tiwari (Indian Inst. of Technol., New Delhi, India).
J. Energy (USA), vol.7, no.2, p.107-11 (March-April 1983).
This paper presents a transient analysis of the performance of a solar water heating system with a natural circulation of hot water between the collector and the insulated storage tank. Provision for hot water delivery for domestic/industrial uses has been made through a heat exchanger placed in the storage tank. Explicit expressions for the mean system and water delivery temperature obtained in this paper are simpler and more straightforward than those obtained numerically by Tzafestas et al., using a finite difference method, who also define an artificial heat transfer coefficient. This paper further investigates the effect of the exchanger length on the performance of the system and may help a designer to properly size the heat exchanger. Numerical calculations have been made for a typical cold day (Jan. 26, 1980) at Delhi for two modes of hot water withdrawal, namely the constant flow-rate mode and the constant water delivery temperature mode. (15 refs.)

68853 Fluorescent solar concentrators using liquid solutions. A.Filloux, J.Mugnier, J.Bourson, B.Valeur (Conservatoire Nat. des Arts et Metiers, Paris, France).
Rev. Phys. Appl. (France), vol.18, no.5, p.273-9 (May 1983).
Various aspects of fluorescent solar concentrators using liquid solutions of organic dyes are considered. No significant difference in efficiency is observed between various collector geometries. The origins of light losses are carefully examined. A method is proposed for separating the relative contribution of the dye and the matrix in the total attenuation of light. Special attention is paid to light losses by imperfect multiple reflections and by reabsorption of fluorescence photons. Attenuation lengths in collectors using a thin layer of concentrated solution are significantly longer. (20 refs.)

68854 Statistical approach to long-term performances of photovoltaic systems. B.Bartoli, U.Coscia, V.Cuomo, F.Fontana, V.Silvestrini (Istituto di Fisica, Facolta di Ingegneria, Univ. di Napoli, Napoli, Italy).
Rev. Phys. Appl. (France), vol.18, no.5, p.281-5 (May 1983).
The authors propose an analytical model able to describe long-term performances of a photovoltaic system. Such a model relates efficiency of the system with the more meaningful variables involved in the problem: system sizes and meteorological parameters. Furthermore they study the reliability of the model and the limits of its usefulness. (4 refs.)

68855 Modelling and simulation of a field of heliostats reflecting direct solar radiation onto a fixed target. J.C.Hennet (Lab. d'Automatique et d'Analyse des Systemes, CNRS, Toulouse, France).
Rev. Phys. Appl. (France), vol.18, no.5, p.287-93 (May 1983). In French.
The author presents analytical models used to simulate and to evaluate fields of focusing heliostats. For each single heliostat, flux density calculations are performed through a direct integration of a simplified convolution product. Then, shadow effects are analytically computed and individual flux contributions are summed in order to get the global map of flux on the target. (10 refs.)

68856 AM/PM: the rating system for photovoltaic modules. C.F.Gay (ARCO Solar Inc., Chatsworth, CA, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.353-61
The paper defines an approach to straightforward measures and ratings for photovoltaic modules which match the energy user's needs. The rating measurement proposed, that of electric energy delivered (Wh/day), is based on a standard solar day averaged over the year and the world, indexable according to climatological zones. This standard day sees a 24-hour average irradiance of 200 W/m^2, average temperature of 20°C. The required module measurement involves the typical peak-watt power output and sensitivity to temperature, light level, and spectral content. It then becomes possible for the energy user to estimate the cost per kilowatt-hour of electrical energy received over the life of the system. The paper illustrates the concept of and need for energy-based ratings by demonstrating various case calculations for the standard day. One commercial module type rated at 40 peak watts has an AM/PM rating of 194 Wh/day. (4 refs.)

86.10N Nuclear energy

68857 High-temperature process heat for coal gasification by nuclear means. W.Peters (Bergbau-Forschung GmbH, Essen, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1024-6 (Dec. 1982). In German.
The activities commenced in 1973/74 to make good the expected deficiency between oil and gas supplies on the one hand and demand on the other have stagnated once again. However, increased use of coal and nuclear energy is necessary in the long term. The aims of coal gasification by nuclear means are: to extend coal reserves, to reduce the effects on the environment and to reduce the costs of gas production. The paper describes various concepts of gasification and the status of projects on this process. (4 refs.)

68858 The market potential of the high-temperature reactor. K.Knizia (Vereinigten Elektrizitatswerke Westfalen AG, Dortmund, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1032-6 (Dec. 1982). In German.
It seems urgently necessary to plan the power supplies of the industrial countries in a more flexible fashion and thereby to make them less susceptible to disturbances arising externally through restrictions on fuel deliveries or price increases. The development and introduction of advanced reactors and the further development of coal processing are of prime importance in this respect. This development will lead in the long-term to the production of hydrogen with the use of nuclear energy. (no refs.)

68859 The potentialities of nuclear power engineering in solving the fuel problems. A.S.Kochenov.
Therm. Eng. (GB), vol.29, no.7, p.351-4 (July 1982). Translation of: *Teploenergetika (USSR)*, vol.29, no.7, p.2-5 (July 1982). [received: Feb. 1983]
Tables are presented and discussed showing the division of power station and industrial plant fuel consumption in the USSR between gas, oil and coal; world resources of oil and uranium; characteristics of nuclear fuel and (projected) breeder reactors; and world fuel consumption forecasts for the years 2000 and 2025. 86.30 ENERGY CONVERSION

86.30E Primary cells

68860 Primary power cells.
Electron. Prod. Des. (GB), vol.4, no.4, p.167-73 (April 1983).
Describes the relative advantages and gravimetric/volumetric energy density of the different cells available. These include zinc carbon, alkaline manganese, mercury, zinc air, lithium, and silver. (no refs.)

68861 A zinc paste primary battery. R.Jasinski, R.McCarron, G.Brilmyer (Occidental Res. Corp., Irvine, CA, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.539-42 (March 1983).
Zinc metal pastes can be electrolytically discharged in a concentrated caustic electrolyte. The ease with which a paste can be pumped is determined by the relative ratios of liquid, zinc, and a smaller particle size phase such as ZnO. These ratios are not arbitrary but are predictable via model based on the packing of spherical particles. The depth of discharge is limited in part by the original liquid content of the paste. (4 refs.)

Ionic conducting glasses of the Li_2S-GeS_2-LiI system. Their use in 'all-solid' generators with lithium anodes .... See Entry 67277

86.30F Secondary cells

68862 A lithium electrode with a zinc substrate for secondary batteries. Y.Matsuda, M.Morita, H.Katsuma (Dept. of Industrial Chem., Yamaguchi Univ., Yamaguchi, Japan).
J. Electrochem. Soc. (USA), vol.130, no.3, p.627-8 (March 1983).
The development of a lithium secondary battery using an organic electrolyte has been actively pursued in recent years. The authors show the charge-discharge characteristics of a Li electrode with a Zn substrate in propylene carbonate (PC) solution containing lithium perchlorate ($LiClO_4$) or lithium

tetrafluoroborate ($LiBF_4$). The results are briefly discussed by comparing the characteristics with those obtained on an Al substrate. (13 refs.)

68863 Plastic battery. K.Kaneto.
Solid State Phys. (Japan), vol.17, no.12, p.753-8 (Dec. 1982). In Japanese. [received: April 1983]
Electrochemistry of conducting polymers and the characteristics of a light weight, rechargeable stage plastic (polyacetylene) battery are described. (11 refs.)

68865 Proposing a new backward solar cell. K.K.Govil.
Electron. Lett. (GB), vol.19, no.10, p.395-7 (12 May 1983).
The author proposes a new backward solar cell. The reason for calling it backward is because under dark conditions it behaves as a backward diode. The main advantage of this solar cell is the higher open-circuit voltage compared to the currently used *p-n* solar cell. (12 refs.)

68866 Recent progress in amorphous silicon solar cells. Y.Uchida, H.Sakai, T.Ichimura, M.Nishiura, H.Haruki (Fuji Electric Co. Ltd., Tokyo, Japan).
Fuji Electr. Rev. (Japan), vol.28, no.4, p.116-22 (1982).
Reports on the progress of development work by Fuji Electric into commercial amorphous silicon solar cells. (10 refs.)

68867 Calculation of the efficiency of a polycrystalline gallium arsenide thin film solar cell. K.Sen, R.S.Srivastava (Dept. of Phys., DBS Coll., Dehradun, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.818-20 (Oct. 1982). [received: April 1983]
An important effect of grains in polycrystalline solar cells is to reduce the diffusion length of carriers and hence increase the dark current and decrease the short circuit current, ultimately lowering the efficiency of the cell. The authors present a simplified theory and calculations which show that efficiency for a 2 μm base thickness (H) GaAs solar cell may be of the order of 14% for grain size (D) of 10 μm. With $D>H$, the dominant current mechanism at open circuit voltage is majority carrier tunnelling, whereas for $D<H$ it is a grain-grain depletion region recombination current. (10 refs.)

68868 A flux analysis of the current-voltage characteristics of thin film frontwall illuminated and backwall illuminated liquid junction and metal junction solar cells. S.Hinckley, J.F.McCann, D.Haneman (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia).
J. Appl. Phys. (USA), vol.54, no.4, p.1955-65 (April 1983).
The flux method was used to derive analytical expressions for the photocurrent-voltage characteristics of thin film frontwall and backwall illuminated liquid junction solar cells as functions of film thickness. Expressions for these types of cells were derived without assuming the depletion layer was a minority carrier sink but with inclusion of the effects of depletion and bulk recombination, reflection, and restricted transmission at the semiconductor junction and reflection at the back contact. The effects of film thickness, donor concentration, and of partial reflection and imperfect transmission at the depletion layer/bulk layer boundary are examined. The results from this flux method are qualitatively similar to those obtained previously from different starting equations in the cases where both treatments are applicable, lending support to both approaches. In particular, the short circuit current is shown to be significantly reduced by depletion layer recombination, and by slow charge transfer when depletion layer recombination is not negligible. (29 refs.)

68869 Photovoltage decay in *p-n* junction solar cells including the effects of recombinations in the emitter. S.C.Jain, U.C.Ray (Solidstate Phys. Lab., Delhi, India).
J. Appl. Phys. (USA), vol.54, no.4, p.2079-85 (April 1983).
The expressions for the open circuit photovoltage decay in a *p-n* junction solar cell are derived, including the efects of recombinations in the emitter. It is shown that for a cell with base thickness $w_B \gg L_B$, the base diffusion length, the voltage decay rate for small values of time depends on the emitter dark saturation current J_{EO}; the larger the value of J_{EO}, the faster is the initial rate of voltage decay. For large values of time, the rate of voltage decay is solely determined by the minority carrier lifetime in the base τ_B and is independent of J_{EO}. However, for a cell with $w_B \lesssim L_B$, the voltage decay is linear from the very beginning and the decay rate is of the form $(kT/e)[(1/\tau_B)+(1/t_1)]$. The time constant t_1 is independent of τ_B. It, however, depends on the base thickness, the effective back surface recombination velocity, and the emitter dark saturation current J_{EO}. The value of J_{EO} depends on emitter thickness, front surface recombination velocity, drift field in the emitter, band-gap narrowing, and Auger recombinations in the emitter. (24 refs.)

68870 Amorphous silicon photovoltaic modules. Y.Uchida, H.Sakai, N.Furusho, M.Nishiura, H.Haruki (Fuji Electric Corporate Res. & Dev. Ltd., Yokosuka, Japan).
J. Electrochem. Soc. (USA), vol.130, no.3, p.712-16 (March 1983).
In hydrogenated amorphous silicon solar cells of 100 cm^2, the conversion efficiency of more than 6% has been obtained for the cells with metal/n-i-p/ITO/glass and ITO/n-i-p/SS structures under AM1 (100 mW/cm^2) illumination. The module structure and encapsulating materials suitable for a-Si solar cell were investigated to make a low cost module. Typical output power under AM1 illumination is 16 W for the module composed of 40 sheets of ITO/n-i-p/SS cells with 10×10 cm^2 area. The a-Si modules have been tested in various environments. The results show that the a-Si solar cells are highly resistive to high and low temperature, high humidity environments, and thermomechanical stress. (8 refs.)

68871 A survey of knowledge on the theory of MIS solar cells. M.Ruzinsky, V.Saly, S.Baratka (SVT, Bratislava, Czechoslovakia).
Slaboproudy Obz. (Czechoslovakia), vol.44, no.3, p.132-9 (March 1983).
The effects of various parameters namely the thickness of the insulating layer, the output work of the metal layer, the resistivity of the semiconductor, the surface states and the charge in the insulator, the temperature, the illumination, the lifetime of the charge minority carriers, crystallographic orientation and the energy gap on the conversion efficiency of MIS solar cells, are discussed. (20 refs.)

68872 Recent development on amorphous solar cells. S.Nitta.
Solid State Phys. (Japan), vol.18, no.1, p.52-6 (Jan. 1983). In Japanese.
Recent progress on amorphous semiconducting solar cells is reviewed from the standpoint of solid state physics. (24 refs.)

68873 Etude du couplage et de la protection des panneaux solaires a cellules photovoltaiques en vue d'obtenir de hauts voltages en courant continu (Study of the connection and protection of photovoltaic cell solar panels in view of obtaining high voltages in continuous currents). F.Forge.
Report EUR 8143 FR, Comm. European Communities, Luxembourg (1982), 43 pp. In French. Contract 718-78-12 ESF.
The objective was to establish, from measurements on real cells, a statistical distribution of the breakdown voltages of shaded cells, and hence to determine from network simulation the magnitudes of the unbalance liable to arise in accidental operating conditions (short-circuit, open-circuit and shading), and their consequences for cell behaviour. From these experimental results, various installation and protection schemes have been studied and selected in accordance with reliability and overall installation cost criteria. The results are interpreted and factors influencing inverse characteristics are discussed. The author concludes in favour of a protection diode in series with 36 cells at most.

68874 Erstellung und Tests von experimental-Solargeneratoren fur konzentrierende Systeme (Construction and testing of experimental solar generators for concentrator systems).
Report EUR 8149 DE, Comm. European Communities, Luxembourg (1982), 33 pp. In German. Contract 417-78-1 ES D.
Starting from the results of the BMFT sponsored fundamental research on silicon solar cells for concentrated sunlight, terrestrial photovoltaic experimental generators have been designed, developed and built which are suitable for integration into a 'hybrid system'. The hybrid system comprising MAN's concentrating collectors HELIOMAN and AEG-Telefunken's photovoltaic generators renders possible the system test of interacting components, which are known from separate operation. (12 refs.)

68875 Optimizing the operation of a photovoltaic generator. C.Boisvineau, J.Perard, E.Olivier (Lab. d'Electrotech., Inst. Nat. Polytech. de Grenoble, Grenoble, France).
Seventeenth Universities Power Engineering Conference, Manchester, England, 30 March-1 April 1982 (Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982), 6 pp.
Explains how to optimize the operation of a photovoltaic generator supplying a DC load through a transistor chopper. The authors present the conception of the chopper as an adaptor and a first approach to the optimal operating point, and the systematic search for the optimal operating point by a maximum power point tracking device with experimental checking of the process. (3 refs.)

68876 Matching the characteristics of batteries with solar cell modules. C.F.Gay, V.K.Kapur, B.Pyle, J.Rumburg (ARCO Solar Inc., Chatsworth, CA, USA), A.Manfredi.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.335-9
The paper puts together the characteristics of the storage battery commonly used in worldwide photovoltaic applications with those of the photovoltaic generator and of the solar source. The natural matching of these characteristics may be exploited in meeting the typical requirements of the user. If the module is properly designed, and if due care is taken in battery installation for passive temperature control, there is no need for complex regulation or periodic adjustment. A well-designed photovoltaic module can function as both generator and controller, providing enhanced system reliability, lower system cost, and simpler operation for the user. The critical design parameter, the charging voltage delivered to the battery by the module, is determined by the number of cells in the series string. (2 refs.)

68877 Calculation to improve power conversion efficiency in photovoltaic systems. A.Mas, J.Garcia, L.Closas, M.Insausti, L.Castaner (ETSITB, Barcelona, Spain).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.340-4
The paper deals with several photovoltaic system configurations in order to improve the adaptation between a photovoltaic panel and an AC load, in low power applications. Panel to battery and battery to AC load interfaces are considered and their efficiencies evaluated for each configuration. Several values of the system main parameters as battery voltages, nominal output power and others are also considered. Experimental results indicated that the panel to battery interface efficiency is substantially improved by inserting an adaptative battery interface (ABI). The behaviour of the battery to load interface for the configurations proposed is analysed. (4 refs.)

68878 Flat plate module technology—overview. E.Fabre (Photowatt Internat. SA, Rueil-Malmaison, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.346-52
The paper presents a synthetic overview of the different technologies which can be used for manufacturing a photovoltaic module. The emphasis is stressed on the cost aspect. The whole process is divided in three steps: (i) material preparation and shaping, (ii) cell processing and (iii) cell interconnection and encapsulation. The present state of the art and the general technical trends for the next few years are presented and discussed for each step, in the frame of the silicon technology. The respective contributions to the total cost are also discussed, in view of defining the general orientations for R&D which have to lead to drastic cost reduction. Once all these steps have been individually reviewed it is important to investigate the technical compatibility between all the different possible technologies in order to build up an economic and consistent process. (no refs.)

68879 Recent progress in terrestrial photovoltaic collector technology. R.R.Ferber (Photovoltaics TD&A Lead Center, Jet Propulsion Lab., Pasadena, CA, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.364-8
The US Department of Energy's photovoltaics program has as a goal the development of economic photovoltaic systems for terrestrial applications. A key element of a photovoltaic system is the collector, which converts the solar energy to electrical energy. The targeted cost for the collector is \$0.70/W_p (1980\$). Two collector concepts are being developed to meet this cost target: (1) flat-plate by the Jet Propulsion Laboratory Flat-Plate Solar Array Project, and (2) concentrator by the Sandia Laboratories. The achievement of the cost target is dependent upon the Technical Feasibility demonstration of a number of different R&D areas in coordination with industry. The current Administration R&D policy changes have impacted the program direction; however, the advances in both flat-plate and concentrator technology support the conclusions that collector R&D objectives are attainable. (no refs.)

68880 Low-cost solar array progress and plans. W.T.Callaghan (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.369-73
The flat-plate solar array project (FSA), sponsored by the US Department of Energy (DOE) and managed by the Jet Propulsion Laboratory, has achieved considerable technical progress since that reported at the Third European Communities Conference. The basic technological direction has also changed since then. Progress in the areas of silicon feedstock refinement; large-area sheet formation; flat-plate module process sequence development, and engineering and environmental testing are discussed in the context of a revised thrust developed by DOE toward higher-risk, longer-term-payoff work that emphasizes the assumption of technological risks that industrial firms are not likely to finance in the effort to develop reliable, low-cost photovoltaic modules. (no refs.)

68881 An all glass encapsulation of solar cells using silk-screening techniques. M.C.Michel (Lab. de Marcoussis, Centre de Recherche, Compagnie Generale d'Electricite, Marcoussis, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.374-6
The interest and originality of this process is threefold: glass only is used as an encapsulating material, which gives lower cost and higher reliability the making of the front contacts and the sealing of the cells are simultaneous, which reduces the number of operations the process involves a major use of screening techniques which are cheap and can be automated. The main part of the work deals with the bonding of the cells to the glass sheet. The author made modules of one or six cells. The study involves: the study of a sealing glass with mechanical, chemical, optical properties fitted to the all glass encapsulation and the fabrication of the screenable paste using this glass; the definition of the process which involves the screening of the sealing glass, the electrical contacts and the electrical connections between the cells, and which makes these three parts compatible. Properties of modules were measured before and after accelerated aging tests: the modules behaved satisfactorily after thermal cycles between −40°C and +90°C and humid conditioning cycles. Measurements of the electrical properties of encapsulated cells still show some scatter, nevertheless yields up to 12% have been achieved. (no refs.)

68882 Laminated modules with new plastic material based on an ethylene-vinylacetate copolymer. A.Desombre, J.Donon (Photowatt Internat. SA, Rueil-Malmaison, France), Y.De Zelicourt, J.C.Bobo.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.377-81
A large scale commercial production of solar modules is based on a sheet lamination process. The polymer predominantly used is a polyvinylbutyral film (PVB). The authors have made a new formulation with a copolymer of ethylene and vinylacetate including several additives. This product is more interesting than PVB for the reasons of cost and thermal properties. The basic steps of encapsulation process involved are listed. The authors have made some experimental modules which are now under long term ageing tests. (2 refs.)

68883 Design and development of a module for the EEC PV pilot plants. A.Muleo, F.Nardi, V.Paraggio (Solaris SpA, Florence, Italy).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.382-6
The modules for intermediate load applications ought to be particularly designed in accordance with higher standards and ad-hoc criteria. The module developed in this work accepts 72 cells either round, 100 mm in diameter, or square, 100 mm by 100 mm. The cells are located in a 6×12 matrix and the connections form 6 parallel strings and 4 series blocks with 3 cells per substring. This particular module delivers a current that is six times the current and a voltage that is twelve times the voltage of a single cell. Parallel interconnections (total of five) run across every substring of three cells in series. There are two main advantages of this module. The first is that it is a high current-low voltage module, better suited for large systems since mismatching problems due to the use of modules in parallel are reduced. The second is the high reliability. The paper discusses reliability, recording the behavior of the module to shadowing, short circuiting of a cell, opening of interconnections, etc. Also the design of the module has been improved by closely matching the antireflection coating to the combination of low iron glass and of encapsulant. Spectral resonse of the cells prior to encapsulation and after paneling are shown. (2 refs.)

68884 Solar cells failure modes and improvement of reverse characteristics. A.M.Ricaud.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.392-8
The growing number of large photovoltaic installations calls attention to the possible development of 'hot spots' leading to a loss of power in the best case. Catastrophic consequences on the whole array can be avoided by particular precautions taken at the cell, panel and system design level. Hot spots problems arise in modules when one or several cells become back biased and operate in the negative voltage quadrant, as a result of short-circuit current mismatch, cell cracking or shadowing. Optimization of system designs with diodes protections has already been demonstrated by France-Photon in a previous paper (1981). Further to the industrialised matching of the cells in the same module, an important result of this study is that one can improve the capability of dissipating reverse power by decreasing the shunt resistance with negligible sacrifice of the direct peak power. After a complete study of the dark direct current, the author shows for basic technology that the main parameter which governs the slope of the reverse characteristic is the shunt resistance and indicate trends to understand its fundamental causes and their relative weight for single and semicrystalline cells. (5 refs.)

68885 Fabrication on large area Cu_2S/CdS thin film solar modules. H.Huschka, B.Schurich, J.Worner (NUKEM GmbH, Hanau, Germany).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.399-403
Thin film photovoltaic generators based on the heterojunction system Cu_2S/CdS are the most developed alternative to Si solar cells. The results and experience obtained prove the Cu_2S/CdS cell to be a stable and highly reliable element with good conversion efficiencies. To demonstrate the feasibility of a large scale production a pilot plant was built by NUKEM. Most conventional methods and techniques are used for this line. It is expected that such a generator could reach the price goal which was defined for economic operations. (no refs.)

68886 Front contacts for large area high efficiency Cu_2S-CdS solar cells. W.Arndt, H.W.Schock (Inst. fuer Phys. Elektronik, Univ. Stuttgart, Stuttgart, Germany).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.404-8
Cu_2-S-CdS thin film solar cells have been fabricated by evaporating CdS onto metallized glass substrates and by forming the Cu_2S layer topotactially by a wet dip process in a solution of CuCl. The front contact is formed on the cover glass by silk screen printing, etching and electroplating techniques. The Cu_2S is contacted and encapsulated by sticking the front contact onto the Cu_2S and sealing it at high pressure and elevated temperature. Two different techniques have been used to produce the front contact: (1) A Cu foil is laminated to the cover glass by means of a hot sealing adhesive. Employing silk screen printing, etching and electroplating, the complete grid is fabricated. (2) Contact lines are directly vacuum deposited into the Cu_2S-film. The lines can be obtained employing either an aperture mask or lift-off photolithography. Bus bars are provided by the cover glass, where they have been produced according to (1). (7 refs.)

68887 Gas immersion laser diffusion: a new method for making efficient Si solar cells. G.B.Turner, D.Tarrant, D.Aldrich (ARCO Solar Inc., Chatsworth, CA, USA), R.Pressley, R.Press.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.427-31
A new method for making both p^+/n and n^+/p junction solar cells is described. A Si wafer is immersed in a transparent dopant gas and irradiated with a pulsed alexandrite laser (0.73 μm). The surface of the wafer melts for less than a microsecond and dopant from the gas is dissolved in it before epitaxial regrowth. There is no implant or deposition step and no photolysis is required so a UV laser is not needed. the technique is termed GILD, an acronym for gas immersion laser diffusion. Using PH_3 or B_2H_6 dopant, junctions were formed in 3×3 mm squares by single 200 ns, 2 J cm^{-2} pulses. By repeating the pulses at a 10 Hz rate and stepping the substrate between pulses, large areas were treated and 2×2 cm solar cells cut from them. Efficiencies of 9.2% for both p^+/n and n^+/p cells have been achieved without antireflection coating or back surface fields. The process is simple and rapid and offers significant advantages for cell production, including elimination of back etch and masking. Substrates are not heated except at the surface. (4 refs.)

68888 Study of the grain boundary effects in N-P junction polycrystalline Si solar cells. N.C.Halder (Dept. of Phys., Univ. of South Florida, Tampa, FL, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.437-42
The effects of grain boundary, such as recombination velocity, grain size, and grain orientations, have been studied on the efficiency of n-p junction polycrystalline Si solar cells. Numerical calculations have been made for the photocurrent, dark current and fill factor utilizing previously developed theory in three dimensions. The results of this study indicate that it is possible to produce an efficiency as high as 15% with fibrously grained samples of grain size 100 μm, recombination velocity 100 m/sec, and thickness 100 μm. (7 refs.)

68889 Recent advances in ITO/InP and Cds/InP solar cells. T.J.Coutts, N.M.Pearsall (School of Phys., Newcastle upon Tyne Polytech., Newcastle upon Tyne, England).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.459-63
Solar cells based on single crystal p-type indium phosphide (InP) have been fabricated by RF sputter deposition of either indium tion oxide (ITO) or cadmium sulphide (CdS). In an effort to determine the nature of these devices, the J-V characteristics have been measured and analysed under various conditions of illumination and temperature. Values of the reverse saturation current. J_o, and its activation energy have been obtained. These suggest that there may be a fundamental mechanism which limits the efficiency of ITO/InP heterojunctions to less than 10%. However, there is great potential for junctions to less than 10%. However, there is great potential for the CdS/InP cells. The variation of the quantum efficiency of the cells with wavelength has also been measured. The analyses clearly show that the substrate preparation procedure dominates cell behaviour. (2 refs.)

68890 Non linear model for shunt current in terrestrial silicon solar cells. J.Cabestany (ETS Ingenieros de Telecomunication, Barcelona, Spain).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.498-502
The circuit models commonly used for the I(v) characteristics in order to determine the equivalent circuit parameters of a solar cell fail when terrestrial textured surface solar cells are concerned with high percentage of metal covered area. Two alternatives are proposed, first is an empirical approach in which a parameter will be considered non constant and the second alternative is to include a new exponential term in the I(v) characteristic. (3 refs.)

68891 Non-linear increase and decrease of open circuit voltage of n^+-p-p^+ silicon solar cells at high illumination level. C.M.Singal, R.V.Singh (Energy Centre, Dept. of Phys., Univ. of Roorkee, Roorkee, India).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.503-10
The photovoltaic power conversion efficiency as well as the total power generation from a silicon solar cell can be increased by operating it under

concentrated sunlight. The increase of the efficiency results from an increase in the open circuit voltage of the cell under concentrated sunlight. Additional enhancement of this voltage is predicted through low high p-p^+ junnction in a solar cell haying an n^+-p-p^+ configuration. The evaluation of the voltages across the n^+-p junction (V_j) and p-p^+ junction (V_h) have been done in a self-consistent manner since the carrier concentrations and their flow in the n^+, p and p^+ regions are coupled, to one another. Further as has been recently shown by Lanyon and Tuft that there is an energy band gap shrinkage which is directly dependent upon the concentration of mobile carriers, and not on the doping concentration alone, the authors expect significant modifications in the open-circuit voltage of the cell at high illumination levels. The present analysis has been carried out incorporating the above requirements, and the developed voltages V_j, V_h and Dember potential (V_D) as well as their total voltage V_{oc}, under open-circuit conditions, have been determined for illumination levels ranging from 10^{-10} to 10^8 suns for the purpose of investigating the onset, linearity, saturation and decrease of these voltages under different illumination conditions. (9 refs.)

68892 Series resistance analysis of concentrator cells under high injection conditions. J.M.Ruiz, M.Cid, A.Vuevas, A.Luque (Inst. de Energia Solar, Univ. Politecnica Madrid, Madrid, Spain).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.511-15
Two analytical models for low and high-injection levels, respectively, and an exact model for variable injection level are used to analyze the performance of silicon solar cells with either low or high base resistivity under concentration. The ranges of applicability of the two analytical models are determined by comparison with the exact model. Specially interesting is the very good agreement observed between the exact model and the high-injection one, because both are new and constitute a simplification of previous theories. The theoretical results are that a high resistivity of the base region does not degrade the performance of the cell even at high concentration levels and that a low resistivity cell and a high resistivity cell have similar efficiencies. Experimental results are included that agree qualitatively with the theoretical predictions. (7 refs.)

68893 Passive and enhanced grain boundaries in solar cells by gas immersion laser diffusion. G.B.Turner, D.Tarrant, D.Aldrich (ARCO Solar Inc., Chatsworth, CA, USA), R.Pressley, R.Press.
Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.241-6
A new method for making p-n junctions based on immersion in a transparent dopant gas followed by irradiation with a pulsed laser is presented. The surface of the wafer melts, dopant from the gas dissolves in it, and is distributed by liquid diffusion before epitaxial regrowth. This technique, termed GILD for Gas Immersion Laser Diffusion, was used to make solar cells in both monocrystalline and polycrystalline silicon. Laser photocurrent scanning shows that grain boundary recombination is reduced or eliminated in cells made by the GILD technique and current collection is enhanced at some grain boundaries. Heat treatment at 850°C prior to GILD causes the same grain boundaries to be recombination active as they are in ordinary diffused cells. (3 refs.)

68894 Accelerated reliability testing of encapsulated solar cells. F.White, J.W.Lathrop (Clemson Univ., Clemson, SC, USA).
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.453-6
Various types of encapsulation systems with electrically biased solar cells were subjected to an environment of 85°C and 85% relative humidity. The encapsulation systems have been categorized into three groups: bare cells, hermetic substrates, non-hermetic substrates. The non-hermetic substrates degraded worst while the hermetic substrate cells degraded least. The measurement techniques and one test used to determine reliability are discussed. The results of the test are then used to analyze a possible degradation mechanism. (4 refs.)

Results are presented on the local heat fluxes in the channel of the U-25B MHD generator. The design of the channel is described along with the methods of making the measurements. Data have been obtained on the distribution of the heat fluxes at various parts of the channel under conditions of strong electromagnetic interaction. The effects of various factors characteristic of MHD channels are examined.

68896 Temperature distribution in anisotropic thermoelements. A.G.Samoilovich, O.Yu.Shevchuk (State Univ., Chernovtsy, USSR).
Sov. Phys.-Semicond. (USA), vol.16, no.11, p.1260-2 (Nov. 1982). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.16, no.11, p.1951-4 (Nov. 1982). [received: April 1983]
A method is developed for the determination of the temperature distribution in anisotropic thermoelectric generators and cooling units made of materials with temperature-independent transport coefficients and subjected to a constant internal electric field. This makes it possible to study more fully the energetics of such devices. The results are given of a calculation of the distribution of the Bridgman heat and of eddy thermoelectric currents in an anisotropic thermoelectric generator. (6 refs.)

68897 Metal oxidation as a heat pump. D.Cubicciotti (Electric Power Res. Inst., Palo Alto, CA, USA).
J. Electrochem. Soc. (USA), vol.130, no.3, p.729-30 (March 1983).
The oxidation of a metal is generally an exothermic process, and the rate of heat release is slow enough in most cases that the detailed location of the site of heat evolution is not important. During a rapid oxidation, however, it is interesting to consider the detailed processes of heat generation. During the rapid oxidation of zirconium, there should be a temperature gradient through the thickness of the oxide. The metal side should be cooler than the gas side of the oxide. If the zirconium were in a fast flowing stream of gas which could effectively remove the heat pumped through the oxide layer to the oxide-gas surface, then the substrate metal would be cooled by the oxidation process and the temperature of the metal would fall below its initial value. (5 refs.)

68898 High-temperature heat pump. R.Pitt (Lehrstuhl & Inst. fur Dampf- & Gasturbinen, Rheinisch-Westfalischen-Tech.-Hochschule, Aachen, Germany).
Brennst.-Waerme-Kraft (BWK) (Germany), vol.35, no.1-2, p.30-5 (Jan.-Feb. 1983). In German.
In order to produce liquid or gaseous chemical raw materials and fuels from coal and water, process heat must be employed. The temperature in the described heat pump is increased by addition of electrical energy. The effects of its application on the steam-coal-gasification process and on the process of water decomposition, namely high-temperature steam phase electrolysis, are introduced. The principle of the high-temperature heat pump and examples of application and necessary development efforts are discussed in detail. (10 refs.)

68899 Stored chemical energy propulsion system for underwater applications. T.G.Hughes, R.B.Smith, D.H.Kiely (Pennsylvania State Univ., University Park, PA, USA).
J. Energy (USA), vol.7, no.2, p.128-33 (March-April 1983).
An underwater propulsion system that couples a lithium fuelled boiler with a standard Rankine cycle has been developed and demonstrated in an ocean environment. Although the demonstration vehicle was a small diameter axisymmetric body, other configurations have been subjected to study and experimentation. Various fuel-oxidizer combinations have been considered for use in the system, and these are examined along with the necessary supporting technologies for future development efforts. A brief history of the system development is included. It is concluded that the described system has been

shown to be a viable candidate for numerous underwater applications. (15 refs.)

68900 Feasibility assessment of customer-side-of-the-meter applications for battery energy storage. W.J.Stolte.
Report EPRI-EM-2769, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 110 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Describes an investigation of the important techno-economic factors for customer-owned battery energy storage plants. Battery storage system designs and costs are described and quantified, and the most current rates and customer load profiles are used for a range of generic applications to obtain an economic analysis. A baseline application is described and evaluated, and the parametrically varied cost and performance parameters used to determine the sensitivity of the results are discussed.

86.40K Hydrogen storage and technology

68901 High-temperature process heating for thermo-chemical hydrogen fission. K.F.Knoche (Lehrstuhl fur Tech. Thermodynamik, RWTH, Aachen, Germany).
VGB Kraftwerkstech. (German Ed.) (Germany), vol.62, no.12, p.1030-1 (Dec. 1982). In German.
Hydrogen is likely to be the most important energy source in the next century. Numerous investigations have demonstrated the special advantages of hydrogen as a fuel or for a wide range of applications in the chemical industry. At the present time of course the high additional costs in comparison with natural gas outweigh these advantages. First, the application of nuclear power from high-temperature reactors has made hydrogen production economic, Basic research undertaken to date has indicated that thermo-chemical water disintegration processes offer numerous posibilities for improvements in technical processes. (no refs.)

68902 Water electrolysis for hydrogen production. H.Vandenborre (Studiecentrum voor Kernenergie, Mol, Belgium).
Elektrotechniek (Netherlands), vol.61, no.3, p.166-71 (March 1983).
Economic competition among different hydrogen production processes is changing due to the increasing cost of fossil raw materials as naphta and natural gas. State-of-the-art and advanced R and D programmes for hydrogen production by water electrolysis are given. Cost analysis are related to the use of off-peak nuclear electricity for the electrolysis process. (17 refs.)

68903 Particle-size distribution and phosphorus levels in soil, sediment, and urban dust and dirt samples from the Menomonee River watershed, Wisconsin, USA. A.Dong, G.V.Simsiman, G.Chesters (Dept. of Soil Sci., Univ. of Wisconsin, Madison, WI, USA).
Water Res. (GB), vol.17, no.5, p.569-77 (1983).
Soil, bottom sediment, and urban street dust and dirt samples from the Menomonee River Watershed, Wisconsin, were dispersed by ultrasound, fractionated and analyzed for the P content each of three particle-size fractions. The major soil types in the watershed were used as a reference for comparing particle-size distribution and P content in urban street dust and dirt, and in sediments. (17 refs.)

68904 Mercury and chlorinated hydrocarbons in sediments from the Bay of Naples and adjacent marine areas. F.Baldi, R.Bargagli, S.Focardi, C.Fossi (Univ. di Siena, Siena, Italy).
Mar. Pollut. Bull. (GB), vol.14, no.3, p.108-11 (March 1983).
The authors report the distribution of mercury, pesticides and PCBs in superficial sediments and a sediment core obtained in July 1980 from the Bay of Naples and adjacent marine areas from 40° 20′ to 41° 20′ N. (14 refs.)

68905 Mine-derived metal pollution in the Isle of Man. T.Southgate, D.J.Slinn, J.F.Eastham (Dept. of Marine Biology, Univ. of Liverpool, Port Erin, Isle of Man).
Mar. Pollut. Bull. (GB), vol.14, no.4, p.137-40 (April 1983).
The sediments of rivers draining areas of past mining activity in the Isle of Man contained greatly enhanced levels of zinc, lead and, to a lesser extent, copper and cadmium. This contamination extended into the estuarine harbours where it was reflected in the metal content of four species of bivalve molluscs. Of the latter, Mytilus edulis was the most useful indicator species in that it occurred in all five estuarine harbours but Scrobicularia plana, although of more limited distribution, concentrated much higher levels of zinc and lead. Individual variation of metal levels was high in all species of bivalves examined; a negative correlation of dry weight:metal content was demonstrated in many cases, but other factors may also contribute to such variation. (20 refs.)

68906 Accumulation of mercury in fish and man from reservoirs in northern Finland. M.Lodenius, A.Seppanen, M.Herranen (Dept. of Environmental Sci., Univ. of Helsinki, Helsinki, Finland).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.3, p.237-46 (April 1983).
Samples of fish and human hair have been analyzed for Hg content. The concentrations of Hg in fish from man-made lakes were higher than in fish from a background (natural) lake. Fish of prey, burbot (Lota lota) and pike (Esox lucius) contained more Hg (max 2.0 mg kg^{-1}) than other species of fish and higher values were recorded in the flesh than in the liver. In the Porttipahta reservoir the Hg content of burbot and pike exceeded the Finnish safety limits of 0.5 and 1 mg kg^{-1}. In samples of human hair there was also a clear difference between persons living near man-made lakes (mean 4.9 mg kg^{-1}) and background (mean 1.6 mg kg^{-1}) areas. The highest concentrations (about 30 mg kg^{-1}) were found in hair samples from middle-aged people eating substantial amounts of fish from reservoirs. The concentrations were higher in males than in females probably caused by a higher fish consumption. (50 refs.)

68907 Modeling thermal plumes in tidal rivers. J.Hauser, D.Eppel, M.Lobmeyr, A.Nehlsen, A.Muller (Inst. fur Phys., GKSS-Res. Center, Geesthacht, Germany), F.Tanzer.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.270-3, vol.2
The assessment of possible detrimental effects of pollutant discharges by power plants, industrial sites and municipalities on the aquatic life is a vital task. From the standpoint of environmental protection it is desirable to predict any effects on the ecosystem before a power plant or industrial site is constructed. Hence mathematical modeling plays an important role in simulating the behavior of environmental systems. The paper is concerned with pollutant propagation in tidal rivers, bays or estuaries. Emphasis is on reliability, accuracy and verification of simulation models. The mathematical formulation and the numerical solution of the resulting system of ordinary differential equations is only briefly outlined. Numerous examples are given to exemplify possible pitfalls and how to get around these difficulties. All examples are compared with measured field-data. Since the measurements carried out were mainly concerned with the determination of thermal plumes, the mathematical calculations simulate the spread of these plumes. However, the model along with the mathematical formulation is not restricted to thermal propagation but allows the computation of any pollutant concentration, provided the proper source and sink terms are specified. (20 refs.)

68908 New application of dependence between mean times of sampling and maximal air pollutant concentrations. S.L.Doychinov (Sofia Univ., Sofia, Bulgaria).
C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.12, p.1681-4 (1982).
The destructive action of air pollutants on monuments of architecture and arts is becoming ever more tangible in contemporary ecological conditions. Most exposed to it are frescos, which are particularly vulnerable to SO_2, oxidants, metal aerosols and dust. SO_2 catalytically oxidizes to SO_3 and after hydrolysis forms H_2SO_4, which destroys the pigment layer and the carbonate base of frescos. Oxidants, which are a mixture of active oxidizing agents, attack the pigment layer and the organic components of frescos, while metal aerosols catalyze different processes in the atmosphere and on the pictorial layer. For instance, Fe, Mn, Cu, Zn, Al, etc., oxidize SO_2 to SO_3. Dust is an excellent contact surface for catalytic processes in the atmosphere. Two of Bulgaria's most valuable monuments of culture, located in quite different surroundings, were chosen as models in the author's investigations: Boyana Church, proclaimed by UNESCO as a monument of world significance and lying 8 km south of Sofia, and St. Petka Samardjiyska Church, which is situated in the city centre. (10 refs.)

68909 Methane flux across the air-water interface: air velocity effects. D.I.Sebacher, R.C.Harriss, K.B.Bartlett (NASA Langley Res. Center, Hampton, VA, USA).
Tellus Ser. B (Sweden), vol.35B, no.2, p.103-9 (April 1983).
Methane flux from the air-water interface of freshwater-covered wetland ponds is shown to increase approximately as the square of the air velocity over the water surface. CH_4 fluxes were measured using a partitioned chamber placed over the water surface where the air velocity along the surface can be controlled. Correlating measurements of CH_4 fluxes and surface water dissolved CH_4 concentrations to air velocities provide a means to evaluate the liquid phase exchange coefficient for a two-layer model of the gas-liquid interface. The liquid phase exchange coefficient for CH_4 is calculated for air velocities of zero and for air velocities from 1.4 to 3.5 m s^{-1} and water temperatures of 20°C. (30 refs.)

68910 Atmospheric balance of sulphur above an equatorial forest. R.Delmas (Dept. de Phys., Faculte des Sci. d'Abidjan, Abidjan, Ivory Coast), J.Servant.
Tellus Ser. B (Sweden), vol.35B, no.2, p.110-20 (April 1983).
The atmospheric sulphur balance over the humid tropical forest of the Ivory Coast is studied over a 1-year period. A box model limited by the monsoon

layer between the coast of the Gulf of Guinea and the savannah is used. The sulphur compounds considered are gaseous H_2S and SO_2 and particulate $SO_4^{=}$. Chemical criteria are used to differentiate the $SO_4^{=}$ of atmospheric, oceanic, soil-derived and plant origins. The sulphur compounds are measured in the air and in the rain-water at 2 stations, one at the box entry (Adiopodoume) and the second at the exit (Lamto). (19 refs.)

68911 Seasonal variations of Cd, Pb, Cu and Ni levels in snow from the eastern Arctic Ocean. L.Mart (Chem. Dept., Inst. of Appl. Phys. Chem., KFA, Juelich, Germany).
Tellus Ser. B (Sweden), vol.35B, no.2, p.131-41 (April 1983).
During the Swedish Arctic expedition 'Ymer 80' into the area from North Greenland to Franz-Josef-Land in late summer 1980, freshly fallen snow, and snow from the previous fall/winter season were collected from ice floes. Lead, cadmium and copper analysis was performed on board ship, using the advanced voltammetric determination method of differential pulse anodic stripping voltammetry at rotating glassy carbon electrodes. The analytic operations were performed under a clean room container. Nickel, and tentatively, cobalt levels were analyzed in a laboratory by differential pulse voltammetry after preconcentration by chelate adsorption at a hanging mercury drop electrode. (37 refs.)

68912 Mathematical modeling of cooling tower plumes. R.Carhart (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA), A.Policastro.
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.274-6, vol.2
The vast majority of mathematical models used to predict plume rise from natural-draft (NDCT) and mechanical-draft (MDCT) cooling towers employ the integral approach. The following significant areas of controversy which exist in the theoretical development of such models: assumptions needed to assure the proper balance between buoyancy and momentum transfer mechanisms; (b) treatment of thermodynamics; (c) treatment of tower downwash; (d) treatment of atmospheric diffusion, and (e) proper method for merging of plumes. The most successful models employ assumptions which appear physically reasonable with calibration of unknown coefficients with field and/or laboratory data. Such models are capable of predicting visible plume rise within a factor of 2 and visible plume length within a factor of 2.5 for 50-75% of most new field cases. Such accuracy is sufficient for most design and environmental impact evaluations. Only the ANL and KUMULUS Models of this better-performing group are sufficiently general, however, to handle any configuration of NDCTs and MDCTs. (4 refs.)

68913 Monitoring aerosol elemental composition in particle size fractions in case of long-range transport. P.Metternich, H.-W.Georgii, K.O.Groeneveld (Johann Wolfgang Goethe-Univ., Frankfurt/Main, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1282-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Collection of atmospheric samples was performed at Malta, a semi-remote environment in the Mediterranean, in case of long-range transport studies of pollutants and natural substances. Using PIXE as a non-destructive trace-element analytical tool, the elemental composition of these samples was determined. Atmospheric concentrations obtained in this study were of one magnitude higher than those observed over the open North Atlantic in purely marine air. For most of the anomalously enriched elements in the Mediterranean aerosol, the high concentrations can be explained by long-range transport. (17 refs.)

68914 Use of sulphur hexafluoride in atmospheric diffusion tracing. Li Shikui (Central Meteorological Bur., Beijing, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1191-2 (Nov. 1982). [received: April 1983]
Mid-range atmospheric diffusion is one of the most important problems of pollution meteorology. In the last decade, the development and application of SF_6 tracing techniques have provided a new effective method for mid-range atmospheric diffusion studies. Its tracing range is from several kilometres to over a hundred kilometres. The author has made more than thirty field diffusion experiments using the SF_6 tracing technique to simulate diffusion of pollutants from elevated sources along a coastal area as well as in a mountain valley. 68915 DNA and protein lattice-lattice interactions in the filamentous bacteriophages. C.J.Marzec, L.A.Day (Public Health Res. Inst., New York, NY, USA).
Biophys. J. (USA), vol.42, no.2, p.171-80 (May 1983).
The relations between the protein coats and DNAs of the four filamentous bacteriophages fd, Xf, Pfl, and Pf3 are considered. These viruses have similar morphologies, yet show a diversity of detailed structure, having different protein coat symmetries (helical and rotational), different coat protein sizes (44-50 amino acids per subunit) and sequences, different nucleotide axial translations (2.3-5.5 Å), and different ratios of nucleotides per coat protein subunit (integers 1.0 and 2.0, and nonintegers ~2.4). These divergences are all reconciled quantitatively by means of two theoretical concepts: the pitch connection and the restricted pitch connection. The pitch connection relates protein and DNA surface lattices with arbitrary, nonintegral nucleotide/subunit ratios in a nonrandom way. The retricted pitch connection selects a preferred set of n/s values. Both relations are derived formally in a mathematical appendix. The available structural data are explained, including the fd DNA pitch indicated by X-ray diffraction photos and the similar DNA morphologies of Xf and fd. Predictions are made for the existence of nonclassical inverted DNA structures (I-DNA) in Pf1 and Pf3. (26 refs.)

68917 Organization of calcium pump protein dimers in the isolated sarcoplasmic reticulum membrane. C.A.Napolitano, P.Cooke (Univ. of Connecticut, Farmington, CT, USA), K.Segalman, L.Herbette.
Biophys. J. (USA), vol.42, no.2, p.119-25 (May 1983).
The arrangement of the calcium pump protein in the isolated sarcoplasmic reticulum (SR) membrane was examined by optical diffraction of freeze-fracture electron micrographs. Several states of protein particle organization were observed: random, hexagonal and tetragonal packing, and a mixture of hexagonal and tetragonal packing. This suggests that the time-averaged positions of protein particles in the plane of the SSR membrane are weakly defined. In addition, there appears to be a greater degree of local or short-range order compared to long-range order within the field of freeze-fracture particles. The authors utilized mesurements from tetragonally or hexagonally packed arrays to determine a unit cell area occupied by each freeze-fracture particle and its associated lipid matrix. When these unit cell areas and the stereologically determined area per freeze-fracture particle were compared to the cross-sectional area occupied by a single calcium pump protein and its associated lipid, obtained by X-ray and neutron diffraction methods, the authors concluded that each freeze-fracture particle probably represents a dimer of pump protein molecules in the plane of the SR membrane. (38 refs.)

68918 Thermodynamic properties of the lipid bilayer transition. Pseudocritical phenomena. S.Mitaku, T.Jippo, R.Kataoka (Dept. of Material Systems Engng., Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).
Biophys. J. (USA), vol.42, no.2, p.137-44 (May 1983).
Ultrasonic relaxation of multilamellar liposomes formed from dipalmitoylphosphatidylcholine was measured near the gel-to-liquid crystal transition by a differential ultrasonic resonator. The relaxation times and strength increased remarkably near the transition temperature, indicating a pseudocritical phenomenon. A quantitative analysis of the relaxation in terms of thermodynamic relationships between specific heat, thermal-expansion coefficient, and compressibility showed that more than 90% of the total endothermic heat of the transition arises from the latent heat. The temperature dependence of the ultrasonic relaxation parameters was also analyzed by the Landau theory; the authors obtained a small but finite difference, 0.6°C, between the pseudocritical temperature and the transition temperature. These results provide a quantitative description of both the first-order and second-order characters of the gel-to-liquid crystal transition. (42 refs.)

68919 The molecular symmetry of glutaminase-asparaginases: rotation function studies of the Pseudomonas 7A and acinetobacter enzymes. H.L.Ammon, K.C.Murphy (Dept. of Chem., Univ. of Maryland, College Park, MD, USA), L.Sjolin, A.Wlodawer, J.S.Holcenberg, J.Roberts.
Acta Crystallogr. Sect. B (Denmark), vol.B39, pt.2, p.250-7 (1 April 1983).
The molecular symmetry of crystalline Pseudomonas 7A glutaminase-asparaginase (orthorhombic, $P2_12_12_1$, a=118.0, b=131.2, c=85.1 Å), which contains one 139000 g mol^{-1} tetramer per asymmetric unit, has been studied with Patterson rotation techniques. The results are completely consistent with 222 point-group symmetry. The relative orientations of the crystalline Acinetobacter glutaminase-asparaginase (orthorhombic, $I222$, a=96.7, b=112.4, c=70.9 Å), which contains one subunit per asymmetric unit, and the Pseudomonas 7A enzyme have been established with the so-called locked and cross-rotation functions. The presence of 222 symmetry in these tetramers is consistent with several previous investigations of the asparaginases. (36 refs.)

68920 Perturbation of the hydrogen-bond equilibrium in nucleic bases. An infrared study. R.Buchet, C.Sandorfy (Dept. de Chimie, Univ. de Montreal, Montreal, Quebec, Canada).
J. Phys. Chem. (USA), vol.87, no.2, p.275-80 (20 Jan. 1983).
The ways in which the hydrogen-bond equilibrium can be perturbed in the 1-cyclohexyluracil (CU) dimer and in the 1-cyclohexyluracil/9-ethyladenine (EA) complex have been examined by infrared and proton NMR spectroscopy. The perturbers used were high concentrations of halofluorocarbon anesthetics containing an acidic hydrogen like chloroform, halothane, methoxyflurane, and enflurane and barbiturates like phenobarbital (PB). It is shown that these perturbers are capable of opening a large proportion of the hydrogen bonds present in these base pairs. The effect of phenobarbital is particularly spectacular. The possible biological importance of these observations is stressed. (24 refs.)

68921 Molecular orbital study of the protonation of DNA bases. J.E.Del Bene (Dept. of Chem., Youngstown State Univ., Youngstown, OH, USA).
J. Phys. Chem. (USA), vol.87, no.2, p.367-71 (20 Jan. 1983).
Ab initio SCF calculations with the STO-3G basis set were performed to determine the optimized structures of the neutral and protonated DNA bases, thymine, cytosine, adenine, and guanine. Single-point Hartree-Fock calculations at these geometries were then carried out with the split-valence 4-31 G basis set to obtain the protonation energies. Protonation led to significant geometrical changes in the base, particularly in bond lengths and angles near the protonation site. Charge transfer to the proton occurred and was accompanied by polarization of electron density of the base toward the protonation site. (26 refs.)

68922 Structure of the influenza virus glycoprotein antigen neuraminidase at 2.9 Å resolution. J.N.Varghese (Div. of Protein Chem., CSIRO, Parkville, Victoria, Australia), W.G.Laver, P.M.Colman.
Nature (GB), vol.303, no.5912, p.35-40 (5 May 1983).
The influenza virus neuraminidase glycoprotein is a tetramer with a box-shaped head, 100×100×60 Å, attached to a slender stalk. The three-dimensional structure of neuraminidase heads shows that each monomer is composed of six topologically identical β-sheets arranged in a propeller formation. The tetrameric enzyme has circular 4-fold symmetry stabilized in part by metal ions bound on the symmetry axis. Sugar residues are attached to four of the five potential glycosylation sequences, and in one case contribute to the interaction between subunits in the tetramer. (52 refs.)

68923 Structure of the catalytic and antigenic sites in influenza virus neuraminidase. P.M.Colman, J.N.Varghese (Div. of Protein Chem., CSIRO, Parkville, Victoria, Australia), W.G.Laver.
Nature (GB), vol.303, no.5912, p.41-4 (5 May 1983).
The catalytic sites of influenza virus neuraminidase are located on the upper corners of the box-shaped tetramer that forms the head of the molecule. Antigenic determinants form a nearly-continuous surface across the top of the monomer encircling the catalytic site. Approximately the same number of amino acid sequence changes occurred in these determinants between the years 1968 and 1975 as occurred in the antigenic sites of influenza virus haemagglutinin in the same period. (25 refs.)

68924 Structure of trimeric haemerythrin. J.L.Smith, W.A.Hendrickson (Naval Res. Lab., Washington, DC, USA), A.W.Addison.
Nature (GB), vol.303, no.5912, p.86-8 (5 May 1983).
X-ray crystallography has been used to study the subunit structure of trimeric haemerythrin from a Siphonosoma species. It is reported that the pattern of intersubunit helix-helix interactions differs from the most common mode of association of other helix-bundle proteins. In a novel approach to structure analysis at low resolution, experimental phases for the structure determination were based on anomalous scattering from the iron atoms native to haemerythrin, using the new resolved-anomalous phasing procedure. 68925 Heavy ion induced desorption of biomolecules: dependence on the heavy ion parameters. H.Voit, H.Frohlich, P.Duck, B.Nees, E.Nieschler, W.Bischof, W.Tiereth (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1759-61 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
High energy heavy ions (MeV/amu) from an accelerator or a fission source are able to desorb atoms and ions from dielectric solids (alkali halides, condensed gases, organic compounds) with desorption yields comparable to low energy sputtering yields. This high energy desorption has important applications in the mass spectroscopy of thermally labile biomolecules since large molecules can be desorbed as a whole with large probability. The authors study the dependence of the desorption yield for the amino acid valine on parameters of the primary ions like energy, mass and charge state q. They use different heavy ions from an EN tandem accelerator and a time-of-flight mass spectrometer in order to analyse the desorbed molecular ions. (4 refs.)

68926 Infrared study of trapped carbon dioxide in thermally treated apatites. S.E.P.Dowker, J.C.Elliott (Dept. of Biochem., London Hospital Medical Coll., London, England).
J. Solid State Chem. (USA), vol.47, no.2, p.164-73 (April 1983).
The formation of molecular CO_2 in synthetic apatities (prepared in aqueous systems), dental enabel, dentine, and various apatitic rock phosphates after heating in the range 120-900°C has been investigated by infrared spectroscopy. The CO_2 band at 2340 cm^{-1} was observed in the synthetic samples, enamel, and some of the rock phosphates, but not in dentine or bone. It is suggested that the absence of this band in dentine and bone is caused by the small crystal size of their apatites. The CO_2 band at 667 cm^{-1} was never observed. The polarized infrared spectrum of heated dental enamel showed that the linear CO_2 molecules were either randomly oriented or oriented so that the length of the molecules made an angle of about 56° with the c axis. It is suggested that, if the latter is correct, the CO_2 originates from a CO_3^{2-} ion which occupied the sloping face of the phosphate ion site. (40 refs.)

68927 Fourier transform infrared difference spectra of intermediates in rhodopsin bleaching. K.J.Rothschild, W.A.Cantore, H.Marrero (Dept. of Phys. & Physiology, Boston Univ., Boston, MA, USA).
Science (USA), vol.219, no.4590, p.1333-5 (18 March 1983).
The membrane protein rhodopsin is the primary light receptor in vision. Fourier transform infrared difference spectroscopy is sensitive to conformational changes in both the protein and the retinylidene chromosphore of rhodopsin. By blocking rhodopsin bleaching at specific intermediates, it is possible to elucidate some of the primary molecular events of vision. (25 refs.)

87.16 BIOTHERMICS

68928 Role of surface area-to-mass ratio and work efficiency in heat intolerance. Y.Epstein, Y.Shapiro, S.Brill (Heller Inst. of Medical Res., Chaim Sheba Medical Center, Tel-Hashomer, Israel).
J. Appl. Physiol. (USA), vol.54, no.3, p.831-6 (March 1983).
Fourteen postheatstroke (*HS*) subjects and nine normal control subjects (*C*) with similar ($\dot{V}_{O2\ max}$) underwent a 180-min heat-tolerance test (ambient temperature 40°C, relative humidity 40%; 12 $steps.min^{-1}$ on a 30-cm high bench). In group *HS* nine subjects (*NHS*) thermoregulated similar to group *C*, while five subjects were identified as heat intolerant (*HI*), characterized by significantly higher heart rate (HR), rectal temperature (T_{re}), and heat storage (ΔS) than groups *NHS* and *C*. The work efficiency (η) was significantly lower in groups *HI* and *NHS* when compared with *C*. Skin surface area-to-body mass ratio (A_D/W) in group *HI* was significantly lower than in group *NHS* or *C*. Multiple regression analysis between each one of the dependent variables, HR, T_{re}, and ΔS, mean weighted skin temperature, and sweat rate, against the two independent variables, η and A_D/W, yielded significant correlations. The results suggest that a reduced η and/or a reduced A_D/W play a role in heat intolerance, causing increased heat production and a concomitantly less effective heat dissipation. (23 refs.)

68929 Calorimetry and psiumetry. A.I.Zotin (Inst. of Dev. Biology, Acad. of Sci., Moscow, USSR), I.H.D.Lamprecht.
J. Non-Equilibrium Thermodyn. (Germany), vol.7, no.6, p.323-38 (1982).
In many biologic processes such as development, growth and aging, differences occur when energy turnover is measured by direct or by indirect calorimetry. The theory is presented showing that part of the dissipative energy (psiu-function) is stored inside the organism and is not dissipated to the environment. According to the theory of minimum entropy production in a steady state, the psiu-function vanishes when the organism is approaching a steady state of metabolism. Examples are given for the slope of the psiu-function in oogenesis, embryonic development, growth of animals and microbial cultures and for the dependence of the psiu-function on body weight. 87.20 MEMBRANE BIOPHYSICS

68930 Effect of concentric multilamellae on the depolarized light scattering from phospholipid vesicles. K.Mishima (Dept. of Phys., Sophia Univ., Tokyo, Japan).
Chem. Phys. Lett. (Netherlands), vol.96, no.5, p.552-4 (22 April 1983).
An expression of the depolarization ratio is presented for multilayered spherical shells using the Rayleigh-Gans theory of light scattering. The effect of multilamellar bilayers of a phospholipid vesicle on the depolarization is investigated numerically. The depolarization ratio decreases markedly with increasing number of bilayers. (8 refs.)

68931 Photoelectrochemical observations on chlorophyll-carotene interactions in a lipid bilayer film. T.Miyasaka, K.Honda (Dept. of Synthetic Chem., Faculty of Engng., Univ. of Tokyo, Tokyo, Japan).
Thin Solid Films (Switzerland), vol.102, no.2, p.173-85 (15 April 1983).
Photoelectrochemical investigations were undertaken on energy transfer and other interactions between chlorophyll-a (Chl-a) and β-carotene (Car) in lipid monolayers. A heterobilayer composed of a Chl-a-lecithin monolayer and a Car-lecithin monolayer was prepared on an SnO_2 semiconductor electrode by Langmuir-Blodgett techniques. When the bilayer-coated electrode was irradiated in an aqueous electrolyte, anodic photocurrents due to the sensitizations by Chl-a and Car respectively were observed. The photocurrent efficiency (ratio of photons to electrons) was much lower for Car (about 10^{-3}) than for Chl-a (about 10^{-1}). This large difference permits a quantitative estimation of the energy transfer from Car to Chl-a, based on the concept that the energy transfer results in an increase in the Car-induced sensitized photocurrent. The effect of added Chl-a on the Car photocurrent was measured for heterobilay-

ers with various Chl-a-to-Car molar ratios. The experimental results, as well as theoretical calculations, showed that the Car-to-Chl-a energy transfer is inefficient. The effect of Car on the Chl-a-sensitized photocurrent was also studied with the same bilayer system. The effect was shown to be complex depending on the Car content. A lowering of the Chl-a photocurrent occurred at high Car contents, which is considered to reflect the quenching of the Chl-a excited triplet by Car. The usefulness of the present photoelectrochemical approach for the study of energy transfer between the photosynthetic pigments is demonstrated. (29 refs.)

87.25 CELLULAR BIOPHYSICS

68932 Theory of the electrokinetic behavior of human erythrocytes. S.Levine, M.Levine, K.A.Sharp, D.E.Brooks (Dept. of Pathology, Univ. of British Columbia, Vancouver, BC, Canada).
Biophys. J. (USA), vol.42, no.2, p.127-35 (May 1983).
Presents a theory of electrophoresis of human erythrocytes that predicts mobilities significantly smaller than those based on the classical Smoluchowski relation. In the classical treatment the charge is assumed to be spread uniformly on the hydrodynamic surface. The present model takes into acount that most of the charge, due mainly to sialic acid, is contained in the glycocalyx. The glycocalyx is modeled as a permeable layer of polyelectrolyte molecules anchored to the cell membrane. The charge is assumed to be uniformly distributed throughout this layer. The fluid flow in the layer is treated as being dominated by Stokes friction arising from idealized polymer segments. The Navier-Stokes equations are solved to give the dependence of electroosmotic velocity with distance from the cell surface. An expression for the electrophoretic mobility is obtained which contains two parameters (*a*) the thickness of the glycocalyx and (*b*) the mean polymer segment radius. The best fit to experimental data is obtained if these are given the values 75 Å and 7 Å, respectively. Deviation from experimental data at low ionic strength (<0.05 M) occurs. However, this deviation is in the direction one would expect if at low ionic strength the polyelectrolyte layer expands slightly due to decreased charge shielding. (32 refs.)

68933 The dynamics of the stress stage of osmotic haemolysis. H.A.Massaldi (CIDCA—Facultad de Ciencias Exactas, La Plata, Argentina), A.Fuchs, C.H.Borzi.
J. Biomech. (GB), vol.16, no.2, p.103-7 (1983).
A simple physical model for the dynamics of the stress stage of osmotic haemolysis is presented. An elastic restitutive coefficient for the red cell membrane is defined to relate the increase of internal pressure to the volume change during the stress stage, and it is estimated on the basis of the work of Evans et al. (1976, 1977). It is shown that the time elapsed between complete swelling and the start of haemoglobin leakage can be a substantial part of the total haemolysis time, in accordance with experimental results reported in the literature. (24 refs.)

68934 NMR studies of perfused cells. D.L.Foxall, J.S.Cohen (Dev. Pharmacology Branch, Nat. Inst. of Child Health & Human Dev., Nat. Inst. of Health, Bethesda, MD, USA).
J. Magn. Resonance (USA), vol.52, no.2, p.346-9 (April 1983).
NMR has been applied as a noninvasive method for the study of the metabolism of cells. To study cell suspensions by NMR they must be densely packed so that spectra with an adequate signal to noise ratio are obtained. This requirement makes NMR studies of cells difficult because they must be supplied with nutrients and oxygen to avoid cell death. Recently, two methods of perfusing cells have been described, both of which require that the cells adhere to a surface during culture, and this limits their applicaiton. The authors present a cell perfusion technique which relies upon embedding cells in an agarose matrix. (9 refs.)

68935 In vivo phosphorus-31 nuclear magnetic resonance reveals lowered ATP during heat shock of Tetrahymena. R.C.Findly, R.J.Gillies, R.G.Shulman (Dept. of Biology, Yale Univ., New Haven, CT, USA).
Science (USA), vol.219, no.4589, p.1223-5 (11 March 1983).
Cells synthesize a characteristic set of proteins—heat shock proteins—in response to a rapid temperature jump or certain other stress treatments. The technique of phosphorus-31 nuclear magnetic resonance spectroscopy was used to examine in vivo the effects of temperature jump on two species of Tetrahymena that initiate the heat shock response at different temperatures. An immediate 50 percent decrease in cellular adenosine triphosphate was observed when either species was jumped to a temperature that strongly induces synthesis of heat shock proteins. This new adenosine triphosphate concentration was maintained at the heat shock temperature. (12 refs.)

87.25D Biological transport; cellular and subcellular transmembrane physics

68936 Minimal model for membrane oscillations in the pancreatic β-cell. T.R.Chay (Dept. of Biological Sci., Univ. of Pittsburgh, Pittsburgh, PA, USA), J.Keizer.
Biophys. J. (USA), vol.42, no.2, p.181-9 (May 1983).
Following the experimental findings of water et al. (in Biochemistry Biophysics of the Pancreatic-β-Cell, George Thieme Verlag, New York, p.100, 1980), the authors have formulated a mathematical model for ionic and electrical events that take place in pancreatic β-cells. Their formulation incorporates a Hodgkin-Huyxley type gating mechanism for Ca^{2+} and K^+ channels, in addition to Ca^{2+} gated K^+-channels. Consistent with the experimental observations, the authors' model generates spikes and bursts in β-cell membrane potentials and gives the correct responses to additions of glucose, quinine, and tetraethylammonium ions. The response of the oscillations to ouabain and changing concentrations of external K^+ can be incorporated into the present model, although a more complete treatment would require inclusion of the Na^+/K^+ pump. (25 refs.)

68937 A note on the reactivation of the fast sodium current in spherical clusters of embryonic chick heart cells. L.Ebihara, N.Shigeto, M.Lieberman, E.A.Johnson (Dept. of Physiology, Duke Univ. Medical Center, Durham, NC, USA).
Biophys. J. (USA), vol.42, no.2, p.191-3 (May 1983).
Reactivation of the fast sodium current in spherical clusters of embryonic chick heart cells was studied using the two-microelectrode voltage-clamp technique. The results show that there are at least two phases of reactivation. The contribution of the two phases to the overall reactivation process is highly dependent on the particular pulse protocol used to measure them. (15 refs.)

68938 Movement of interstitial water through loaded articular cartilage. P.A.Torzilli, D.A.Dethmers, D.E.Rose (Dept. of Biomech., Hospital for Special Surgery, Cornell Univ. Medical Coll., New York, NY, USA), H.F.Schryuer.
J. Biomech. (GB), vol.16, no.3, p.169-79 (1983).
Water transport through articular cartilage and across the articular surface is a major factor controlling the amount and rate of tissue deformation. To study water movement concentration profiles within the tissue were determined using radiotracer techniques. Water movement was spatially and temporally mapped for unloaded, undeformed tissue, after cyclic and dead weight creep, and for recovery following dead weight creep using a uniaxial confined compression configuration to produce one-dimensional fluid movement. In unloaded tissue diffusion rapidly exchanged water by 15 minutes while the gross efflux of fluid during cyclic and dead weight creep compression effectively inhibited any external water influx. During recovery fluid imbibition was restricted when a small surface load was present, and only after complete removal of all surface traction was a large fluid efflux found. The compression and/or collapse of the uppermost surface layer of the tissue is believed responsible for controlling tissue fluid transport and mechanical response. (28 refs.)

68939 Voltage and Ca^{2+}-activated K^+ channel in baso-lateral acinar cell membranes of mammalian salivary glands. Y.Maruyama, D.V.Gallacher, O.H.Petersen (Physiological Lab., Univ. of Liverpool, Liverpool, England).
Nature (GB), vol.302, no.5911, p.827-9 (28 April 1983).
Demonstrates directly, by using the patch-clamp technique, the existence of a K^+ channel with a large conductance localized in the basolateral plasma membranes of mouse and rat salivary gland acinar cells. The K^+ channel has a conductance of ~ 250 pS in the presence of high K^+ solutions on both sides of the membrane. Although mammalian exocrine glands are believed not to possess voltage-activated channels, the probability of opening the salivary gland K^+ channel opening, particularly at higher membrane potentials, was increased markedly by elevating the internal ionized Ca^{2+} concentration, as previously shown for high-conductance K^+ channels from cells of neutral origin. The Ca^{2+} and voltage-activated K^+ channel explains the marked cellular K^+ release that is characteristically observed when salivary glands are stimulated to secrete. (22 refs.)

68940 Movement of myosin-coated fluorescent beads on actin cables in vitro. M.P.Sheetz (Dept. of Physiology, Univ. of Connecticut Health Center, Farmington, CT, USA), J.A.Spudich.
Nature (GB), vol.303, no.5912, p.31-5 (5 May 1983).
Myosin-coated fluorescent beads are observed to move unidirectionally along organized actin filament arrays in the alga, Nitella, with an average velocity similar to in vivo rates of movement in muscle and other cells. The myosin produces the motive force, as the movement is ATP dependent and is blocked by inactivation of the myosin heads. The movement, which occurs in the absence of bipolar thick filaments, provides a quantitative assay for myosin motility. (31 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

68941 Relationship between membrane excitability and single channel open-close kinetics. J.R.Clay, L.J.DeFelice (Nat. Inst. of Neurological, Communicative Disorders & Stroke, Nat. Insts. of Health, Woods Hole, MA, USA).
Biophys. J. (USA), vol.42, no.2, p.151-7 (May 1983).
Describes a novel technique for simulating the influence of the effects of single channel kinetics on the voltage changes associated with membrane exci-

tability. The technique uses probability distribution functions for the durations of channel open- and closed-state lifetimes, which can be calculated for any model of the ion conductance process. To illustrate the technique, the authors have used the Hodgkin and Huxley model of nerve membrane ion conductance to simulate channel kinetics during predetermined voltage changes, such as a voltage jump and an action potential. The authors have also simulated the influence of channels on voltage changes in a free running, non-voltage-clamped patch of membrane 1 μm^2 or less in area. The latter results provide a direct illustration of the relationship between fluctuations of membrane excitability and fluctuations in channel open- and closed-state lifetimes. (36 refs.)

68942 Dielectric breakdown of human skin in vivo. S.Grimnes (Dept. of Biomedical Engng., Rikshospitalet, Oslo, Norway).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.379-81 (May 1983).
The human skin is normally a high-impedance tissue. In an electric shock (e.g. unintended power line shock or intended defibrillator shock) this high impedance is broken down. The isolating part of the skin is the stratum corneum which is often only 10 μm thick, and it is therefore easy to presuppose a dielectric breakdown mechanism. However, the skin admittance is of an electrolytic nature (Rosendal, 1945), and the question is whether it is relevant to consider a dielectric breakdown mechanism at all. This technical note tries to estimate the importance of a dielectric breakdown mechanism in human skin in vivo. It is based upon a method which sufficiently reduces the influence of the electrolytic admittance. Because dielectric breakdown in the experiments described was slow and not pronounced up to 300-500 V, it is not probable that breakdown with power line potentials is of dielectric origin. It is difficult from the results reported to decide the breakdown mechanism during defibrillator shock. A dielectric breakdown mechanism from >2 kΩ to <25 Ω must be considered. (9 refs.)

87.32 PHYSIOLOGICAL OPTICS, VISION

68943 The Berkeley orthokeratology study. III. Safety. K.A.Polse, R.J.Brand, R.J.Keener, J.S.Schwalbe (School of Optometry, Univ. of California, Berkeley, CA, USA), D.W.Vastine.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.321-8 (April 1983).
For pt.II see ibid., vol.60, p.187-98 (1983). The safety of orthokeratological (OK) procedures was assessed by monitoring several ocular characteristics including corneal thickness, refractive astigmatism, corneal astigmatism, correctable spectacle acuity, corneal edema, corneal staining, and endothelial cell density. Safety was also assessed by reviewing the number and causes of extra clinical visits that occurred because of ocular complications and by determining whether safety factors were related to patients lost to follow-up. It appears that OK treatment is safe for the types of patients who participated in this study, but it may require more patient monitoring than would be needed to achieve and maintain a physiologically acceptable fit with conventional hard contact lens prescriptions. (16 refs.)

87.32C Anatomy and optics of the eye

68944 Retinal images and astigmatic distortions in the individual corrected aphakic eye. L.B.Godio (Coll. of Optometry, Univ. of Houston, Houston, TX, USA), M.P.Keating.
Appl. Opt. (USA), vol.22, no.8, p.1221-6 (15 April 1983).
For paraxial objects viewed at finite distances from the correction plane, retinal image size and retinal distortions due to astigmatism are obtained for spectacle- or contact-lens-corrected aphakic individuals with astigmatism. The authors' methods are based not on the analysis of schematic or reduced eyes but on clinical measurements (corneal, refractive, pachometer, and correction parameters) that correspond to the individual patient. (12 refs.)

68945 Optical prophylaxis for environmental myopia: an epidemiological assessment of short-term effects. J.Daubs (TWR Corp., Ft. Lauderdale, FL, USA), A.J.Shotwell.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.316-20 (April 1983).
From a cohort study of 120 young (18 to 20 years of age) male military students with low initial refractive error ($\leq \pm 1$ D, spherical equivalent), estimates were made of the short-term (5 months) effect of two forms of optical treatment to prevent school-related myopia. The cumulative incidence of clinically significant (>0.25 D, spherical equivalent) myopic progression was less [standardized morbidity ratio (SMR)$=0.45$] among those prescribed monofocal convex lenses ($+1.25$ D over far R) and prisms (2 Δ base-in OU) and even more reduced (SMR$=0.32$) among those prescribed bifocals ($+1.5$ D near adds) compared with those receiving sham treatment (no. 1 pink tint). Placebo-treated patients were more than twice [rate ratio (RR)$=2.2$, 1.5] as likely as the monofocal group, and more than three times (RR$=3.2$, 1.7) as likely as the bifocal patients, to suffer myopic progression during the period of follow-up. (8 refs.)

68946 Evolutionary links between apposition and superposition optics in crustacean eyes. D.-E.Nilsson (Dept. of Zoology, Univ. of Lund, Lund, Sweden).
Nature (GB), vol.302, no.5911, p.818-21 (28 April 1983).
Reports that the plantonic larvae of most euphausiids and decapods possess a transparent type of apposition eye, designed for plantonic life, that is pre-adapted for superposition optics. This discovery suggests that the evolution of superposition eyes in crustaceans has its origin in the special apposition optics founding the larval eyes, thus providing the first evidence of an evolutionary link between apposition and superposition optics. 87.32S Psychophysics of vision, visual perception, binocular vision

68948 Rapid calculation procedures for the maximum-likelihood method of adaptive psychophysics. B.R.Shelton (Univ. of Western Ontario, London, Ontario, Canada).
Behav. Res. Methods & Instrum. (USA), vol.15, no.1, p.87-8 (Feb. 1983).
Describes calculation methods for psychophysical experiments in which the response of the subject determines parameters of subsequent trial presentations. Two subroutines are provided. They are fast enough to complete calculations for the maximum likelihood procedure so that it can be used in experiments. (6 refs.)

68949 3D TV. T.Kitani (Wireless Res. Lab., Matsushita Electric Industrial Co. Ltd., Osakai, Japan).
J. Inst. Telev. Eng. Jpn. (Japan), vol.36, no.12, p.1051-9 (Dec. 1982). In Japanese.
The basic principles of stereo vision are described from the point of view of perception with conditions which permit binocular vision differences. A stereo imaging and TV system is shown and basic parameters are derived. The handling of the display of two image sets is illustrated with the example of a separately polarised images system. The use of PLZT glasses, a stereo video game (Zega Enterprises), computer graphics (Matsushita US), Sony stereo TV and multiprojection, autostereoscopy, the software for 3D TV as used by Tokyo Univ. and GENISCO are described. (23 refs.)

68950 Binoculear stereopsis in an insect. S.Rossel (Dept. of Zoology, Univ. of Zurich, Zurich, Switzerland).
Nature (GB), vol.302, no.5911, p.821-2 (28 April 1983).
Binocularity in insects is generally assumed to have the same function as in many vertebrates-the perception of depth. Evidence for this hypothesis stems from the observation that one-eyed dragonfly larvae, tiger beetle, praying mantids and water scorpions rarely catch prey, but no definitive evidence is available. Depth perception and catching behaviour depend on visual attention and visual behaviour and it is difficult to assess what is impaired when one eye is occluded. A more promising approach to studying the importance of binocular disparity is one that does not interfere with normal binocular vision, and allows potential monocular depth cues to be controlled carefully. These criteria were met in the present study by the use of prismatic lenses placed in front of the compound eyes of the praying mantis, thus creating a conflict between binocular disparity and mononuclear cues. The results demonstrate that mantids do indeed rely on binocular triangulation when estimating the distance of prey, and thus provide the first unequivocal evidence for stereoscopic vision in an invertebrate. 68951 Infant intermodal speech perception is a left-hemisphere function. K.MacKain (Dept. of Psychiatry, Cornell Univ. Medical Coll., New York, NY, USA), M.Studdert-Kennedy, S.Spieker, D.Stern.
Science (USA), vol.219, no.4590, p.1347-9 (18 March 1983).
Prelinguistic infants recognized structural correspondences in acoustic and optic properties of synchronized, naturally spoken disyllables, but did so only when they were looking to their right sides. This result suggests that intermodal speech perception is facilitated by rightward orientation of attention and subserved by the left hemisphere. (9 refs.)

68952 An introduction to the application of system identification techniques to elements of the neuromuscular system. J.R.Rosenberg, D.J.Murray-Smith, A.Rigas (Univ. of Glasgow, Glasgow, Scotland).
Trans. Inst. Meas. & Control (GB), vol.4, no.4, p.187-201 (Oct.-Dec. 1982). [received: April 1983]
A simplified account of the organisation of the neuromuscular system is presented. An important component of this system, the 'muscle spindle', is a complex sensor that responds to imposed length changes and is thought to provide information which is important in the control of movement and in the maintenance of posture. The structure of the muscle spindle and its response to various inputs are described. The multi-input and multi-output nature and nonlinear behaviour of the muscle spindle are emphasised, both in terms of continuous and pulse-coded quantities. The methods of preprocessing of pulse-coded signals from nerves, and the identification techniques currently applied by neurophysiologists for the estimation of the parameters of linearised models of the muscle spindle, are presented and assessed. New developments in the identification on point-process systems are shown to be applicable to some aspects of muscle-spindle behaviour. This approach, based upon point-process parameters, is applied to an analysis of the output signal of a muscle spindle under a variety of input conditions and to the estimation of a transfer function of the muscle spindle subjected to a point-process input. A description of one nonlinearity and the effects of an additional input are also presented. (65 refs.)

68953 An adaptive control model for human head and eye movements while walking. J.D.McDonald, A.T.Bahill, M.B.Friedman (Carnegie-Mellon Univ., Pittsburgh, PA, USA).
IEEE Trans. Syst., Man & Cybern. (USA), vol.SMC-13, no.2, p.167-74 (March-April 1983).
When a person walks the head undergoes horizontal and vertical rotations, and also horizontal and vertical translations. To visually fixate on an object while walking, compensatory horizontal and vertical eye movements must be made. The model for this gaze (head plus eye) control system includes three types of eye movements: smooth pursuit, saccadic, and vestibulo-ocular. The smooth pursuit system uses a target-selective adaptive controller that compensates for the large inherent time delay and produces zero-latency tracking of predictable targets. Target movements were selected to minimize the role of the saccadic control system. Typical tracking is shown while seated with the head restrained, standing with unrestrained head, performing voluntary head rotations, and walking. Each additional degree of freedom produced additional head movements that were compensated by additional eye movements. It is shown that while a human walks the effects of head rotations (yaw) cancel the effects of head translations, thus minimizing the resulting horizontal eye rotations necessary to maintain fixation. (33 refs.)

68954 Quasisteady arterial blood flow. P.Gordon (Dept. of Math. Sci., Purdue Univ., Hammond, IN, USA).
J. Math. Phys. (USA), vol.24, no.4, p.1001-10 (April 1983).
Fluid flow through a bifurcating system of elastic tubes is modeled with the inviscid compressible time-dependent equations of fluid flow. Because of the physical scale of the problem (the length of the tube is large relative to its diameter), quasisteady analysis can be applied to the system of hyperbolic first order partial differential equations. Several simplified models are thereby obtained. Although similar in some respects to the usual incompressible models, the quasisteady models are seen to be significantly different. For example, the sound speed of the fluid remains an important parameter in the boundary condition. Numerical solutions are obtained for various problems. Results are presented for the one-layer problem, which was studied in some depth, and a three-layer problem, in which the layers are connected by bifurcation boundary conditions. The solutions are shown to be physically reasonable. Of special interest is the clear display of the mechanism in the model by which the elastic wall converts the pulsatile flow to a much more continuous outflow. (22 refs.)

68955 Gas mixing within the acinus of the lung. L.A.Engel (Thoracic Medicine Unit, Westmead Hospital, Sydney, Australia).
J. Appl. Physiol. (USA), vol.54, no.3, p.609-18 (March 1983).
The subject is reviewed with an emphasis on recent developments in model analyses. Application of computer technology has facilitated the study of simultaneous convection and diffusion within a complex geometry approximating the airways and air spaces of the lung. During an inspiration of fresh gas the diffusion front separating inspired from 'alveolar' gas is stationed within a portion of the acinus where the magnitudes of gas transport by convection and diffusion are similar. This constitutes the peripheral boundary of the Fowler dead space. Asymmetry of intra-acinar branching results in an inequality of gas concentrations within alveolar gas, despite homogeneous volume expansion. This is due to an interaction between diffusion and convection at branch points subtending units of unequal lengths. During a respiratory cycle a 'diffusive Pendelluft' between these units results in a 'first in-first out' pattern and a sloping alveolar plateau on the expired tracing, despite synchronous and homogeneous volume changes. Experimental results suggest that incomplete alveolar gas mixing constitutes a measurable limitation to gas exchange in the normal lung. (56 refs.)

68956 Effect of height on alveolar liquid pressure in isolated edematous dog lung. K.C.Beck, J.Lai-Fook (Div. of Thoracic Diseases & Internal Medicine, Mayo Clinic, Rochester, MN, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.619-22 (March 1983).
Micropipettes were used in conjunction with a servo-nulling system to measure alveolar liquid pressure (Pliq) in 'free' liquid spaces 0.1-1.0 mm beneath the pleural surfaces of excised dog lung lobes. Lobes were mounted with the long axis vertical, held at constant transpulmonary pressure (Ptp), perfused with plasma, and made edematous by raising vascular pressure. Pliq was measured at two sites, near the top (apical) and bottom (basal) surfaces, about 8-10 cm apart in height, and wet (W) to dry (D) weights for the top and bottom sections were obtained in two groups of five lobes, one at Ptp of 5 cmH_2O and the other at Ptp of 15 cmH_2O. At Ptp of 5 cmH_2O, there was no significant difference (mean±SD) between apical (2.4±0.5 cmH_2O) or basal Pliq values (2.2±0.9 cmH_2O) relative to pleural pressure. At Ptp of 15 cmH_2O, basal Pliq values (3.9±1.4) were always more positive than apical Pliq values (2.0±1.6), an indication of more liquid at the lung base. (24 refs.)

68957 Adaptation of vascular pressure-flow-volume hysteresis in isolated rabbit lungs. K.C.Beck, J.Hildebrandt (Dept. of Physiology & Biophys., Univ. of Washington, Seattle, WA, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.671-9 (March 1983).
Hysteresis within two pairs of variables describing the state of the lung vascular system [pulmonary arterial pressure (Ppa) and flow ($\dot{Q}$) and Ppa and change in vascular volume (ΔVvasc)] was investigated in isolated plasma-perfused rabbit lungs. $\dot{Q}$ was increased and decreased stepwise, in series of five cycles each, while pulmonary venous pressure (Ppv) and lung volume were held constant. Changes in Vvasc were estimated from changes in fluid volume of the venous reservoir. The relationships within pairs of variables over each complete cycle were described by loops whose areas and widths were used to quantify the hysteresis. In successive cycles, these parameters decreased toward constant values (limit cycles), most of the change occurring by the second cycle. Areas of Ppa-$\Delta\dot{V}$vasc loops correlated closely with areas of Ppa-$\dot{Q}$ loops over all five cycles of a series. For Ppa-$\dot{Q}$ loops, the ratio of average pressure-width to total pressure excursion decreased from 0.15 initially to around 0.05 in the fifth cycle. It was concluded that the relationships between Ppa and $\dot{Q}$ and Ppa and ΔVvasc are markedly sensitive to vascular pressure or flow history. (35 refs.)

68958 Partitioning of respiratory mechanics in ansthetized cats. W.A.Zin, L.D.Pengelly, J.Milic-Emili (Meakins-Christie Labs., McGill Univ., Montreal, Quebec, Canada).
J. Appl. Physiol. (USA), vol.54, no.3, p.708-13 (March 1983).
In five spontaneously breathing anesthetized cats (pentobarbital sodium 35 mg/kg), airflow, changes in lung volume, and tracheal, transpulmonary, esophageal, and gastric pressures were measured. The airways were occluded at end inspiration (V_T). During the ensuing period of apnea (Breuer-Hering inflation reflex), the animal relaxed the respiratory muscles, and passive elastance of the respiratory system, lung, and chest wall were computed by dividing tracheal, transpulmonary, and esophageal pressures, respectively, by V_T. With the animal still relaxed, the airways were reopened, and during the ensuing relaxed expiration, pressure-flow relationships were determined for the respiratory system, lung, and chest wall. A linear relationship was found for the former, whereas power functions best described the others. While the pulmonary pressure-flow relationship exhibited an upward concavity, that for the chest wall presented an upward convexity. Chest wall resistance increased with decreasing lung volume; this may reflect asynchronous emptying of rib cage and abdomen-diaphragm and volume dependence of chest wall resistance. (20 refs.)

68959 Determination of forces in extensor pollicis longus and flexor pollicis longus of the thumb. K.N.An, W.P.Cooney, E.Y.Chao, L.J.Askew, J.R.Daube (Orthopedic Biomech. & Electromyography Labs., Mayo Clinic, Rochester, MN, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.714-19 (March 1983).
A mathematical model was developed to calculate internal forces in the thumb. The solution was indeterminate, since the number of unknown forces exceeded the equations available in the static force analysis. To resolve the problem, the muscle forces were obtained in conjunction with quantitative electromyographic data. The relationship between muscle force and integrated electromyograms (IEMG) were obtained in terms of polynomial function. A multiple-polynomial regression analysis of the measured force and IEMG data was used to determine the correlation coefficients. Then the muscle forces were calculated with the thumb performing tip, key, and pulp pinches and grasp. The muscle forces were found to be in the range of 3-120 N for the flexor pollicis longus and 4-40 N for the extensor pollicis longus. (20 refs.)

68960 Lobar flow patterns in a hollow cast of canine central airways. B.Snyder, M.J.Jaeger (Dept. of Physiology, Coll. of Medicine, Univ. of Florida, Gainesville, FL, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.749-56 (March 1983).
To demonstrate that the regional partitioning of flow in central airways is direction dependent, the authors compared inspiratory and expiratory lobar flows in a hollow rigid cast of canine lungs. Lobar flows were measured by a hot-wire anemometer, simultaneous tracheal flows by a pneumotachograph, and data displayed as (lobar) flow-(tracheal) flow curves. For tracheal airflows between 50 and 370 ml/s, the authors found that inspiratory apical flows were smaller, and basal flows larger, than corresponding expiratory distributions. This effect was largely extinguished by substituting a gas mixture of 85% He-15% N_2; resulting regional flows were comparable to expiratory distributions obtained on room air. Thus canine central airways structure induces a kinematically irreversible flow pattern, consistent with a model of 'cascade flow' in which branching structure modifies the distribution only of inspiratory flow. These results support Fowler's (1949) concept that lung regions fill and empty sequentially and may be pertinent to analyses of regional washout. (24 refs.)

68961 Total airway resistance and respiratory muscle activity during sleep. J.M.Lopes, E.Tabachnik, N.L.Muller, H.Levison, A.C.Bryan (Respiratory Physiology, Res. Inst., Hospital for Sick Children, Toronto, Ontario, Canada).
J. Appl. Physiol. (USA), vol.54, no.3, p.773-7 (March 1983).
Total airway resistance (Raw) and inspiratory muscle activity was measured in five normal adults during sleep. Flow was derived by electronically differentiating a volume signal obtained with a respiratory inductive plethysmograph. Esophageal and abdominal pressures were measured with a standard balloon technique, and electromyograms (EMG) of the intercostal muscles and diaphragm were recorded with surface electrodes. Changes in Raw were sleep state dependent. Raw increased by a mean of 230% during non-rapid-eye-movement sleep (NREM) compared with wakefulness. During rapid-eye-movement (REM) sleep mean values were comparable to the ones measured during wakefulness. Intercostal EMG activity increased by 34% from wakefulness to NREM sleep. At the same time, transdiaphragmatic pressure (Pdi) increased by a mean of 20% despite no change in diaphragmatic EMG activity, indicating an increase in muscle efficiency. From NREM to REM sleep diaphragmatic EMG increased by 30%, but despite the increase in diaphragmatic activity, mean Pdi values were 10% lower during this sleep state, indicating a decrease in muscle efficiency. It is concluded that changes in total airway resistance, probably related to a decrease in upper airway muscle tone, lead to an increase in the work of breathing during sleep. (20 refs.)

68962 Mechanical properties of alveolar wall after pneumonectomy and ozone exposure. C.J.Martin, E.S.Boatman, G.Ward (Virginia Mason Res. Center, Seattle, WA, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.785-8 (March 1983).
The mechanical properties of the alveolar wall were studied in rabbits intermittently exposed to 0.4 ppm ozone (O_3) for 210 h. Compared with age-matched controls, those exposed had greater extensibility of the tissue before deformation (yield) and break, greater energy loss with length-tension cycling (hysteresis), and a lower stress at an extension of 1.5 times resting length. O_3 exposure appeared to increase the freedom of connective tissue fibers. After a pneumonectomy, a similar O_3 exposure did not alter these properties in comparison with unexposed rabbits with pneumonectomy. Lung growth protected the animal against the O_3-induced change in tissue properties. Mechanical properties of alveolar walls removed from the lung remaining after pneumonectomy were similar to those from unoperated controls. Despite the marked growth of connective tissue fibers these tissues were similar in maximum extensibility, viscoelastic properties, and the stress developed in extension. (23 refs.)

68963 Alveolar size as a determinant of pulmonary distensibility in mammalian lungs. P.S.Haber, H.J.H.Colebatch, C.K.Y.Ng, I.A.Greaves (Dept. of Thoracic Medicine, Univ. of New South Wales, Little Bay, New South Wales, Australia).
J. Appl. Physiol. (USA), vol.54, no.3, p.837-45 (March 1983).
Pulmonary distensibility depends on surface tension and tissue elastic forces, but the relative contribution of each to total lung recoil remains incompletely defined. By applying an exponential analysis to static pressure-volume curves obtained from the excised lungs of cats, dogs, and rats with air and saline filling, the exponential constant K (an index of lung distensibility) was related to the mean linear intercept L_m (a morphometric estimate of the mean size of peripheral air spaces at maximal inflation). K for air filling (K_a) was unrelated to K for saline filling (K_s), and K_s was unrelated to L_m, but similar highly significant regressions of K_a on L_m were found in each species, and the common regression was similar to that described previously for human lungs. Approximately 86% of the variance in lung distensibility (K_a) within and between species was explained by L_m. Because L_m determines the size of air spaces, and therefore the alveolar surface-to-volume ratio, the findings indicate that the density of surface forces is the major determinant of lung distensibility in the air-filled state. (37 refs.)

68964 A model for the calculation of mechanical power during distance running. K.R.Williams (Dept. of Phys. Education, Univ. of California, Davis, CA, USA), P.R.Cavanagh.
J. Biomech. (GB), vol.16, no.2, p.115-28 (1983).
Because widely varying estimates of mechanical power have been calculated for a given speed of running by previous investigators, the effects of various assumptions necessary for mechanical power calculations were evaluated via a segmental energy analysis using 3-D cine data from 31 well-trained subjects running overground at 3.57 $m\ s^{-1}$. The magnitude of power calculated was very dependent upon assumptions involving the amount of between segment energy transfer occurring, the relative metabolic cost of positive vs. negative work, the amount of the total negative work attributed to muscular work, the effects of elastic storage of energy and on the choice of cutoff frequency in filtering the coordinate data. Mechanical power values ranged from 273 to 1775 W depending on the particular assumptions made and computational methods employed giving efficiency ratios from 0.31 to 1.97. These results point to a need for more definitive research into the role played by energy transfer, negative work, and elastic storage of energy before confidence in measured mechanical power can be established. (28 refs.)

68965 Geometric properties of equine metacarpi. G.Piotrowski (Dept. of Mech. Engng., Univ. of Florida, Gainesville, FL, USA), M.Sullivan, P.T.Colahan.
J. Biomech. (GB), vol.16, no.2, p.129-39 (1983).
Paired equine metacarpals were harvested, cleaned and sectioned transversely every 20 mm, and the bone geometry analyzed with a computer program. The cross-sectional area is largest in the middle third of the bone, and tapers off at either end. The principal axes are typically within 15° of the anatomical axis, with the distal end rotated internally relative to the proximal end. At midshafts the bending stiffness in the antero-posterior plane is about 2/3 of the stiffness in the medio-lateral plane. The torsional stiffness is highest proximally. The equine third metacarpal appears to be designed to resist axial compression and mediolateral bending very well, and exhibits uniform resistance to torsion along its length. (16 refs.)

68966 Three-dimensional visualisation of velocity profiles in the ascending aorta in dogs, measured with a hot-film anemometer. K.P.Paulsen, J.M.Hasenkam (Dept. of Thoracic & Cardiovascular Surgery, Aarhus Univ. Hospital, Aarhus, Denmark).
J. Biomech. (GB), vol.16, no.3, p.201-10 (1983).
Three-dimensional blood velocity profiles were registered in the ascending aorta of dogs approximately 2 and 5 cm above the aortic valves by means of constant temperature hot-film anemometry. The velocity was measured at 41 predetermined points of measurement evenly distributed over the cross-sectional area. Later data analyses using a three-dimensional plotting system, visualised velocity profiles at 200 time intervals during one mean heart cycle. The overall appearance of the profiles was that of a flat transitional flow with a slight skewness. The highest velocity was found nearer to the posterior and left vessel wall. The skewness started during top systole and persisted to the beginning of diastole. Furthermore, many small velocity fluctuations were seen during top systole, but they might also be caused by secondary rotational flow phenomena. This new three-dimensional and dynamic method for visualising velocity profiles seems to offer advantages, as it demonstrates the total velocity profile all over the cross-sectional area. (16 refs.)

68967 Radial bulging of the annulus fibrosus during compression of the intervertebral disc. J.A.Klein, D.S.Hickey, D.W.L.Hukins (Dept. of Medical Biophys., Univ. of Manchester, Manchester, England).
J. Biomech. (GB), vol.16, no.3, p.211-17 (1983).
An analysis of the bulging of the annulus fibrosus as a function of the height of the intervertebral disc during compression is presented. The theory was compared with the results of experimental tests on rabbit lumbar discs. When viewed in profile the ventral bulge closely resembled an arc of a circle; at each stage of compression it appeared to extend from the cranial to the caudal extremities of the annulus fibrosus. The radius of curvature of the arc was measured as a function of disc height and the results compared with theoretical predictions. Good agreement was obtained if it was assumed that about half the volume change swept out by the approach of the cranial and caudal end-plates was accommodated by the annular bulge. The lengths of the collagenous fibres reinforcing the outer lamella of the ventral annulus were estimated from the dimensions of the ventral bulge; no appreciable length increase appeared to accompany compression. (25 refs.)

68968 Normative data of knee joint motion and ground reaction forces in adult level walking. E.Y.Chao, R.K.Laughman, E.Schneider, R.N.Stauffer (Dept. of Orthopedics, Mayo Clinic, Rochester, MN, USA).
J. Biomech. (GB), vol.16, no.3, p.219-33 (1983).
A normative data base of temporal distance factors, knee joint motion and ground reaction force patterns for 148 adults during level walking is reported. The data were studied using parametric and non parametric (Fourier series) representations to facilitate statistical analyses. Key parameters were divided according to age and sex. Individual force and motion curves of each normal subject were averaged to establish the 'typical' patterns. All typical patterns were combined to construct the 'general' patterns. The essential number and most significant Fourier coefficients were determined. It was found that the sex-related variation is more significant than the age-related variation in adult gait. This data base can serve as a common reference for comparison. (55 refs.)

68969 Mathematical model of the human ankle joint. G.T.Wynarsky, A.S.Greenwald (Cleveland Res. Inst., St. Vincent Charity Hospital, Cleveland, OH, USA).
J. Biomech. (GB), vol.16, no.4, p.241-51 (1983).
It has been suspected that the mechanical environment in which a particular joint functions has an effect on the initiation or progression of degenerative joint disease. The objective of this study is to define the mechanical environment of the ankle joint, specifically, the contact areas and pressure distributions, through the development and analysis of a simplified mathematical model. Since the state of pressure across articular surfaces during function is influenced by joint incongruity, cartilage thickness profile and the geometry of the opposing surfaces, these factors have been incorporated into the model formulation. Mathematical analysis of the model has resulted in pressure distributions in both the anterior-posterior and medial-lateral directions and contact area growth plots which correlate well with observed ankle contact patterns obtained from in vitro investigations. The significance of joint incongruity to these pressure distributions and to the relative immunity of the ankle joint to primary osteoarthritis is discussed. (15 refs.)

68970 Two-dimensional dynamic modelling of human knee joint. M.H.Moeinzadeh (Dept. of General Engng., Univ. of Illinois, Urbana, IL, USA), A.E.Engin, N.Akkas.
J. Biomech. (GB), vol.16, no.4, p.253-64 (1983).
A mathematical dynamic model of the two-dimensional representation of the knee joint is presented. The profiles of the joint surfaces are determined from X-ray films and they are represented by polynomials. The joint ligaments are modelled as nonlinear elastic springs of realistic stiffness properties. Nonlinear equations of motion coupled with nonlinear constraint conditions are solved numerically. Time derivatives are approximated by Newmark difference formulae and the resulting nonlinear algebraic equations are solved employing the Newton-Raphson iteration scheme. Several dynamic loads are applied to the centre of mass of the tibia and the ensuing motion is investigated. Numerical results on ligament forces, contact point locations between femur and tibia, and the orientation of tibia relative to femur are presented. The results are shown to be consistent with the anatomy of the knee joint. (26 refs.)

68971 The forces and couples in the human trunk during level walking. A.Cappozzo (Lab. of Biomech., Univ. degli Studi, Roma, Italy).
J. Biomech. (GB), vol.16, no.4, p.265-77 (1983).
The intersegmental force and couple exchanged between upper and lower body across a transverse section passing through the fourth lumbar vertebra were estimated during level walking on a straight line at speeds ranging from 0.99 to 2.23 ms^{-1}. This was done using 3-D kinematic information relative to the head, upper limbs, and upper torso, obtained through a stereophotogrammetric technique, and the relevant inertial parameters obtained using anthropometric measurements and estimation techniques provided in the literature. Twenty walking cycles of five normal adult male subjects were analysed. The intersegmental force and couple components are presented as referenced to both a laboratory and pelvic set of axes. Using these results some considerations are made concerning the variations which the overall trunk muscles effort undergoes because of mean walking speed changes. The muscular action on the trunk is inferred from the intersegmental couple components. The various factors that contribute to the build-up of the intersegmental force and couple are analysed and their relative importance assessed. (30 refs.)

68972 The effect of blood flow phenomena on oxygenation efficiency. Tze-Wen Chung, Chau-Jen Lee (Dept. of Chem. Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan).
J. Chin. Inst. Eng. (Taiwan), vol.6, no.1, p.51-5 (Jan. 1983).
The effect of blood flow on the oxygenation efficiency was studied by using a single-tube silicone rubber membrane oxygenator. The ranges of flow covered the regions, of laminar, turbulent, and secondary flow. The existence of hemoglobin in the blood actually enhances the rate and capacity of oxygen carried by the blood. Mass transfer equations which involved turbulent eddy diffusivity were numerically solved for radial as well as axial profiles in terms of the degree of oxygen saturation. Further investigation on the effect of turbulent and secondary flow is still being undertaken. (6 refs.)

68973 Comparison of computer models of the human arterial system for the assessment of clinical data. P.R.Bourne (Dept. of Bioengng., St. Thomas's Hospital, London, England), R.I.Kitney.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.319-23 (May 1983).
Arterial pressure and flow measurements can be analysed using a mathematical model of the circulation. A comparison of four models of the circulation used in this way is presented. The results indicate some criteria for evaluating circulation model performance in general. (13 refs.)

68974 Dynamic simulation of the renal medulla. G.L.Barrett, J.S.Packer (Dept. of Electrical Engng., Univ. of Melbourne, Parkville, Victoria, Australia).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.324-32 (May 1983).
The operation of the urinary concentrating system is intimately linked to the complex and distinctive anatomy of the renal medulla, and research into the concentrating mechanism has stimulated considerable endeavour in modelling of the process. The paper presents a dynamic model of the renal medulla which attempts to describe concentrations and axial flows in two sets of tubes, one comprising the loop of Henle and collecting duct and the other comprising the descending and ascending vasa recta, and in the interstitial space. Particular attention is given to modelling of the characteristics of the inner medulla. The model allows for the tapering of the inner medulla towards the papilla, the union of collecting ducts and the fact that nephrons and vascular loops turn back at various depths so that only a small portion of them reach the papilla. The inclusion of this detail in the model leads to a good representation of the concentrating mechanism and the model provides a good basis for the study of phenomena such as sodium reabsorption. (21 refs.)

68975 Online identification of mechanical parameters of the lung. D.A.Linkens, S.J.Rimmer (Dept. of Control Engng., Univ. of Sheffield, Sheffield, England).
Trans. Inst. Meas. & Control (GB), vol.4, no.4, p.177-85 (Oct.-Dec. 1982). [received: April 1983]
Discusses the use of a microcomputer for online estimation of mechanical parameters of the lungs. The identification is based on measurements of airflow at the mouth using a pneumotachograph and oesophageal pressure obtained via a balloon catheter. A simple mathematical model for lung mechanics is used which includes terms for airways resistance, dynamic pulmonary compliance and a nonlinear turbulence factor. The method of identification is a steepest-descent gradient algorithm based on equation-error formulation of the problem. Recently, the estimation algorithm has been transferred to a Research Machines 380Z microcomputer and applied to neo-natal data for rapid assessment of apnoea. Two versions of programs have been implemented, one of which gives an online printer listing of lung parameters based on either inspiratory or expiratory data. The other version uses four DAC channels to give analogue chart recording data. Examples are shown of simultaneous six-channel recordings comprising the primary pressure and flow signals, estimated airways resistance and pulmonary compliance, tidal volume and minute volume. The effect of apnoea on these parameters, together with heart rate, can be assessed using this online identification method. (7 refs.)

68976 System identification of the blood pressure control system by low frequency neural stimulation. R.I.Kitney, C.M.Gerveshi (Dept. of Electrical Engng., Imperial Coll., London, England).
Trans. Inst. Meas. & Control (GB), vol.4, no.4, p.203-12 (Oct.-Dec. 1982). [received: April 1983]
Describes the identification of the control structure of that section of the blood pressure control system which relates cardiac depressor activity to heart rate, arterial blood pressure and respiration. Using pulse frequency modulated PRBS techniques, the parameters of the closed loop frequency and impulse responses of the baroreceptor (pressure transducer) control loop were estimated, thereby gaining a more detailed understanding of the dynamics of the baroreceptor system. (14 refs.)

68977 Second-grade fluid film lubrication in Hertzian contacts with reference to synovial joints. K.M.Nigam, N.M.Bujurke, M.P.Singh, K.Manohar (Centre for Atmospheric & Fluids Sci., Indian Inst. of Technol., New Delhi, India).
Wear (Switzerland), vol.84, no.3, p.261-74 (1 Feb. 1983).
An analysis of squeeze film lubrication between two approaching surfaces is presented with reference to normally loaded human joints. A second-grade fluid represents the synovial fluid in the region between the approaching surfaces. Analytical expressions for the pressure distribution, load-carrying capacity and time of approach between any two film thicknesses are derived. The normalized pressure as well as the average pressure increase with an increase in the non-newtonian dimensionless parameter N_n. With normal young synovial fluid the pressure developed in the joint cavity is considerably greater than with normal old and osteoarthritic synovial fluid. Pressure variation is least around the centre and exit of the surfaces and largest in the intermediate region. The rate of variation in the intermediate region is large for larger values of the minimum film thickness h_0. The rate of variation in the load-supporting capacity is smaller for larger values of h_0 in contrast with the intermediate range of values of h_0 for which it is larger. The times of approach for osteoarthritic and old normal synovial fluid are smaller than the time of approach for healthy normal young synovial fluid and this partly accounts for increased cartilage wear in old osteoarthritic patients. (13 refs.)

68978 The prediction of pathologic fracture in patients with metastatic cancer. E.Buturla, C.Hawkins, D.Seligson, Pope. M.H. (Dept. of Orthopaedics & Rehabilitation, Univ. of Vermont, Burlington, VT, USA).
16th Annual Simulation Symposium. Record of Proceedings, Tampa, FL, USA, 16-18 March 1983 (New York, USA: IEEE 1983), p.33-9
Application of finite element modeling has provided greater understanding of load transmission and shear properties throughout the femur. Oonishi and Hasegawa (1982) used a two-dimensional finite element analysis to investigate different stress properties of cortical and cancellous bone regions of the femur, intuitively, because of the femur is asymmetrical and curved in each planar axis one would expect a three-dimensional model to be more generalizable to a real-world situation. Crowninshield (1980) developed a useful 3-D model to resolve geometrical problems incurred with total hip reconstruction. With this model, as any finite element analysis, a greater number of nodal points and elements yields a more accurate resolution of load stress/displacements. The present study utilized these and other factors in simulating a femur presenting metastatic lesions of the sub- and intertrochanteric regions. Removal of elements in these areas along with their inherent stiffness support properties to the model thus simulated the effect of nonsupportive tumor within otherwise healthy bone. (23 refs.)

87.50 BIOLOGICAL EFFECTS OF RADIATIONS
(inc. effects of fields)

68979 Changes in cell shape and actin distribution induced by constant electric fields. P.W.Luther, H.B.Peng (Dept. of Anatomy, Univ. of Illinois Coll. of Medicine, Chicago, IL, USA), J.Jung-Ching Lin.
Nature (GB), vol.303, no.5912, p.61-4 (5 May 1983).
Describes a galvanotropic response of cultured Xenopus epithelial cells. At a field strength of $5\ \mathrm{V\ cm^{-1}}$ these cells elongate perpendicularly with respect to the field. The anodal side of the cell retracts and both the ends and cathodal edge become active in the extension of ruffling lamellipodia. In parallel with the change in the cell axis, stress fibres are oriented perpendicularly to the field, and a band of actin is associated with the lamellae at the cathodal edge and at the ends of the cell. (28 refs.)

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

68980 Standards for use of visible and nonvisible radiation on the eye. D.H.Sliney (US Army Environmental Hygiene Agency, Aberdeen Proving Ground, MD, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.278-86 (April 1983).
Presently recommended exposure limits for optical radiation permit one to estimate the hazard to the eye and skin for continuous periods of exposure. They apply explicitly only to uninterrupted exposure—the so-called 'worst-case' condition. This paper examines the biological and practical aspects of human exposure to bright light which permit the application of 'use factors' where justified in the use of these exposure limits and considers the limitations of such limits. (17 refs.)

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

68981 Growth kinetics of Bp8 mouse ascites sarcoma after single doses of whole body irradiation. II. Analysis of the progression of cells through the cell cycle. S.Cao, S.Skog, B.Tribukait (Dept. of Medical Radiation Biology, Karolinska Inst., Stockholm, Sweden).
Acta Radiol. Oncol. Radiat. Therapy Phys. & Biol. (Sweden), vol.21, no.5, p.331-43 (1982).
For pt.I see ibid., vol.21, p.255, p.1982. A detailed analysis of the cell kinetics of X-irradiated ascites tumour is presented based on the data of pt.I. The durations of the mitotic delay, the G_1-depletion and the early G_2 blockage were linearly related to the dose. After release of the mitotic division delay the accumulation rate of cells in M and G_1 decreased linearly with the dose: for G_2, plateau values for the accumulation rate were found after 2.5 Gy. The outflow rates from G_2 and M after release of the G_2 blockage showed a shoulder type of dose-response with a D_0 of 2.5 Gy and a n value of 1.5. In addition to an increase in the duration of G_2, generally responsible for the increase in the total cell cycle time at about 24 hours after irradiation and an increase in the duration of the S-phase up to 12 hours after irradiation, an early increase in the duration of G_1 and M was observed. (29 refs.)

68982 Senescence behaviour gamma-irradiated detached Betel (Piper Betle L.) leaf. S.D.Mishra, B.K.Gaur (Biology & Agriculture Div., Bhabha Atomic Res. Centre, Bombay, India).
Curr. Sci. (India), vol.52, no.3, p.135-6 (5 Feb. 1983).
Deferral of senescence in betel leaf by mechanical manipulations like depetiolation was earlier reported. Such an effect of depetiolation-induced delay in senescence was later confirmed. Also, ionising radiations, as a physical means, are known to affect the shelf-life of many perishable commodities. The authors examine the role of gamma radiation in regulating the senescence in detached betel leaf. (13 refs.)

68983 Further experiments to study whether localised fission fragment irradiation of rat lung causes tumours. A.L.Batchelor, T.J.Jenner, L.M.Cobb (MRC Radiobiology Unit, Harwell, Didcot, England).
Phys. Med. & Biol. (GB), vol.28, no.5, p.475-83 (May 1983).
Male albino rats inhaled in aerosol of $^{235}UO_2$ (mass median aerodynamic diameter=2.8 μm and geometric standard deviation=1.6). Approximately 20 h or 7 d post-inhalation the rates were exposed briefly to 10^{12} slow neutrons cm^{-2} in a nuclear reactor, causing the retained $^{235}UO_2$ particles of approximation mass 40 or 400 μm to emit fission fragments were either 80 or 800 cGy approximately and in addition the lungs were exposed gave mean doses of about half that from the fission fragments. The animals were kept for their life-time and killed when they became moribund. Malignant tumours were found in the lungs (squamous cell carcinoma and adenocarcinoma) which were probably induced by the α-rays rather than the fission fragments. Because of insufficient numbers of animals in the experimental groups, however, some statistical uncertainty exists as to whether the fission fragments were in fact less effective than the α-rays per unit absorbed dose in causing malignant tumours of the lung. (8 refs.)

68984 Estimation of a single property of low LET radiations which correlates with biological effectiveness. D.T.Goodhead (MRC Radiobiology Unit, Harwell, Didcot, England), D.J.Brenner.
Phys. Med. & Biol. (GB), vol.28, no.5, p.485-92 (May 1983).
The biological effectiveness of ionizing radiation is believed to be related to the initial structure of the radiation tracks. In this paper, an attempt is made to identify a single physical property of the radiation field that correlates with relative biological effectiveness. This property has been sought in terms of a minimum amount of energy deposition in a certain volume. In order to quantify this approach detailed Monte Carlo track structure simulations have been made of X-rays of widely differing energies and the results have been compared with previously reported experiments of cell killing by these radiations. In terms of the above threshold energy concept, the authors have thus identified a putative critical property of radiations of low ionisation density such as X-rays, namely the rare occurrence of energy deposition of $\geq$100 eV in a volume of about 3 nm diameter. (29 refs.)

68985 The effect of radiation on bioluminescent bacteria: possible use of luminescent bacteria as a biological dosemeter. J.Mantel, M.Freidin (Dept. of Radiology, Sinai Hospital of Detroit, Detroit, MI, USA), A.A.Bulich, H.Perry.
Phys. Med. & Biol. (GB), vol.28, no.5, p.599-602 (May 1983).
Reports investigations on the response of the bioluminescent bacteria, Photobacterium phosphoreum, to radiation and the use of the bacteria as a biological radiation dosemeter. By the latter the authors mean a water-equivalent biological system that will compare beams not merely on the basis of absorbed dose, but also have intrinsic RBE values for different radiation beams. The authors studied the effect of low LET beams of different quality on the bioluminescent survival fraction and compare the RBE values obtained with those previously published. The results show that the smallest detectable dose at present is about 1 Sv. However, there are reasons to expect an improvement in sensitivity of the system by a factor of about two in the future. It is believed that the phenomenon of bacterial luminescence loss produced by radiation will contribute to clinical radiation dosimetry and research. (5 refs.)

68986 Thresholds in radiobiology. P.R.J.Burch, M.S.Chesters (Dept. of Medical Phys., Univ. of Leeds, Leeds, England).
Phys. Med. & Biol. (GB), vol.28, no.5, p.603-4 (May 1983).
R. Katz and W. Hofman (see ibid., vol.27, p.1187, 1982) attributed to the present authors and others 'suggestions of dose of LET thresholds in radiobiology'. The present authors feel that this statement is ambiguous, and in this reply they clarify their position. (5 refs.)

68987 Interaction of natural radioprotectants and gamma radiation in rabbit erythrocytes. M.Fernandez (Dept. de Fisica, Univ. de Chile, Santiago, Chile), I.Rojo, I.Tomicic, J.Toha.
Radiat. Eff. Lett. (GB), vol.68, no.5, p.131-8 (1983).
The protective capacity of vitamins such as niacinamide, riboflavine, vitamin K, thiamine and cyanocobalamine, the coenzymes NAD and FAD, the electron carrier cytochrome c and mixtures of these compounds in a molar concentration range between 10^{-6} M and 10^{-4} M were studied on gamma irradiated rabbit red blood cells. The dose relative factor (DRF 37) was evaluated by visible absorbancy measurements of the liberated hemoglobin. Some of the best DRF 37 obtained were: cytochrome c: 4.7; riboflavine: 4.0; cyanocobalamine: 3.6; thiamine: 3.5; vitamin K: 2.6; niacinamide: 2.0. (7 refs.)

87.60B Sonic and ultrasonic radiation

68988 Description and application of an ultrasonic Doppler velocimeter for the small vessels. D.Cathignol, J.Y.Chapelon, J.L.Mestas, C.Fourcade (CETAC INSERM, Bron, France).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.358-64 (May 1983). In French.
A detailed description is given of the use of a 20 MHz pulsed Doppler velocimeter. This choice of ultrasonic emission frequency gives axial and lateral resolution of ±0.15 mm. Various applications in vitro and in animal and man justify the development of this type of equipment, both for microsurgery and precision haemodynamic studies. (10 refs.)

68989 Computerized tomography with ultrasound. J.F.Greenleaf (Dept. of Physiology & Biophys., Mayo Foundation, Rochester, MN, USA).
Proc. IEEE (USA), vol.71, no.3, p.330-7 (March 1983).
The mathematical basis for transmission computed tomographic imaging using straight-line reconstruction equations is discussed. Both narrow-band and broad-band solutions are described. The Born and Rytov methods are discussed and the Rytov inversion equation presented with some results. Problems with implementation of the method are mentioned. Backscatter reconstruction methods of seismology are discussed as to their strengths and weaknesses for use in tissue imaging. (35 refs.)

68991 Use of an ophthalmoscope for objective refraction of noncooperative patients. J.E.Richman, R.P.Garzia (Coll. of Optometry, Ferris State Coll., Big Rapids, MI, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.329-34 (April 1983).
Refractive ophthalmoscopy was performed on 16 subjects aged 5 to 27 years. Subjective refractions were performed on both eyes on the subjects followed by an ophthalmoscopic determination performed under cyloplegia by the authors. A 0.94 correlation was found between the subjectively determined 'dry' refractive error and the refractive error determined ophthalmoscopically under cycloplegia by both examiners. The results of the two procedures differed by 1D or less 82% of the time. The results indicate that refractive ophthalmoscopy is an alternative method for objectively determining refractive error in noncooperative patients with poor fixational stability. (14 refs.)

68992 Characteristics of a video-type pupillometer. K.M.Daum (Coll. of Optometry, Ohio State Univ., Columbus, OH, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.335-8 (April 1983).
In using a video-type pupillometer, the adjustment of the clipping level, the illumination of the target, the focus of the camera, and the viewing angle have been shown to affect the measurement. The focus of the camera and the viewing angle are the most important variables. The precision of this instrument can be as good as 0.01 mm. The accuracy of the instrument is good with regard to clinical standards: however, all measurements vary slightly from the known value. Interexaminer variation appears to be small. (3 refs.)

68993 On the measurement accuracy of the tissue permittivity in vivo. A.Kraszewski (Dept. of Electrical Engng., Univ. of Ottawa, Ottawa, Ontario, Canada), S.S.Stuchly, M.A.Stuchly, S.A.Symons.
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.37-42 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
An open-ended coaxial line sensor and a computer-controlled network analyzer have been extensively used for measuring the tissue permittivity in vivo at radio and microwave frequencies. An analysis is presented of measurement errors resulting from calibration and random errors of the network analyzer. The uncertainties in the system investigated are $\Delta\Gamma$=0.05 dB and $\Delta\phi$=0.3°. (11 refs.)

68994 Evaluation system for absolute brightness from the retinal vessels. C.Bosi, M.Neroni, P.Chistolini, R.Bedini (Lab. of Ingegneria Biomedica, Istituto Superiore di Sanita, Roma, Italy).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.291-4 (May 1983).
Describes a method for the absolute evaluation of the luminance of a photographic image of the fundus, based on a comparison between this image and a referred grey scale. The absolute measurements of the luminance of the particular on the film are performed by a microprocessor-controlled microfilm reader. This new method can be applied in general studies regarding the fundus of the eye in particular for studying retinal diseases caused by hypertension and diabetes. (6 refs.)

68995 An introduction to NMR imaging: from the Bloch equation to the imaging equation. W.S.Hinshaw, A.H.Lent (Technicare Corp., Solon, OH, USA).
Proc. IEEE (USA), vol.71, no.3, p.338-50 (March 1983).
The emerging technology of NMR imaging is introduced as a problem in system identification. The authors show how selected families of signals may be input into the system ('system,' in this case, is almost synonymous with 'patient') in order that the system's responses to these inputs may be directly interpreted in terms of the system parameters. Once identified, a raster display of the system parameters provides an internal image of the patient. Inputs to the system are four-component functions of time. One component decribes the strength of an RF signal, and the other three components govern the strength of three spatially varying, independently controlled magnetic fields (the gradient fields) in which the patient is immersed. In response to these inputs some of the protons in the patient, acting in concordance with the Bloch equation, give rise to local fluctuations in the magnetization which are detectd with a tuned antenna and a sensitive receiver. The relationship between this output signal and the system parameters is summarized in the imaging equation. (22 refs.)

Fiber-optic diaphragm-curvature pressure transducer .... See Entry 66398

Mathematical problems of computerized tomography .... See Entry 69044

87.60J Corpuscular radiation and radioisotopes

(inc. X-rays and gamma-rays)

68996 Signal processing in digital radiography. W.R.Brody (Stanford Univ., Stanford, CA, USA).
Trends & Perspect. Signal Process. (USA), vol.3, no.1, p.1-8 (March 1983).
Discusses the introduction of computerized axial tomography (CAT or CT) which in 1972 paved the way for widespread application of digital signal processing in medical X-ray imaging. The decreasing costs for digital processing and storage and the potential for increased speed and information density offered by digital technology will soon bring about the replacement of conventional film-based radiography with digital techniques. (no refs.)

68997 The computer increases the sharpness of X-ray diagnosis. G.Svahn.
Eltek. Aktuell Elektron. (Sweden), vol.26, no.6, p.16-18 (April 1983). In Swedish.
Describes the characteristics of X-ray film and the need to enhance both sharpness and contrast. Enhancement as introduced in the 'sixties using cine

or video systems is described. Digital radiography using a processor is explained. The author writes that such techniques give a great number of options in altering and diagnosing plates. Contrast enhancement is described in some detail. The author concludes with the view that the use of film will be entirely replaced by digital techniques in the next 5-10 years. (no refs.) *H.J.P.*

68998 Estimates of kidney volume by single photon emission tomography: a preliminary report. W.N.Tauxe (Div. of Nuclear Medicine, Univ. of Alabama Hospitals, Birmingham, AL, USA), A.Todd-Pokropek, F.Soussaline, C.Raynaud, C.Kellershohn.
Eur. J. Nucl. Med. (Germany), vol.8, no.2, p.72-4 (1983).
Algorithms for the estimation of organ volumes have been developed which may provide whole organ volumes and which may or may not, at the operator's choice, take into account any voids which may be contained within the organ. These algorithms have been applied to the estimation of the volume of the kidneys, in normal subjects and in patients with renal disease. The dimensions of the kidneys were similar to those derived from ultrasound study measurements which were performed independently. Kidney volume should prove especially useful in the diagnosis of early graft rejection and in the diagnosis of glomerulonephritis. (7 refs.)

68999 Fully automated sectorial equilibrium radionuclide ventriculography. Proposal of a method for routine use: exercise and follow-up. R.Standke, G.Hor, F.-D.Maul (Dept. of Radiology, J.W. Goethe-Univ., Frankfurt/Main, Germany).
Eur. J. Nucl. Med. (Germany), vol.8, no.2, p.77-83 (1983).
A fully automated computer program is described for processing equilibrium radionuclide ventriculography data with regard to gobal and sectorial left ventricular ejection fraction. The precise identification of the left ventricular outline, a prerequisite for reproducible determination of sectorial ejection fraction, was achieved by using morphological and functional criteria in a sequential edge detection technique. The high reproducibility of this method (correlation coefficient r: global ejection fraction $r=0.96$, sectorial ejection fraction $r=0.82=0.97$) allows the evaluation of a mean normal sectorial ejection fraction profile and its adaptation to the individual left ventricle. Computerized comparison between individual and adjusted normal sectorial ejection fraction permits quantitation of the degree of localization of functional impairment at rest, sectorial comparison between ejection fraction at rest and during peak exercise is used for the detection of ischemic functional impairment. The success rate of end diastolic left ventricular edge detection of 96% and the processing time of 150 s makes this method suitable for routine use. (25 refs.)

69000 Measurement of changes of blood flow in renal transplants. S.V.Ellam, M.N.Maisey, R.Mistry (Guy's Hospital, London, England).
Eur. J. Nucl. Med. (Germany), vol.8, no.2, p.84-6 (1983).
An accurate, reproducible method for calculating an index of renal blood flow from a dynamic ^{99m}Tc-labelled DTPA transplant study is described. The inter- and intra-variability of the method has been assessed. (3 refs.)

69001 Performance of neutron radiography systems using particle accelerators. J.A.Stokes, L.A.Parks, C.A.Preskitt, J.John (IRT Corp., San Diego, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1623-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The most crucial element of building a useful neutron radiography system is an intense source of neutrons. Among nuclear reactions employing accelerators, the ^{9}Be(d,n)^{10}B reaction is probably the best method for generating neutrons for radiography. This is due to its superior yield of neutrons that can be efficiently moderated and very low gamma-ray contamination. This has been demonstrated using a KN-4000 Van de Graaff accelerator coupled to an IRT Model ANR-100 moderator-collimator assembly, and excellent quality radiographs have been obtained. The Radio Frequency Quadrupole Linear Accelerator is found to be capable of providing an intense source of neutrons using the same reaction and is recommended for neutron radiography applications. (9 refs.)

69002 Element-sensitive computed tomography with fast neutrons. J.C.Overley (Phys. Dept., Univ. of Oregon, Eugene, OR, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1677-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The author demonstrates that energy-sensitive neutron transmission measurements can be used in conjunction with computed tomography to determine spatial distributions of specific elements in a sample containing elements of biological interest. A neutron continuum with energies up to 8.6 MeV is produced by ^{9}Be(d,n)^{10}B reactions in a thick target. The neutrons are collimated to a narrow beam and are used in a translate-rotate scan of the sample. Pulsed beam time-of-flight techniques are used to measure neutron transmission through the sample. Structure in the energy dependence of the transmission is used to determine the amounts of various attenuating elements encountered by the beam. These quantities are used in tomographic reconstructions of the sample. (5 refs.)

69003 Positron production and PET scanning. R.D.Hichwa (Cyclotron/PET Facility, Univ. of Michigan Medical School, Ann Arbor, MI, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1688-92 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A new program to study anatomical and physiological aspects of the brain that use positron emission tomographic (PET) techniques was instituted at the University of Michigan. A complete laboratory was constructed to facilitate the production of radiotracers, their incorporation into viable radiopharmaceuticals and the detection of their regional localization. The Cyclotron Corporation (TCC) CS-30 compact cyclotron is used to provide various short-lived $\beta+$nuclides. The TCC 4600A Neuro Positron Camera Tomograph is used to obtain transaxial images of the brain derived from the annihilation photons of the $\beta+$ tracers. The scanner resolution is 1.0 cm by 1.0 cm within the slice and 1.0 cm between slices. The tomograph is capable of simultaneously acquiring 5 slices in 5 seconds at the maximum spatial resolution. (15 refs.)

69004 Advanced medical accelerator design. J.R.Alonso, T.Elioff, A.Garren, R.A.Gough, H.A.Grunder, H.Lancaster, S.Magyary, V.More, R.Sah, J.Staples, R.Yourd (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1762-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
This report describes the design of an advanced medical facility dedicated to charged particle radiotherapy and other biomedical applications of relativistic heavy ions. Project status is reviewed and some technical aspects discussed. Clinical standards of reliability are regarded as essential features of this facility. Particular emphasis is therefore placed on the control system and on the use of technology which will maximize operational efficiency. The accelerator will produce a variety of heavy ion beams from helium to argon with intensities sufficient to provide delivered dose rates of several hundred rad/minute over large, uniform fields. The technical components consist of a linac injector with multiple PIG ion sources, a synchrotron and a versatile beam delivery system. An overview is given of both design philosophy and selected accelerator subsystems. Finally, a plan of the facility is described. (4 refs.)

69005 The neutron therapy facility at the University of Pennsylvania-Fox Chase Cancer Center. P.Bloch, R.Larsen, J.Chu (Dept. of Radiation Therapy, Univ. of Pennsylvania-Fox Chase Cancer Center Hospital School of Medicine, Philadelphia, PA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1788-92 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The fusion of deuterium and tritium nuclei results in the formation of a helium-4 nucleus and a 14 MeV neutron. This reaction readily takes place when deuterium and tritium ions are accelerated to potentials between 150-200 kV. These energy ions can be obtained in a moderate size accelerator. A DT neutron facility has been installed in the radiation therapy department of the University of Pennsylvania Hospital-Fox Chase Cancer Center. The system is being commissioned in a hospital setting to test the efficacy of fast neutron radiotherapy. (15 refs.)

69006 Heavy ion radiotherapy at the Lawrence Berkeley Laboratory. G.T.Y.Chen, J.R.Castro, J.M.Collier, W.M.Saunders (Biology & Medicine Div., Lawrence Berkeley Lab., Berkeley, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1813-15 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, ~~8-10~~ Nov. 1982).
Heavy ion radiotherapy potentially offers both dose localization and biologic advantages over conventional radiations in the treatment of cancer. Approximately 400 patients have been treated with either helium, carbon, neon, argon or silicon beams. Aspects of particle therapy are reviewed. Experience with these beams have defined parameters required of a hospital based heavy ion machine. A design study of such a machine is now underway at LBL. (10 refs.)

69007 Liquid scintillation counting—perils and pitfalls.
Lab. Equip. Dig. (GB), vol.21, no.4, p.81-5 (April 1983).
Liquid scintillation counting is an extremely sensitive analytical technique for detecting and measuring radioactive decay, especially of the low energy beta emitters such as phosphorus-32, tritium and carbon-14. It is widely used in a variety of biomedical applications including research work in biochemistry and molecular biology, pharmaceutical research and quality control, and clinical investigations as well as environmental monitoring of radioactivity. However, for valid interpretation of experimental data, an understanding of the physical process, the instrumental operation of the LS counter and the techniques of sample preparation is vital. The aim of the article is to give a general overview. (no refs.)

69008 Image quality evaluation of a digital fluorographic imaging device. Pei-Jan Paul Lin, R.A.Mintzer, H.L.Neiman (Dept. of Radiology, Northwestern Univ. Medical School, Chicago, IL, USA).
Opt. Eng. (USA), vol.22, no.2, p.256-9 (March-April 1983).
A low contrast phantom designed specifically for the evaluation of the image quality obtained from a digital fluorographic imaging device (DFID) is described. The design rationale and the image quality evaluation procedure utilizing the phantom are discussed along with the test results. (3 refs.)

69009 Applications of computerized tomography to diagnostic radiology. L.Axel, P.H.Arger, R.A.Zimmerman (Dept. of Radiology, Hospital of the Univ. of Pennsylvania, Philadelphia, PA, USA).
Proc. IEEE (USA), vol.71, no.3, p.293-7 (March 1983).
Computerized tomography (CT) has revolutionized the practice of diagnostic radiology. The combination of greatly improved ability to distinguish between regions of similar X-ray absorption and the ability to separate overlying regions from each other has made possible the radiographic demonstration of many organs and disease processes that previously could be, at best, poorly demonstrated. CT of the brain has greatly decreased the need for the dangerous and uncomfortable procedures that were previously required to image the brain. It has also improved imaging capabilities in many other areas of the body, and thus decreased the need for other, more dangerous, imaging techniques. The authors briefly discuss how CT has extended conventional diagnostic radiology and present some examples of its usefulness in neurological and other diseases. (11 refs.)

69010 Cardiac computed tomography. D.P.Boyd, M.J.Lipton (Dept. of Radiology, School of Medicine, Univ. of California, San Francisco, CA, USA).
Proc. IEEE (USA), vol.71, no.3, p.298-307 (March 1983).
Diseases of the heart and blood vessels represent one of the most challenging problems for advanced diagnostic imaging systems. Not only do these diseases represent the major medical problem to our time in terms of death, acute and chronic illness, and disability, but cardiac diagnosis involves complex technical difficulties due to rapid motion and the complex structure of the heart and cardiovascular system. Computerized-tomographic scanning is potentially an ideal cardiac imaging modality since CT is a cross-sectional imaging method with potentially very high resolution. Currently available CT scanners have exposure speeds in the range of 1-5 s, a speed that is inadequate for the majority of cardiovascular imaging applications. Nevertheless, a variety of limited CT scanning techniques have been successfully applied to selected imaging problems. These methods involve the use of contrast media injected into the blood combined with either dynamic CT scanning or gated CT scanning. The authors describe the CVCT scanner, under development at the University of California, San Francisco, which will image up to 8 contiguous slices at a rate of 36-54 images per second. The technical feasibility of the CVCT has been demonstrated using a testbed simulation of the scanning-beam configuration. The completed prototype scanner is expected to be available for testing early in 1983. (54 refs.)

69011 High-speed three-dimensional X-ray computed tomography: the dynamic spatial reconstructor. R.A.Robb, E.A.Hoffman, L.J.Sinak, L.D.Harris, E.L.Ritman (Dept. of Physiology & Biophys., Mayo Clinic, Rochester, MN, USA).
Proc. IEEE (USA), vol.71, no.3, p.308-19 (March 1983).
Most X-ray CT scanners require a few seconds to produce a single two-dimensional (2-D) image of a cross section of the body. The accuracy of full three-dimensional (3-D) images of the body synthesized from a contiguous set of 2-D images produced by sequential CT scanning of adjacent body slices is limited by (1) slice-to-slice registration (positioning of patient); (2) slice thickness; and (3) motion, both voluntary and involuntary, which occurs during the total time required to scan all slices. Therefore, this method is inadequate for true dynamic 3-D imaging of moving organs like the heart, lungs and circulation. To circumvent these problems, the dynamic spatial recon-

structor (DSR) was designed by the Biodynamics Research Unit at the Mayo Clinic to provide synchronous volume imaging, that is stop-action (1/100 s), high-repetition rate (up to 60/s), simultaneous scanning of many parallel thin cross sections (up to 240, each 0.45 mm thick, 0.9 mm apart) spanning the entire anatomic extent of the bodily organ(s) of interest. These capabilities are achieved by using multiple X-ray sources and multiple 2-D fluoroscopic video camera assemblies on a continually rotating gantry. (39 refs.)

69012 Single-photon emission computed tomography. G.F.Knoll (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA).
Proc. IEEE (USA), vol.71, no.3, p.320-9 (March 1983).
The subject of single-photon emission computed tomography (SPECT) is generally reviewed. The basic interaction processes of gamma rays in matter are outlined, and the formation of conventional gamma-ray images is described. The extension of these concepts to the formation of three-dimensional or tomographic images is outlined. Of particular concern in emission tomography, the effects of gamma-ray attenuation and scattering are outlined. Several examples are given of practical SPECT systems, and representative results are given. (23 refs.)

69013 Application of computerized tomography to radiation therapy and surgical planning. P.Bloch (Dept. of Radiation Therapy, Hospital of the Univ. of Pennsylvania, Philadelphia, PA, USA), J.K.Udupa.
Proc. IEEE (USA), vol.71, no.3, p.351-5 (March 1983).
Computerized tomography (CT) which permits imaging the internal anatomy in axial cross section, has had a major impact in medicine, primarily in the diagnostic area. The CT scans are also useful in determining the extent of disease which is important in selecting the appropriate therapy. For therapy, the CT scan is becoming important in planning a course of radiation therapy for a cancer patient and to a lesser extent, in planning a surgical reconstruction for some patients. For both of these treatment modalities it would be desirable to have a three-dimensional reconstruction of the internal anatomy. This paper discusses the use of a three-dimensional perspective of the internal anatomy, obtained from multiple CT scans, as a guide to these two therapeutic modalities. (17 refs.)

69014 Overview of computerized tomography with emphasis on future developments. R.H.T.Bates, K.L.Garden (Dept. of Electrical Engng., Univ. of Canterbury, Christchurch, New Zealand), T.H.Peters.
Proc. IEEE (USA), vol.71, no.3, p.356-72 (March 1983).
The applications of computer-assisted, or comput(eriz)ed, tomography (CT) are reviewed. The major emphasis is on medical applications, but all relevant technical sciences are covered. A unified descriptive account of the underlying principles is presented (detailed reviews of algorithms and their mathematical backgrounds can be found elsewhere in this special issue). Deficiencies in existing hardware and software are identified and the possible means of remedying the more urgent of these are outlined. Promising approaches for future research and development into CT are suggested. (166 refs.)

69015 Physical problems of computerized tomography. A.Macovski (Dept. of Electrical Engng., Stanford Univ., Stanford, CA, USA).
Proc. IEEE (USA), vol.71, no.3, p.373-8 (March 1983).
A cross-sectional image of an object can be accurately reconstructed if its projections or line integrals are known at all angles. This fundamental and exciting property has been applied to a variety of applications, primarily in the area of medical imaging. In many cases, however, the physical measurements fail to accurately define the complete set of line integrals. This leads to inaccuracies and distortions in the resultant reconstruction. The physical measurements can be inadequate in a number of ways. These include nonlinearities, noise, and insufficient data. The nonlinearities can arise from a nonlinear detector process, or the inability to accurately extract the information in the exponent by taking logs. The noise can be the usual statistical uncertainty of the measurement or an interfering component such as scatter. The data can be insufficient in a number of ways including inadequate sampling or regions of missing data. Also, the measurements of a source distribution can be distorted by an unknown attention distribution, resulting in errors in the reconstruction. (34 refs.)

69016 Reconstruction algorithms: transform methods. R.M.Lewitt (Dept. of Radiology, Hospital of the Univ. of Pennsylvania, Philadelphia, PA, USA).
Proc. IEEE (USA), vol.71, no.3, p.390-408 (March 1983).
Transform methods of image reconstruction from projections are based on analytic inversion formulas. In this tutorial paper, the inversion formula for the case of two-dimensional (2-D) reconstruction from line integrals is manipulated into a number of different forms, each of which may be discretized to obtain different algorithms for reconstruction from sampled data. For the convolution-backprojection algorithm and the direct Fourier algorithm the emphasis is placed on understanding the relationship between the discrete operations specified by the algorithm and the functional operations expressed by the inversion formula. The performance of the Fourier algorithm may be improved, with negligible extra computation, by interleaving two polar sampling grids in Fourier space. The convolution-backprojection formulas are adapted for the fan-beam geometry, and other reconstruction methods are summarized, including the rho-filtered layergram method, and methods involving expansions in angular harmonics. A standard mathematical process leads to a known formula for iterative reconstruction from projections at a finite number of angles. A new iterative reconstruction algorithm is obtained from this formula by introducing one-dimensional (1-D) and 2-D interpolating functions, applied to sampled projections and images, respectively. (102 refs.)

69017 Finite series-expansion reconstruction methods. Y.Censor (Hospital of the Univ. of Pennsylvania, Philadelphia, PA, USA).
Proc. IEEE (USA), vol.71, no.3, p.409-19 (March 1983).
Series-expansion reconstruction methods made their first appearance in the scientific literature and in the CT scanner industry around 1970. Great research efforts have gone into them since but many questions still wait to be answered. These methods, synonymously known as algebraic methods, iterative algorithms, or optimization theory techniques, are based on the discretization of the image domain prior to any mathematical analysis and thus are rooted in a completely different branch of mathematics than the transform methods which are discussed in this issue by Lewitt (see ibid., vol.71, no.3, p.390-408, 1983). How is the model set up? What is the methodology of the approach? Where does mathematical optimization theory enter? What do these reconstruction algorithms look like? How are quadratic optimization, entropy optimization, and Bayesian analysis used in image reconstruction? Finally, why study series expansion methods if transform methods are so much faster? These are some of the questions that are answered in this paper. (71 refs.)

69018 Wiener spectral effects of spatial correlation between the sites of characteristic X-ray emission and reabsorption in radiographic screen-film systems. C.E.Metz, C.J.Vyborny (Dept. of Radiology, Univ. of Chicago, Chicago, IL, USA).
Phys. Med. & Biol. (GB), vol.28, no.5, p.547-64 (May 1983).
When characteristic X-rays are generated and reabsorbed in the phosphor of a radiographic screen-film system, the positions at which light is emitted from the initial and secondary interactions are correlated. A simple statistical model is developed to account for the effect of this correlation on the Wiener spectrum of quantum mottle. Unlike previous models, which ignore spatial correlation, the new model predicts that not only noise magnitude but also noise texture is changed as the incident X-ray energy exceeds the phosphor K-edge. (18 refs.)

69019 Energy and angular dependence of X-ray absorption and its effect on radiographic response in screen-film systems. Heang-Ping Chan, Kunio Doi (Dept. of Radiology, Univ. of Chicago, Chicago, IL, USA).
Phys. Med. & Biol. (GB), vol.28, no.5, p.565-79 (May 1983).
The relationship between the film density and the X-ray energy absorbed in the screens, and the effect of the components of a screen-film system on X-ray absorption in the screen phosphor has been studied. It is concluded that, to a good approximation, the total absorbed X-ray energy can be calculated ignoring components other than the phosphor, and that the absorbed energy is related to the film density through the characteristic curve of the film. This simple relationship provides a basis for the theoretical prediction of the radiographic performance of an imaging system. Analytical expressions have been derived for the energy absorbed in model screens, containing one or two high-atomic-number elements. For incident energies above the K-edge of the high-Z elements, the contribution of the K X-rays to energy absorption was included by the use of a K-reabsorption factor. This factor was determined for eight screen pairs as a function of incident photon energy and incident angle. (20 refs.)

69020 A comparison of rotating slant hole collimator and rotating camera for single photon emission tomography of the heart. M.J.Myers (Dept. of Medical Phys., Hammersmith Hospital, London, England), E.B.Sokole, J.de Bakker.
Phys. Med. & Biol. (GB), vol.28, no.5, p.581-8 (May 1983).
Measurements were made on the tomographic imaging abilities of a rotating slant hole collimator and a rotating scintillation camera system using a standard heart phantom and thallium-201. This allowed a comparison to be made between these and published results for conventional imaging and the seven pinhole technique under standardised conditions. Although better intraplanar resolutions were obtained with the rotating slant hole, the rotating camera was found to give superior definition of a defect and less propagation between reconstructed sections of the phantom. 69021 The production of spallation radionuclides for medical applications at BLIP. L.F.Mausner, P.Richards (Medical Dept., Brookhaven Nat. Lab., Upton, NY, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1793-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The Brookhaven LINAC isotope producer (BLIP) is the first facility to demonstrate the capability of a large linear accelerator for efficient and economical production of difficult-to-make, medically useful radionuclides. It utilizes the excess beam capacity of a LINAC that injects 200 MeV protons into the 33 GeV Alternating Gradient Synchrotron. The linac provides an integrated beam current of 60 μA for radionuclide production. The basic target types are encapsulated salt pellets, gases, and metallic foils. The medically important isotopes ^{123}I, ^{81m}Kr, ^{52}Fe, and ^{127}Xe are routinely produced. These and other potentially important radionuclides can result in improved diagnostic and therapeutic procedures in nuclear medicine with reduced patient dose, and lead to a better understanding of physiological processes in health and disease. (2 refs.)

69022 Cyclotron production of no-carrier-added medical radionuclides. M.C.Lagunas-Solar (Crocker Nuclear Lab., Univ. of California, Davis, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1805-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Charged-particle accelerators, particularly cyclotrons, are presently the source of the majority of the radionuclides used for the synthesis of radioactive drugs. These drugs are then used in clinical research and in diagnostic nuclear medicine. The physical properties of the accelerator-made radionuclides, the chemical characteristics of their drug formulations, and their biological properties are significant factors affecting the radioactive drug's quality and effectiveness in the diagnostic procedure. Because of their ultimate application in nuclear medicine, both cyclotron and radiochemical methods used in their production, purification, and formulation must be suited to render a radioactive drug of the highest purity, in terms of radionuclidic, radiochemical, chemical, and biological quality. (19 refs.)

69023 I-123 labeled radiotracers in cardiovascular nuclear medicine. P.V.Kulkarni (Dept. of Radiology, Univ. of Texas Health Sci. Center, Dallas, TX, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1809-12 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Radiohalogens produced in a cyclotron are nuclides of choice for radiopharmaceuticals. I-123 labeled substrates suitable for imaging the myocardium include receptor binding agents, muscarinic antagonists and analogs of fatty acids. Radioiodinated (I-123) fatty acid analogs have gained significant attention because of the possibility that these might give quantiative information regarding the regional myocardial metabolic activity by noninvasive scintigraphic methods. Incorporation of tellurium hetero into a carbon skeleton or beta methylation of a long chain phenyl fatty acid tends to prolong the retention of radioactivity in the myocardium of experimental animals. It is recognized that the radioiodine needs to be placed on a phenyl ring attached (in the ω-position) to a long chain fatty acid for the invivo stability of the C-I-bond. Among the methods of radioiodination of ω-phenyl fatty acids, a method developed in the author's laboratory using an organo-thallium intermediate has been found to be simple, efficient, reproducible, and suitable for routine application. (25 refs.)

69024 Status and prospects of the production of radioisotope-tagged compounds in the USSR. E.I.Mikerin.

Sov. At. Energy (USA), vol.53, no.2, p.544-5 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.89-91 (Aug. 1982). [received: April 1983]

The author reviews the range of available radioisotope-tagged compounds and their production in the USSR. The isotopes discussed include ^{14}C, ^{3}H, and ^{32}P. (no refs.)

87.60M Radiation dosimetry

69025 Mammalian spermatogenesis as a new system for biologic dosimetry of ionizing irradiation. U.Hacker, J.Schumann, W.Gohde (Dept. of Experimental Tumor Res., Hornheide Clinic, Univ. of Munster, Munster, Germany).

Acta Radiol. Oncol. Radiat. Therapy Phys. & Biol. (Sweden), vol.21, no.5, p.349-51 (1982).

The radiation induced reduction of the number of DNA synthesizing cells (spermatogonia) is described using the fast-working flow cytophotometer. Since there is no shoulder in the initial part of the dose response curve this model of biologic dosimetry is very sensitive. The D_{50} value is 0.25 Gy; a radiation exposure of only 0.1 Gy can be detected. (17 refs.)

69026 A lyoluminescent tissue-equivalent dosemeter for pion therapy beams. N.A.Atari, S.R.Malik (Dept. of Phys., Kuwait Univ., Safat, Kuwait), D.J.Brenner, R.Hilko, J.N.Bradbury.

Phys. Med. & Biol. (GB), vol.28, no.5, p.493-502 (May 1983).

The light emitted when pion irradiated glucose is dissolved in luminol solution has been found to be proportional to the pion beam depth dose distribution in water as determined by a TE ionisation chamber. The lyoluminescence of glucose overlaps very closely with the response profile of the ionisation chamber to the 170 MeV/c π^- mesons giving a Bragg peak to plateau ratio of 3:1. In comparison, the thermoluminescence response of LiF (TLD-700) to pions has been found to be deviate significantly from this ratio. The close tissue equivalence of glucose, non-toxicity and its excellent lyoluminescent retention properties are important advantages over currently used dosemeters in clinical pion therapy, especially when direct in vivo measurements are considered. Pion doses ranging between 0.5 Gy (50 rad) and 30 Gh (3000 rad) were measured with an accuracy ±5% and reproducibility 3-5%. (24 refs.)

69027 Dosimetry with tissue-equivalent ionisation chambers in fast neutron fields for biomedical applications. J.Zoetelief, J.J.Broerse (Radiobiological Inst., Rijswijk, Netherlands).

Phys. Med. & Biol. (GB), vol.28, no.5, p.503-20 (May 1983).

The use of calibrated issue-equivalent (TE) ionisation chambers is commonly considered to be the most practical method for total absorbed dose determinations in mixed neutron-photon fields for biomedical applications. The total absorbed dose can be derived from the charge produced within the cavity of an ionisation chamber employing a number of physical parameters. To arrive at the charge produced in the cavity several correction factors have to be introduced which are related to the operational characteristics of the chambers. Information on the operational characteristics of four TE ionisation chambers is presented in relation to the ion collection, density and composition of gas in the cavity, wall thickness and effective point of measurement. In addition, some recent results from an ionisation chamber operated at high gas pressures (up to 8 MPa(80 bar)) are presented. The total chamber operated at high gas pressures (up to 8 MPa(80 bar)) are presented. The total absorbed doses derived from TE ionisation chambers show agreement within the uncertainty limits with results from other independent dosimetry methods, i.e., differential fluence measurements and a TE calorimeter. Conscientious experimentation and a common data base can provide dosimetry results with TE ionisation chambers with variations of less than ±2%. (40 refs.)

69028 A theoretical concept for measuring doses from external radiation sources in radiation protection. B.R.L.Siebert, R.Hollnagel, R.Jahr (Phys. Tech. Bundesanstalt, Braunschweig, Germany).

Phys. Med. & Biol. (GB), vol.28, no.5, p.521-33 (May 1983).

A physically consistent concept is presented for monitoring individual exposures from external radiation, giving quantitative relations between dosemeter readings, doses in an arbitrary phantom (receptor doses) and receptor-free radiation field quantities. As a consequence, the aim of the design for the construction of dosemeters consisting of one or several detectors can be formulated mathematically. A distinction is made between 'fitted' dosemeters satisfying this relation, and 'non-fitted' dosemeters which do not. The calibration of both types is discussed in detail. For non-fitted dosemeters, procedures to determine the error limits are given. The application to accident dosimetry is briefly discussed. (14 refs.)

69029 Experience from application of radiolyoluminescence and electron paramagnetic resonance to dosimetry of accidental irradiation. I.A.Alekhin, S.P.Babenko, S.N.Kraitor, K.K.Kushnereva, A.V.Barabanova, S.R.Ginzburg, R.D.Drutman, V.N.Petushkov.

Sov. At. Energy (USA), vol.53, no.2, p.546-50 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.91-5 (Aug. 1982). [received: April 1983]

It was proposed that the dose from accidental irradiation be measured by using radiolyoluminescence (RLL), i.e. the luminescence which occurs during the dissolution of samples of human biological tissue (hair, nails), clothing, documents, and other objects which accompany a person under the conditions of an accident. Radiolyoluminescence is caused by free radicals which are formed when organic substances are irradiated, which can be detected by the method of electron paramagnetic resonance (EPR). The authors made a comparative study of the EPR and RLL of human hair, cotton fabric used to make protective clothing for the personnel of sections with an accident hazard, as well as synthetic and woollen fabrics used in everyday clothing. They investigated the characteristics of RLL and EPR which are of interest for dosimetry of accidental irradiation. For the first time, RLL and EPR have been used to measure the dose of accidental irradiation of accelerator personnel. (3 refs.)

87.70 BIOMEDICAL ENGINEERING

69031 Inadequate dynamic response of catheter-transducer systems, a source of error in direct blood pressure measurement. W.Schilt (Univ. Bern, Bern, Switzerland).

Biomed. Tech. (Germany), vol.28, no.5, p.112-17 (May 1983). In German.

The dynamic response of a catheter-transducer system for direct measurement of blood pressure, currently used in intensive care units, has been evaluated. Simulated pressure signals of the aortic and pulmonary artery type revealed an undamped frequency of 5.17 cps, and a damping factor of 0.25 s. Measurements of absolute values of systolic pressure were too high by 22% and 27% for the aortic and pulmonary signal, respectively. Corresponding diastolic values were too high by 4% and 18%, respectively. The phase lag for both signal types approached 4-5% of the pulse duration. Quantitative errors of pressure measurement at the bedside must be expected if current catheter-transducer systems with long connection lines are not specifically adapted for dynamic response. (11 refs.)

69032 Brain function monitoring: a new method for simultaneous recording and processing of EEG-power spectra and brainstem potentials (BAEP). H.Maresch, G.Pfurtscheller, S.Schuy (Inst. fur Elektro- und Biomedizinische Tech., Tech. Univ. Graz, Graz, Austria).

Biomed. Tech. (Germany), vol.28, no.5, p.117-22 (May 1983).

Brainstem auditory evoked potentials (BAEP) and compressed EEG spectra are both valuable tools for brain function monitoring. The simultaneous recording and online evaluation of both signals from the same derivations was established on a microcomputer system, permitting a continuous observation of the patient. The filtering of the brainstem potentials was done by online computation of digital filters in the frequency domain. First applications to healthy subjects and patients during carotid endarterectomy under hyperbaric conditions were performed. (8 refs.)

69033 A PDP-11 assembly language program for digitizing, sorting, and averaging evoked brain potentials. A.L.Schmidt (Div. of Neurosurgery, Univ. of Texas Medical Branch, Galveston, TX, USA).

Behav. Res. Methods & Instrum. (USA), vol.15, no.1, p.85-6 (Feb. 1983).

Describes a computer program to average single-trial evoked brain potentials (EPs) and perform later data manipulation and analysis. The program is an advance on previous methods because it eliminates the need to process data more than once. It uses the MACRO-11 assembly language on a DEC PDP-11. The operations carried out are digitizing, sorting and averaging. (6 refs.)

69034 Design and status of a specialized cyclotron for positron tomography. R.R.Highfill (Orbit Inc., Oak Ridge, TN, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1765-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

A specialized, small cyclotron has been developed for the sole objective of producing the principle isotopes used in positron tomography. The following features make it advantageous for clinical applications: 1) It is capable of producing high activity levels of the proper precursor chemical forms: 2) It is much smaller than other cyclotrons, having only slightly more than half the energy of the next smallest model in general use; 3) It is automated to operate under microprocessor control; 4) Its vertical beam plane design permits the external targetry to be recessed into the floor to minimize the amount of bulky neutron shielding material that must be added to the room; 5) It is a single particle accelerator, which simplifies the design and reduces the operational requirements; and 6) The translation of the cyclotron to various target positrons permits the targetry with its many plumbing, gas transfer and electrical connections to remain stationary. (8 refs.)

69035 Therac 25: a new medical accelerator concept. T.Taylor, G.Van-Dyk (AECL, Kanata, Ontario, Canada), L.W.Funk, R.M.Hutcheon, S.O.Schriber.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1768-71 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
An electron linear accelerator system with several novel features has been developed for radiation therapy. The beam from a 25 cell S-band standing wave structure, operated in the $\pi/2$ mode with on-axis couplers is reflected in an achromatic isochronous magnet and reinjected into the accelerator. The second pass doubles the energy while conserving RF power and minimizing the overall length of the unit. The beam is then transported through an annular electron gun and bent into the collimator by an innovative two-element doubly achromatic doubly focusing 270° magnet which allows a significant reduction in unit height. The energy is reduced by adjusting the position of the reflecting magnet with respect to the accelerator. The system generates 5 Gy m^2 min^{-1} beams of 25 MV photons and 5 to 25 MeV electrons. Extensive use of tungsten shielding minimizes neutron leakage. The photon mode surface dose is reduced by a carefully optimized electron filter. An improved scanning system gives exceptionally low electron-mode photon contamination. (7 refs.)

69036 A simple method of measuring the footsole pressure of normal subjects using Prescale pressure-detecting sheets. H.Aritomi, M.Morita, K.Yonemoto (Kitasato Univ. School of Medicine, Sagamihara, Japan).
J. Biomech. (GB), vol.16, no.2, p.157-65 (1983).
A simple method of measuring the pressure beneath the footsole was described using 'Prescale' pressure detecting sheets. These are two sheets, one coated with microcapsules which contain a color producing agent, and the other coated with a color-developing agent. As the applied pressure determines the amount of microcapsules that rupture, the coloring sheet reveals its density corresponding to the pressure applied. At the application of this method, normal subjects were studied quantitatively on distribution of the pressure beneath the footsole. The results were compared with the structure of the foot as revealed by X-ray examination in order to study the correlation between the two. The clinical benefits and indication of this method were discussed. (8 refs.)

69037 Artefact encountered by the vibration detection system. R.A.B.Mollan, G.W.Kernohan, P.H.Watters (Dept. of Orthopaedic Surgery, Queen's Univ. of Belfast, Belfast, N Ireland).
J. Biomech. (GB), vol.16, no.3, p.193-9 (1983).
The use of piezo-electric accelerometers to detect sounds and vibrations emitted from joints and tissues is a significant advance on acoustic detection systems. All possible sources of artefact signal encountered by the vibration emission technique were investigated. A number of errors could be avoided by good technique. All artefact signals were easily distinguished from true vibration emission. As the accelerometer cables were part of the capacitance system it was concluded that other types of accelerometer should be investigated to reduce cable noise. (5 refs.)

69038 Digital filtering and regression algorithms for an accurate detection of the baseline in ECG signals. F.Bartoli, S.Cerutti, E.Gatti (Dept. of Electronics, Polytech. of Milan, Milano, Italy).
Med. Inf. (GB), vol.8, no.2, p.71-82 (April-June 1983).
A method of analogue and digital filtering is used to diminish the presence of high-frequency noise, while algorithms of linear and nonlinear regression are used to fit the slow drift of the baseline and the low-frequency associated noise. The algorithms are implemented in an experimental program applied to a series of 100 patients whose orthogonal leads (Frank leads) have been recorded at the Cardiopulmonary Physiology Department in the Ospedale Maggiore Ca' Granda in Milan. (18 refs.)

69039 New design for a flexible blood gas catheter and connecting cannula for use with a mass spectrometer. D.T.Delpy (Dept. of Medical Phys. & Bioengng., Univ. Coll. London, London, England).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.259-63 (May 1983).
A design for the manufacture of a flexible blood gas catheter and connecting cannula for use with a mass spectrometer is outlined. The design minimises gas diffusion through the wall of the catheter or cannula by enclosing it in another flexible plastic tube. The annular space between the concentrically arranged tubes is evacuated, thus preventing gas diffusing through the outer tube wall from reaching the inner tubing. Results are presented showing that with this configuration the wall diffusion signal can be reduced to a level similar to that obtained with metal walled catheters and cannulae. (3 refs.)

69040 Microprocessor-based system for the measurement and analysis of an expiratory flow-volume curve. A.H.G.El-Dhaher, H.A.Kaouri (Dept. of Phys., Faculty of Sci., Kuwait Univ., Kuwait), K.Y.Mustafa.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.277-84 (May 1983).
Analogue recording and plotting on an xy plotter of flow-time signals tend to produce inaccurate analysis of respiratory data. To improve on the accuracy of the measurement and reduce the time required for such an analysis a microprocessor-based system has been developed. The system is designed to be easily operated and requires minimum time from the user. It gives the operator an indication of the drift in the transducer based on calibration at a standard flow rate. The system is interactive with the user via a visual display terminal. It offers the user full freedom in selecting the parameters to be measured. The displayed results are calculated from the measured signal and compared with predicted values. Hard copy of the displayed information can be produced upon user command. The software is flexibly designed to allow for any modification or future expansion. (9 refs.)

69041 Monitoring bruxism. P.Stock (Dept. of Electrical Engng., Univ. of Adelaide, Adelaide, Australia), N.G.Clarke.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.295-300 (May 1983).
The parafunctional activity of bruxism is believed to be commonly practised by a high proportion of the population. A technique is described for the amplification of e.m.g. signals resulting from the clenching of masticatory muscles. The analogue voltages produced within the muscles are converted to digital form and processed within a microcomputer for subsequent printout from a teletypewriter. The hardware and software used to obtain bruxing data is described. (3 refs.)

69042 The 'Hollywood gaitrack': a method for measuring temporal and distance factors of gait. M.Knight, S.Nade, W.Ongley (Repatriation General Hospital, Hollywood, Australia).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.306-10 (May 1983).
The Hollywood gaitrack is an inexpensive, portable and accurate system for recording some aspects of how a person walks. The system uses a low-cost microcomputer and provides the results at the time of the test. The system is simple to use, and presents the data in an easily interpreted form. The authors are currently using the system for collection of the time and distance parameters of people recovering from surgery for arthritic hips and knees to characterise the normal patterns of recovery after such forms of treatment. (4 refs.)

69043 Turning points spectral analysis of the interference myoelectric activity. P.J.A.Lago (Grupo de Matematica Aplicada, Univ. do Porto, Porto, Portugal), N.B.Jones.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.333-42 (May 1983).
A new method of computer analysis of the interference myoelectric activity is presented. The technique focuses on the time sequence of turning points of the e.m.g. Preliminary analysis shows that biphasic potentials produce a normalised spectral density of the e.m.g. turning points which is very close to 1.0 except for the low frequencies, whereas the occurrence of polyphasic action potentials is reflected by significant deviations from 1.0 for a wide range of frequencies. Experimental results obtained under sustained voluntary contraction in the human brachii biceps are presented. The observed alterations of the e.m.g. turning points spectral density were found to be in agreement with other independent reports which point to an increase of the number of polyphasic potentials in the e.m.g. with increasing contraction time. It is concluded that e.m.g. turning points spectral analysis is sufficiently selective and that it looks to be a sensible technique for the detection and quantification of the incidence of polyphasic potentials in the interference myoelectric activity. 69044 Mathematical problems of computerized tomography. A.K.Louis, F.Natterer (Inst. fur Numerische und Instrumentelle Math., Univ. Munster, Munster, Germany).
Proc. IEEE (USA), vol.71, no.3, p.379-89 (March 1983).
The data measured in computerized tomography; e.g., the X-ray attenuation in X-ray tomography or the resonance phenomena in nuclear magnetic resonance tomography, have to be processed to produce the pictures on which the diagnostic evaluation of the physician is based. This process consists of the solution of the following mathematical problem. The data depend on the searched-for distribution and this dependence can be described as an integral transform. To produce the final picture amounts to the inversion of the integral transform. This paper is concerned with the description of the integral transforms modeling the different techniques in computerized tomography. Among other things, the following questions are treated. Which numerical problems does one have to encounter in inverting the transforms; e.g., what accuracy in the reconstruction can one expect in dependence on the accuracy of the data. To what extent is a distribution determined by a finite number of measurements. Is it possible to recover the distribution reliably if the data are incomplete. (71 refs.)

69045 Display of 3D information in discrete 3D scenes produced by computerized tomography. J.K.Udupa (Dept. of Radiology, Hospital of the Univ. of Pennsylvania, Philadelphia, PA, USA).
Proc. IEEE (USA), vol.71, no.3, p.420-31 (March 1983).
Imaging modalities such as X-ray computerized tomography (CT), ultrasound CT, and nuclear magnetic resonance CT all produce sequences of slice images of internal structures of medical objects. Effective methods of displaying the D information in such images are essential to aid in both diagnosis and treatment of diseases. Two philosophically different approaches to the display problem have been pursued. In the first approach, 3D information is displayed as a distribution of densities in a 3D space. The second approach extracts, from slice images, information about boundary surfaces of objects which is displayed on a 2D screen. The present paper reviews both of these approaches with particular emphasis on the image and graphics processing aspects of the latter approach. (67 refs.)

87.70G Patient care and treatment

69046 **Problems of haemodynamic monitoring encountered in intensive care.** P.C.Baumann (Univ. Zurich, Zurich, Switzerland).
Biomed. Tech. (Germany), vol.28, no.5, p.105-11 (May 1983).
Invasive hemodynamic monitoring in an intensive care unit may be necessary for evaluating circulatory function, and to provide a basis for controlling therapy. Pressure monitoring using a balloon-tipped pulmonary artery catheter is an important element of such monitoring, and its problems are discussed here. For the patient, insertion of intravascular catheters may represent a certain stress, and complications may occur. Consequently strict criteria should be applied to the indication for hemodynamic monitoring. Since it is used at the bedside—frequently for periods for several days—concessions must be made regarding material, especially catheters. Errors of handling—e.g. calibration if this is not automatic, or in the choice of the zero reference level—are posible, and the interpretation of the data may cause problems. However, the majority of such problems and complications can be avoided or countered by using reliable material, and—even more important—by the care exercised by well-trained personnel charged with supervising the hemodynamic monitoring. (7 refs.)

69047 **Design of a cryogenic surgical instrument.** E.I.Mikulin, A.N.Antonov.
Izv. VUZ Mashinostr. (USSR), no.2, p.149-50 (1983). In Russian.
The temperature field around the cryogenic surgical instrument is determined by a simple localised method, employing preliminary temperature smoothing of the bio-tissue heat. Formulae are presented and results given for the position of the isotherm of the phase transition of the water in the bio-tissue at the time of the cooling process, and for the time-dependent temperature characteristics of different points of the bio-tissue under investigation, as a function of the geometry of the instrument rate of consumption of the cryogenic agent and properties of the bio-tissue. (2 refs.) *Z.F.V.*

69048 **Healthy potential of negative ions.** C.Fairbrother (Fairford Hospital, Fairford, England).
Indian & East. Eng., vol.124, no.10, p.441-2 (Oct. 1982). [received: March 1983]
The author describes developments in medical ionisers from the viewpoint of her specialisation in ophthalmic nursing. (no refs.)

69049 **Installation and testing of a hospital based cyclotron for radiation therapy and isotope production.** P.R.Almond, J.R.Marbach, V.A.Otte (Univ. of Texas System Cancer Center, M.D. Anderson Hospital & Tumor Inst., Houston, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1772-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A hospital based cyclotron is under installation at The University of Texas M.D. Anderson Hospital in Houston. This machine will be used for the production of radioactive isotopes and for the generation of neutrons for the radiotherapy treatment of cancer. It is a Cyclotron Corporation CP-42 negative proton accelerator. For neutron production the protons are transported through an isocentrically mounted beam transport system than can be rotated round the patient. The shielding requirements of this facility are described as are the initial measurements on the characteristics of the neutron beam. (6 refs.)

69050 **A medical cyclotron, facilities and program at the King Faisal Specialist Hospital and Research Centre Riyadh, Saudi Arabia.** R.C.Barrall, K.A.Merendino, N.Feteih (Cancer Therapy Inst., King Faisal Specialist Hospital & Res. Centre, Riyadh, Saudia Arabia).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1777-80 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A new Cancer Therapy Institute at the King Faisal Specialist Hospital and Research Centre in Riyadh, Saudi Arabia became fully operational in November 1982. The new building incorporates extensive facilities for the production of medically useful radionuclides and additional cancer treatment capability including two neutron therapy machines and an electron linear accelerator. (5 refs.)

69051 **The changing role of accelerators in radiation therapy.** W.F.Hanson (Dept. of Phys., M.D. Anderson Hospital & Tumor Inst., Houston, TX, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1781-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Conventional low energy X-rays have been used in radiation therapy since the turn of the century. Van de Graaff and Betatron accelerators changed the complexion of radiation therapy in the mid 1940s by providing significantly deeper penetrating photon beams and also providing therapeutic quality electron beams. The development of Cobalt-60 teletherapy in the mid 1950s suppresed the role of accelerators in radiation therapy for nearly 20 years. However, with the development of reliable isocentric rotating linear accelerators, accelerators are rapidly becoming the most popular conventional therapy devices. Following unfavorable clinical results with fast neutron therapy in the late 1930s and early 1940s, the role of cyclotron produced fast neutrons is presently experiencing a renewal in radiation therapy. Several facilities are also experimenting with heavy charged particle beams for therapy. (15 refs.)

69052 **Radiation therapy treatment: the role of treatment aids and accessories.** D.A.Goer (Varian Associates Inc., Palo Alto, CA, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1784-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The goal of successful Radiotherapy requires that treatment machines deliver a prescribed dose distribution to a prescribed target volume. The use of specially designed treatment aids and accessories can assist the radiotherapist in achieving this goal. This paper describes some of the recent developments in this area and suggests possible areas for future development efforts. (29 refs.)

69053 **Electrical stimulation of the spinal cord: a further analysis relating to anatomical factors and tissue properties.** W.K.Sin, B.Coburn (Dept. of Mech. Engng., Brunel Univ., Uxbridge, England).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.264-9 (May 1983).
The midsagittal plane of the human thorax is represented by a two-dimensional finite-element model. Solutions of steady-state potential fields of bipolar epidural stimulation are computer generated. Effects of biological tissue conductivity and geometry on the fields are studied. Interpretations in terms of current density show that variations of bone conductivity have little influence on the fields. For constant current stimulation, the presence of the tough dura mater, irrespective of its thickness, does not seem to be significant. In contrast, the crucial factor affecting the field is the width of subarachnoid space which contains the highly conductive cerebrospinal fluid. (7 refs.)

69054 **Equipment using an impedance technique for automatic recording of fluid-volume changes during haemodialysis.** B.Tedner (Dept. of Medical Engng., Karolinska Inst., Stockholm, Sweden).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.285-90 (May 1983).
An instrument for continuous monitoring of fluid-volume changes has been developed. A tetrapolar whole-body impedance technique is employed with a constant current of 100 μA at 1.5 kHz and 150 kHz. A microprocessor automatically calculates changes in fluid volume from changes in whole-body impedance. Body-surface area is used as a normalising factor together with an empirically determined constant to obtain readings expressed in litres. Estimates of fluid-volume changes obtained by the method were compared with concomitant changes in the body weight of ten patients undergoing haemodialysis, and a correlation coefficient of 0.89 was found. 69055 **A model to explain the effect of soft lens design specifications on movement.** M.M.Bibby (Ciba Vision Care, Atlanta, GA, USA), A.Tomlinson.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.287-91 (April 1983).
A model is presented which explains the movement of a contact lens in terms of its primary design specifications. The model is supported by clinical evidence. The interrelation between lens thickness, sagittal depth, and diameter is explained. The model explains why fewer base curves are needed as lens thickness is reduced. (9 refs.)

69056 **Validation of a model describing soft lens movement as a function of lens specification.** T.H.Cedarstaff, A.Tomlinson (School of Optometry, Indiana Univ., IN, USA), M.M.Bibby.
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.292-6 (April 1983).
The authors fitted 12 subjects with 30% water-content, soft contact lenses. The saggital depth of the lenses was varied in five steps while diameter was held constant. In a second study, diameter was varied from 12 to 14 mm in five steps. Regression analysis was used to analyze the data. Lens movement can be decreased by increasing lens thickness, reducing lens diameter or flattening the base curve of the lens. (12 refs.)

69057 **Effect of X-Chrom lens wear on chromatic discrimination and stereopsis in color-deficient observers.** E.R.Matsumoto, C.A.Johnson, R.B.Post (Dept. of Ophthalmology, Univ. of California, Davis, Ca, USA).
Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.4, p.297-302 (April 1983).
Four color-deficient observers and one normal trichromatic subject were evaluated with color vision and stereoacuity tests during 1 month of X-Chrom lens wear. For all color tests, performance of the normal subject was unaltered by X-Chrom lens wear. Color-deficient subjects demonstrated improved performance on the Ishihara pseudoisochromatic color plates, but either degraded performance or no change on the Farnsworth-Munsell 100-hue or Pickford-Nicolson red-green anomaloscope test. Three of the five subjects exhibited degraded stereoacuity in conjunction with X-Chrom lens wear. It is concluded that the X-Chrom lens does not improve discrimination in color-deficient subjects and may alter stereopsis. (14 refs.)

69058 **Electrocutaneous code pairs for artificial sensory communication systems.** A.Y.J.Szeto (La Jolla Technol. Inc., San Diego, CA, USA).
Ann. Biomed. Eng. (USA), vol.10, no.4, p.175-92 (1982).
Pairs of electrocutaneous codes suitable for dual-channel sensory communication systems were compared using a dual-channel electrocutaneous tracking task. The tracking task required the test subject to dynamically respond to changes in the tactile sensation being modulated by two independent pseudorandom signals, one for each channel. The rule (or method) by which the signals changed the tactile sensations was called an electrocutaneous code. Four frequency variation codes and two intensity variation codes were paired in different combinations and then checked as to their effectiveness for sensor communications. The experimental protocol used a balanced incomplete block design which involved 24 subjects testing 3 of 8 code pairs each. Although the variance in the tracking performances between subjects was larger than the differences between the code pairs, learning rates for the various pairs were significantly different. The easiest one to learn was the Low Pulse Rate Modulation Code paired with itself. Other findings included the general superiority of monophasic stimulation code pairs over biphasic stimulation code pairs, the need for placement of the two electrodes on different dermatomes in order to achieve satisfactory dual-channel communications, and the greater sensitivity to electrocutaneous stimulation of the ventral side of the forearm versus its dorsal side. (29 refs.)

69059 **Design and fabrication of an experimental cochlear prosthesis.** G.E.Loeb, C.L.Byers, S.J.Rebscher, D.E.Casey, M.M.Fong, R.A.Schindler, R.F.Gray, M.M.Merzenich (Dept. of Otolaryngology, Univ. of California, San Francisco, CA, USA).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.241-54 (May 1983).
The technical and safety requirements for intracochlear electrical stimulation to restore hearing in the profoundly deaf are reviewed. A system has been implanted in human subjects which comprises a 16-contact flexible electrode array, radio receiver/stimulator and surgical disconnect which permits changing from percutaneous cable to transcutaneous telemetry. The design, fabrication, and mechanical and electrical testing of each of the components are discussed in detail. Major improvements over previous systems include controlled introduction of anisotropic flexing properties in the electrode array to

facilitate insertion and optimal contact orientation, enlarged and stabilised contact surface area and the development of a new connector technology which combines high density, high reliability, biocompatibility and ease of operation during surgery. (42 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

69060 Blood platelet aggregometer: predicted effects of aggregation, photometer geometry, and multiple scattering. P.Latimer (Phys. Dept., Auburn Univ., Auburn, AL, USA).
Appl. Opt. (USA), vol.22, no.8, p.1136-43 (15 April 1983).
The in vitro aggregation of blood platelets is usually monitored with a visible light transmittance photometer (aggregometer). These cells in plasma are large ($\alpha=2\pi a/\lambda\simeq16$) soft ($m=1.04$) particles. The factors which significantly influence transmittance include the inherent scattering properties, multiple scattering, and photometer design. Now scattering theory and numerical methods for radiative transfer are used to survey how aggregation should influence transmittance as measured with various photometers. The results should help expand the analytical power of the transmittance photometer as a tool for monitoring aggregation. Evidence is also presented that scattering by aggregates of aerosol particles, which are of a higher relative refractive index, should also be adequately predicted by these approximate methods. (25 refs.)

69061 A device for the electrical measurement of the deformability of red blood cells. H.G.Roggenkamp, F.Jung, H.Kiesewetter (Rheinisch Westfalischen Tech. Hochschule Aachen, Aachen, Germany).
Biomed. Tech. (Germany), vol.28, no.5, p.100-4 (May 1983). In German.
For the measurement of red blood cell deformability a new device is introduced. The passage time of single erythrocytes passing a single pore in a membrane is determined as an index for red blood cell deformability. The total resistance of the measuring chamber is changed during the passage of an erythrocyte. The duration of this alternation of the resistance directly depends on the passage time. This electrical measurement signal is compared to the signal of the hitherto employed optoelectronical registration. (14 refs.)

69062 A programmable multiple-tone generator. J.Polich, A.Fischer, A.Starr (Dept. of Neurology, California Coll. of Medicine, Univ. of California, Irvine, CA, USA).
Behav. Res. Methods & Instrum. (USA), vol.15, no.1, p.39-41 (Feb. 1983).
A simple tone generator that allows software control of auditory stimuli is described. The circuit provides for the simultaneous generation, timing, and amplification of three different tones. Its low cost, ease of construction, and versatility make it an attractive alternative to conventional auditory stimulus hardware. (6 refs.)

69063 A low-cost solid state device for producing delayed auditory feedback. F.L.Yaffe (Washburn Univ., Topeka, KS, USA), L.Bostwick.
Behav. Res. Methods & Instrum. (USA), vol.15, no.1, p.42-4 (Feb. 1983).
Presents a design for construction of a relatively low-cost solid-state delayed auditory feedback device. The advantages of this unit are that it is reliable, flexible, easy to operate, and it does not require audio tape. (12 refs.)

69064 A microprocessor control system and solid state interface for controlling electrophysiological studies of conditioning. P.R.Solomon (Dept. of Psychology, Williams Coll., Williamstown, MA, USA), D.J.Weisz, G.A.Clark, J.Hall, B.A.Babcock.
Behav. Res. Methods & Instrum. (USA), vol.15, no.1, p.57-65 (Feb. 1983).
Describes a microprocessor control system and solid state interface for controlling the apparatus in combined behavioral-electrophysiological studies of conditioning. The computer program, which is designed to control classical conditioning of the rabbit's nictitating membrane response, provides the flexibility to control all conditioning parameters (e.g., interstimulus and intertrial intervals, trial type, and sequence of trial types) with only minor modification. The system is free from artifacts that can distort electrophysiological recordings and can easily be modified to accommodate other behavioral paradigms in which electrophysiological responses are recorded. (10 refs.)

69065 Ferritin as a label for high-gradient magnetic separation. C.S.Owen, J.G.Lindsay (Dept. of Biochem., Jefferson Medical Coll., Philadelphia, PA, USA).
Biophys. J. (USA), vol.42, no.2, p.145-50 (May 1983).
In three model systems, particles the size of cells or smaller have been surface labeled with ferritin to make them slightly paramagnetic, by virtue of the iron in the ferritin. In each case it was possible to show that labeled particles could be magnetically removed from a flowing suspension by the high-gradient magnetic separation (HGMS) technique. The first system of particles consisted of small (1 μm) carboxylate-modified latex spheres to which ferritin was covalently bound to create stable paramagnetic particles analogous to a ferritin-labeled subcellular membrane preparation. In the second system polyacrylamide beads that more closely approximated whole cells in size (5-50 μm) were labelled with immunoferritin. The third system was a biomembrane preparation erythrocyte ghosts labeled with a ferritin-lectin conjugate. A field of 7 T (tesla) (70 kG) was used in each case, along with buffer flow rates through the HGMS column in the range 0.1-1.0 ml/min. (24 refs.)

69066 A theoretical study on the sucrose gap technique as applied to multicellular muscle preparations. III. Methodical errors in the determination of inward currents. E.Lammel (Dept. of Physiology, Marburg, Germany).
Biophys. J. (USA), vol.42, no.2, p.159-70 (May 1983).
For pt.II see ibid., vol.36, p.555-73, 1981. The analysis of errors associated with saline-sucrose interdiffusion in sucrose gap experiments on multicellular muscle preparations described in pt.I and pt.II is extended to the determination of current-voltage relations that contain an activated inward current component. The membrane current-voltage (i_t-V_m) relation used in the computations was N-shaped and consisted of two components, an outward (background) current (i_{bg}) with properties of anomalous (inward-going) membrane rectification, and an inward current (i_s) resembling the slow inward current of cardiac muscle. Reconstruction of current-voltage relations, which simulate those determined experimentally, indicates that in the potential range in which the total membrane current (i_t) is outward, i_t is measured too high, whereas it is measured too low in the range of net inward current. Reversal potentials of the inward and outward components are both shifted to more negative values, that of the inward current being more affected. (35 refs.)

69067 Fluorescence monitoring of electrical responses from small neurons and their processes. A.Grinvald, A.Fine, I.C.Farber, R.Hildesheim (Dept. of Neurobiology, Weizmann Inst. of Sci., Rehovot, Israel).
Biophys. J. (USA), vol.42, no.2, p.195-8 (May 1983).
To improve the sensitivity of fluorescence measurements of electrical rsponses from small cells and their processes, the authors have optimized the optical measuring system. The fluorescence intensity from a stained cell was increased 40-fold relative to the authors' previous apparatus. The increased fluorescence intensity permits the use of an inexpensive photodiode (or a photodiode array) that has a ~10-fold higher quantum efficiency relative to a photomultiplier. Utilizing the improved apparatus, the authors optically recorded an action potential of a 2 μm wide neuronal process with a signal-to-noise ratio of ~50 (root mean square noise) without averaging. They also report the design of an improved fluorescence voltage-sensitive probe; the fractional change of the fluorescence signal under optimal conditions was 21%/100 mV. (15 refs.)

69068 Application of low energy proton beam for determination of elemental composition in healthy and pathological tissues. K.Durek (Acad. of Medicine, Krakow, Poland), L.Jarczyk, J.Oszacki, E.Rokita, A.Strzalkowski, M.Sych, A.Urban.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1310-12 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
In the aim of comparison of normal and pathological tissues two groups of samples were analysed. The first group consisted of gastric mucosa samples. Basing on the histological findings the samples were selected with different cancer cells count varying from very high value to the zero level (normal tissue). The second group of samples composed of blood serum, erythocytes, hairs and muscle tissue taken from patients with gall-bladder or gastric cancer and those with noncancer gastro-intestinal tract disease. Using PIXE method the concentrations of the following elements were determined: P, S, Cl, K, Ca, Ti, Cr, Mn, Fe, Ni, Cu, Zn, Se, Br, Rb, Sr and Pb. The significant differences of the content of various elements in normal and pathological tissue were observed. (4 refs.)

69069 PIXE using cyclotron and lung cancer pathogenesis. G.Weber, G.Robaye, P.Bartsch, A.Collignon, I.Roelandts, J.M.Delbrouck-Habaru (Dept. of Medicine, Univ. of Liege, Liege, Belgium).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1313-15 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The lung lobes of patients with bronchial carcinoma, removed during surgical operation were submitted to analysis of mineral content, by the particle induced X-ray emission (PIXE) method. The content of the tumor itself was measured and compared to the content of surrounding non-cancerous tissue. These results were then opposed to those previously obtained at autopsy from the lungs of patients in the same range of age, deceased of various non-cancerous diseases. The most striking finding was very high values for several elements around the tumour and, among them, the more constantly elevated were chromium, nickel and titanium which may reach tenfold values, compared with the reference group. (6 refs.)

69070 PIXE analysis of human hair samples. K.M.Varier (Dept. of Phys., Univ. of Calicut, Kerala, India), A.K.Nayak, G.K.Mehta.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1316-18 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
PIXE analysis of human hair samples was carried out with 2 MeV protons. The trace elemental contents in hair samples collected from different parts of the same person had standard deviations ranging from 17% to 28% whereas those from hair samples of different persons had standard deviations ranging from 26% to 69%. Significant differences in the trace levels in samples from different parts of the body of the same person suggests that the trace elemental absorption and accmulation in hair depends on the location of the hair in the body. The trace concentrations in white hair and black hair also showed differences. (13 refs.)

69071 Application of PIXE analysis to neurological diseases. R.W.Hurd, H.A.Van Rinsvelt, E.A.Perry, J.W.A.Kondoro, J.M.Andres, J.P.Mickle (Dept. of Neurosci., Univ. of Florida, Gainesville, FL, USA), B.J.Wilder, W.Maenhaut, L.De Reu.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1319-22 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
PIXE analysis was used to determine the elemental status of patients receiving the anticonvulsant valproic acid, patients with Reyes Syndrome, and animals with an experimentally-produced Reyelike disease. A result common to all studies was an alteration in selenium levels. (28 refs.)

69072 A comparison of PIXE and flame atomic spectrometry for hair analysis. E.Clayton (Lucas Heights Res. Lab., Australian Atomic Energy Comm., Sutherland, NSW, Australia), J.F.Chapman, K.K.Wooller.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1323-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The major components of hair have been determined using ion beam techniques. Trace element concentrations measured by PIXE are compared with an analysis on the same forty samples using flame atomic spectrometry. (9 refs.)

69073 Ion beam analysis of scalp hair as a monitor of occupational exposure. E.Clayton (Appl. Phys. Div., Lucas Heights Res. Lab., Australian Atomic Energy Comm., Sutherland, NSW, Australia), K.K.Wooller.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1326-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Proton Induced X-Ray Emission (PIXE) has been used in trace element analysis of human hair. Samples were charred, mixed with graphite spiked with yttrium (as an internal standard) pressed into pellets and bombarded with a 2.5 MeV proton beam. Concentrations of some twenty elements have been determined. The use of the method to monitor for Pb and As exposure as well as some miscellaneous element exposures is discussed. (9 refs.)

69074 The determination of platinum in human tissues with PIXE. T.G.M.H.Dikhoff, J.A.van der Heide, M.Prins (Eindhoven Univ. of Technol., Eindhoven, Netherlands), J.G.McVie.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p,1329-31 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Platinum levels as well as trace element concentrations in samples from cisplatin treated patients have been measured using the PIXE technique. The results were verified by neutron analysis for some elements. Spectral interferences of the platinum Lβ peak and selenium Kα have been solved by introducing a germanium layer as a selective absorber. The experiments are done in the frame work of a project on the assessment of the toxicity of cytostatic

platinum compounds. Preliminary results for liver, kidney and heart tissues are shown. (6 refs.)

69075 Trace element distribution at the subcellular level—possible correlation between zinc and mRNA. Ch.Ender, M.Q.Li, B.Martin, R.Nobiling, B.Povh, D.Reiss, K.Traxel (Max-Planck-Inst. für Kernphys., Heidelberg, Germany).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1332-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The trace element distributions at the subcellular level in a single cell have been analyzed using the Heidelberg scanning proton microprobe (SPM). The tip of growing pollen tube of Lilium longiflorum is characterized by a specific zonation. Through SPM analysis in the tip have obtained the element distributions for P, Ca, and Zn. Experimental results indicate that the trace element Zn is associated with a special zone, containing the smooth endoplasmic reticulum. The mRNA is also enriched in that zone; therefore a possible correlation between Zn and mRNA could exist. (13 refs.)

69076 Multi-element analysis of small biological samples. E.Rokita (Inst. of Phys., Jagellonian Univ., Cracow, Poland), W.Maenhaut, J.Cafmeyer.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1601-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A method combining PIXE and INAA was developed to determine the elemental composition of small biological samples. The method needs virtually no sample preparation and less than 1 mg is sufficient for the analysis. The method was used for determining up to 18 elements in leaves taken from Cracow Herbaceous. The factors which influence the elemental composition of leaves and the possible use of leaves as an environmental pollution indicator are discussed. (7 refs.)

69077 A system for dynamic analysis in biological systems with carbon-11. C.E.Nelson (Depts. of Radiology & Phys., Duke Univ., Durham, NC, USA), Y.Fares, J.D.Goeschl, C.E.Magnuson, C.H.Jaeger, B.R.Strain, E.G.Bilpuch.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1801-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
An integrated approach to the study of effects of environmental factors on plants is described. The system relies on the continuous labelling and measurement of naturally occurring tracer activity as it courses through the plant. These features allow the investigation of the magnitude of the photosynthate distribution, the transport times of photosynthates, and the dynamic response of the distribution to environmental factors. A host of ecologically, agriculturally and genetically important questions can be answered with this technique, including the consequences of increased CO_2 concentration in the atmosphere, and other environmental effects. (6 refs.)

69078 Estimation of effective pulmonary capillary pressure in intact lungs. H.Holloway, M.Perry, J.Downey, J.Parker, A.Taylor (Dept. of Physiology, Coll. of Medicine, Univ. of South Alabama, Mobile, AL, USA).
J. Appl. Physiol. (USA), vol.54, no.3, p.846-51 (March 1983).
A method is described for estimating pulmonary capillary pressure in intact dog lungs. The vascular pressure transients after occlusion of a small pulmonary artery or vein with Swan-Ganz catheters were analyzed for the inflection point between rapid and slow components. This transition point was assumed to represent the beginning of the discharge of blood stored in pulmonary microvessels and defined as the effective capillary pressure. For the arterial pressure decay curves, the fast and slow components had rate constants of 0.77 and 0.25/s, respectively. Comparable inflection point capillary pressures were obtained with either digitized curves displayed in semilogarithmic fashion or direct visual inspection of the recorder chart of the same arterial pressure tracings. The effective capillary pressures obtained using wedge pressure tracings were well correlated with isogravimetric measurements of capillary pressure and should provide a useful method for evaluating the capillary filtration pressure in the lungs of intact animals or patients. (24 refs.)

69079 A procedure for determining angular positional data relative to the principal axes of the human body. P.Gervais (Dept. of Phys. Education, Univ. of Alberta, Edmonton, Alberta, Canada), G.W.Marino.
J. Biomech. (GB), vol.16, no.2, p.109-13 (1983).
Describes a simple computational procedure for determining angular displacement-time histories of human motion from three-dimensional cine data. The method is based on algebraic transformations of coordinates and coordinate axes. Through these coordinate transformations data was acquired for a multi-axial tumbling skill to illustrate angular displacement-time data relative to the moving coordinate system described by the human body through space. (7 refs.)

69080 Arterial tonometry: review and analysis. G.M.Drzewiecki, J.Melbin, A.Noordergraaf (Dept. of Bioengng., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Biomech. (GB), vol.16, no.2, p.141-52 (1983).
A review is presented of the field of arterial tonometry and of the problems involved with its application. A second generation model is developed which interprets most of the difficulties encountered in previous experimental work. The model also identifies barriers that must be overcome to allow tonometry to become a practical technique for obtaining measurement of continuous, absolute blood pressure. Problems addressed include those of calibration, positioning sensitivity, design standardization, material properties and vascular loading characteristics. Theoretical and experimental studies provide support for the application of basic biomechanical concepts for solution of these problems and suggest required design features. (46 refs.)

69081 A constant stress creep testing machine. S.Vogel, M.N.Papanicolaou (Dept. of Zoology, Duke Univ., Durham, NC, USA).
J. Biomech. (GB), vol.16, no.2, p.153-6 (1983).
A device is described which permits loading of highly extensible materials at constant stress while monitoring extension as a function of time. As presented, the device accommodates extensions of up to four times resting length, loads from 0.1 to 10 N, and specimen lengths from 1 to 5 cm. (4 refs.)

69082 Improved filtration method for red cell deformability measurement. Y.Kikuchi, T.Arai, T.Koyama (Div. of Physiology, Res. Inst. of Appl. Electricity, Hokkaido Univ., Sapporo, Japan).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.270-6 (May 1983).
A method which enables reliable measurements of red cell deformability in whole blood to be performed is presented. It is based on the Nuclepore filtration method described by Reid et al. (see J. Clin. Path., vol.29, p.855-8, 1976). Its reliability was much improved, obtaining an accuracy of within 5% by a technique to remove air bubbles trapped in the filter pores, which caused the poor reproducibility observed before. Simple analyses of the flow characteristics of whole blood and the haematocrit dependence of whole blood passage time were given to eliminate the effect of transient pore blockings of white cells and the contribution of different haematocrit in the whole blood passage time. A mean pore passage time of single red cells is obtainable as a quantitative index of red cell deformability. Furthermore, a good utilisation was achieved by making full use of electrically operated valves and aspiration pumps. It is possible to repeat measurements at intervals of 3 min. This improved filtration method will be useful for diagnostic purposes since it can avoid artefacts caused by artificial treatments added on blood samples and time changes after blood sampling. (15 refs.)

69083 Tilt-table/ankle-actuator system for the study of vestibulospinal reflexes. R.E.Kearney, I.W.Hunter, P.L.Weiss, K.Spring (Biomedical Engng. Unit, McGill Univ., Montreal, Quebec, Canada).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.301-5 (May 1983).
The vestibular system is thought to influence human postural control both by means of direct effects on motoneurons and by indirect interactions with somatosensory reflexes. Experimental investigation of vestibulospinal effects therefore requires the independent, dynamic manipulation of both somatosensory and vestibular inputs. The paper describes a system developed to provide this capability for human studies. It consists of a tilt table, whose angle of tilt is controlled by a linear hydraulic actuator, on which is mounted a rotary hydraulic actuator. Subjects are strapped to the table with the left foot connected to the rotary actuator. Both actuators are operated as position servos, allowing vestibular input to be controlled by dynamically varying the table's angle of tilt and somatosensory input to be controlled by manipulating the angular position of the ankle with the rotary actuator. The independent dynamic control of both vestibular and somatosensory inputs afforded by the tilt-table/ankle-actuator device makes possible the application of multiple input/output engineering systems analysis techniques. (25 refs.)

69084 CoSTEL: a computer peripheral remote sensing device for 3-dimensional monitoring of human motion. V.Macellari (Lab. di Ingegneria Biomedica, Istituto Superiore di Sanita, Roma, Italy).
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.311-18 (May 1983).
An automatic system (CoSTEL) which permits the reconstruction of the instantaneous 3-dimensional position of target points (infrared light emitting body markers) in a laboratory frame was designed. The 3-dimensional CoSTEL transducer is based on a suitable spatial arrangement of three one-dimensional transducers. Each transducer is made of a charge-coupled device linear array image sensor lying on the focal plane of a toroidal lens and appropriately aligned with it. The system was conceived for 3-dimensional whole body movement analysis and is able to track eight landmarks per subject side simultaneously. Its basic features are resolution of 1/4000, maximum sampling frequency 1.1 kHz (100 Hz is actually used), large insensitivity to background light and transducer output in digital form. These features provide a high level of accuracy, reliability and working stability. (14 refs.)

69085 Improved Ag/AgCl pressure electrodes. Y.J.Kingma, J.Lenhart, N.G.Durdle (Dept. of Electrical Engng., Univ. of Alberta, Edmonton, Alberta, Canada), K.L.Bowes, M.M.Chambers.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.351-7 (May 1983).
When electrodes are used to measure slowly varying signals such as the slow wave in the gastrointestinal tract (0.01 to 10 Hz) it is necessary that the impedances of the electrodes are low at these frequencies, and the drift must also be low. The authors have carried out a programme of (a) electrode surface pretreatment, (b) electrolytic AgCl deposition, (c) impedance measurements, (d) electrode storage methods and (e) noise and drift measurements. Optimal preplating treatment was found to be roughening of the cleaned Ag surface. The electrode impedance could be lowered by about an order of magnitude using 50 μm Al_2O_3 absrasive powder. Electrodes pretreated as described and optimally plated showed drift voltages of less than 1 μV min^{-1} and noise voltages of less than 1 μV. The low drift allowed the use of d.c. coupling during slow wave measurement on intestinal smooth muscle. The waveform in this case approximated the intracellular one closely. (7 refs.)

69086 An audiometer with automatic frequency selection. P.Bouchet, J.Pernier, P.Gerin (INSERM/CEMI, Bron, France), A.Morgon, A.Ubersfeld.
Med. & Biol. Eng. & Comput. (GB), vol.21, no.3, p.365-70 (May 1983). In French.
An audiometer, orientated towards frequency selection is realised using a microprocessor. The generation of sound signals is effected by a numerical method. Amplitude control of the signals is carried out with a minimum of circuits. The apparatus is self-checking in operation. A method of rapid and automatic research into hearing thresholds is presented. (4 refs.) *H.C.B.*

69087 Alpha-particle autoradiography in CR-39: a technique for quantitative assessment of alpha-emitters in biological tissue. A.P.Fews, D.L.Henshaw (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Phys. Med. & Biol. (GB), vol.28, no.5, p.459-74 (May 1983).
The techniques for α-particle autoradiography based on the plastic nuclear track detector CR-39, previously reported, have been developed considerably. The techniques are applied to α-autoradiography of human lung tissue in particular but are applicable to any biological tissue. The most important developments are: (i) Improvements in the manufacture and pre-etching of the plastic. These allow activities as low as $\sim 10^{-15}$ Ci g^{-1} to be determined. (ii) High resolution α-particle spectroscopy in CR-39 plastic based on the analysis of the structure of the etched track. This enables the energy of individual α-particles to be determined to $\sim$35 keV. (iii) Calculation of the effective thickness of tissue sampled by the plastic. This relates the tissue activity to the track density on the plastic. (iv) A deconvolution analysis which takes the distribution of track length and dip angle in the plastic and determines the α-particle range spectrum and distribution of tissue activity with height above the plastic surface. This enables both the absolute abundance and the microdistribution of α-active nuclides present to be determined. (v) The analysis of radon diffusion in tissue to determine the mean random diffusion distance in tissue and plastic. (15 refs.)

69088 Modeling of the Sino-Atrial node. M.Sameh Said (School of Engng., California State Univ., Fresno, CA, USA), A.A.R.Riad, S.M.Riad, K.Razzaghi.
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.199-203
An electrical model is established to simulate the operation of the SA node. Active networks (activators) are designed which when loaded by passive K and Na channels produce I-V characteristics identical to those of the SA node. Localized activation of SA node requires very little power as compared to pacemakers. (15 refs.)

69089 Automatic relocation of ground control points in Landsat imagery. A.H.Benny (Space Dept., Royal Aircraft Establ., Farnborough, England).
Int. J. Remote Sens. (GB), vol.4, no.2, p.335-42 (April-June 1983).
Images obtained from the Landsat multispectral scanner are not provided in any normally recognised map projection system, so it is often necessary for a transformation to be made. This is usually done with the aid of ground control points, whose locations on the ground (or on a map) are accurately known and which can be accurately located within Landsat images. The initial selection and location of such ground control points is usually performed manually. For repeat imagery the same ground control points can be used. The positions of these points can be relocated within the repeat image either manually or, as described by the author, by an almost entirely automatic computer process. The process is developed for use with images of Britain but it could readily be adapted for worldwide use. (9 refs.)

69090 Spectral analysis of gravity and magnetic anomalies due to a vertical circular cylinder. A.Soto, S.K.Singh, C.Flores (Inst. de Geofisica, Ciudad Univ., Mexico City, Mexico).
Geophysics (USA), vol.48, no.2, p.224-8 (Feb. 1983).
Expressions for the spectra of gravity and magnetic anomalies due to a vertical right circular cylinder are written in terms of a Bessel function and the sum of two expotentials. From the zeros of the amplitude spectra, which are the zeros of the Bessel function, an estimate of the radius of the cylinder is obtained. The depths to the top and to the bottom enter as exponents of the exponential terms and are evaluated by taking ratios of the spectra at several frequencies. The density or the intensity of magnetization is then estimated. For the magnetic case the epicenter of the cylinder is obtained from the slope of the phase spectra. The method is tested on anomalies of various cylinders. (14 refs.)

69091 Rock density from borehole gravity surveys. T.R.LaFehr (EDCON Inc., Denver, CO, USA).
Geophysics (USA), vol.48, no.3, p.341-56 (March 1983).
Describes how borehole gravity meter (BHGM) recordings may be used to determine the density of rocks that do not occur in uniform horizontal strata. In the presence of anomalous masses, significant distortion in formation bulk density is possible. The apparent density anomaly produced in the well by an elongated, offset density contrast is proportional to the angle subtended by the density-change interface. For a density-change boundary having circular symmetry with respect to the well, the apparent density anomaly at the center of the bed is proportional to the sine of the subtended angle. Because the distortion in bulk density is the same above a horizontal boundary as it is just below an abrupt change in apparent density is equal to the real density change at the boundary. This change in density, termed 'the Poisson jump', is independent of geometry. Two methods are suggested for obtaining bulk densities from BHGM apparent densities: (1) by obtaining two stations just outside as well as just within the zone of interest, the Poisson jump can be approximated and added to an independent density source (e.g. the gamma-gamma log), and (2) the apparent density anomaly within the formation of interest can be derived by modeling (perhaps based on seismic or well data) and added to the BHGM-determined densities. (14 refs.)

69092 A least-squares approach to depth determination from gravity data. O.P.Gupta (KDM Inst. of Petroleum Exploration, Dehradun, India).
Geophysics (USA), vol.48, no.3, p.357-60 (March 1983).
Deals with a numerical approach to determine the depth of a buried structure from the residual anomaly. The problem of depth determination has been transformed into the problem of finding a solution of a nonlinear equation of the form $f(z)=0$. Formulas have been derived for a sphere, vertical and horizontal cylinders, and for a vertical fault (thin plate approximation). The procedure is applied to synthetic data with and without random errors. Finally, a field example is presented in which the depth to a fault is estimated at 3.8 km and verified from drilling results. (9 refs.)

69093 Approximate method for direct interpretation of gravity anomalies caused by surface three-dimensional geologic structures. J.Svancara (Geofyzika Brno, Brno, Czechoslovakia).
Geophysics (USA), vol.48, no.3, p.361-6 (March 1983).
An efficient method for direct transformation of gravity anomalies into contour lines of depth is proposed. The method is applicable for surface three-dimensional bodies whose shape may be approximated by a cone at the first step. Hypothetical and field data evaluations presented here prove the efficiency of the method. (5 refs.)

69094 Palaeolatitudes from DSDP Leg 73 sediment cores: implications for the apparent polar wander path for Africa during the late Mesozoic and Cenozoic. L.Tauxe (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA), J.Besse, J.L.LaBrecque.
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.315-24 (May 1983).
Palaeolatitudes estimated from DSDP sediments provide important constraints on the apparent polar wander path (APWP) of Africa during the Cenozoic. A revised APWP is suggested based on new information about palaeomagnetic poles from the African continent and predicted palaeolatitudes are compared with those determined from Leg 73 sediments. Other published paths are discussed. (44 refs.)

69095 Palaeomagnetism of the Proterozoic Zig-Zag Dal Basalt and the Midsommerso dolerites, eastern North Greenland. C.Marcussen, N.Abrahamsen (Lab. of Geophys., Univ. of Arhus, Arhus, Denmark).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.367-87 (May 1983).
Palaeomagnetic investigations are reported from 24 sites in the Proterozoic Zig-Zag Dal Basalt Formation and 12 sites in the Midsommerso dolerites of eastern North Greenland. The Zig-Zag Dal Basalt is a typical tholeiitic flood basalt sequence, and dolerite intrusions in the underlying sandstones are thought to be genetically related to the basalts. After a detailed AF demagnetisation programme 19 sites in the basalts and 10 sites in the dolerites reveal one stable component of magnetisation, probably of TRM and/or CRM origin residing in small single domain titanomagnetite grains. The degree of anisotropy has not affected the direction of the remanent magnetisation. The maximum axis of the anisotropy ellipsoid is parallel to the flow direction of the magma, whereas the minimum axis is perpendicular to the flow plane. (44 refs.)

69096 Atmospheric angular momentum fluctuations, length-of-day changes and polar motion. R.T.H.Barnes, R.Hide, A.A.White, C.A.Wilson (Geophys. Fluid Dynamics Lab., Meteorological Office, Bracknell, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.31-74 (8 May 1983).
The authors re-examine some aspects of the theory of nonrigid body rotational dynamics and angular momentum exchange between the atmosphere and solid Earth. They show that partial integration leads to an expression involving simple functions—the equatorial angular momentum functions—which can be reliably evaluated from available meteorological data. The length-of-day problem is treated in terms of a similar axial angular momentum function, and effective angular momentum functions are defined in order to allow for rotational and surface loading deformations of the Earth. Daily values of these atmospheric angular momentum functions have been calculated, and are presented for the period 1 January 1981-30 April 1982. Finally they demonstrate that meteorological phenomena provide an important contribution to the excitation of polar motion. (37 refs.)

69097 Correlation of changes in gravity, elevation, and strain in southern California. R.C.Jachens, W.Thatcher, C.W.Roberts, R.S.Stein (US Geological Survey, Menlo Park, CA, USA).
Science (USA), vol.219, no.4589, p.1215-17 (11 March 1983).
Measurements made once or twice a year from 1977 through 1982 show large correlated changes in gravity, elevation, and strain in several southern California networks. Precise gravity surveys indicate changes of as much as 25 microgals between surveys 6 months apart. Repeated surveys show that annual elevation changes as large as 100 millimeters occur along baselines 40 to 100 kilometers long. Laser-ranging surveys reveal that coherent changes in areal strain of 1 to 2 parts per million occurred over much of southern California during 1978 and 1979. Although the precision of these measuring systems has been questioned, the rather good agreement among them suggests that the observed changes reflect true crustal deformation. (18 refs.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

69098 Modeling of self-potential anomalies near vertical dikes. D.V.Fitterman (Denver Federal Center, US Geological Survey, Denver, CO, USA).
Geophysics (USA), vol.48, no.2, p.171-80 (Feb. 1983).
The self-potential (SP) Green's function for an outcropping vertical dike is derived from solutions for the DC resistivity problem for the same geometry. The Green's functions are numerically integrated over rectangular source regions on the contacts between the dike and the surrounding material to obtain the SP anomaly. The analysis is valid for thermoelectrical source mechanisms. Two types of anomalies can be produced by this geometry. When the two source planes are polarized in opposite directions. A monopolar anomaly is produced. When the thermoelectric coefficients changes monotonically across the dike, a dipolar anomaly is produced. Field data collected over a hot intrusive fissure are presented which have been modeled by the technique described. (15 refs.)

69099 Electromagnetic soundings in the sedimentary basin of southern Ontario—a case history. E.Gomez-Trevino, R.N.Edwards (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Geophysics (USA), vol.48, no.3, p.311-30 (March 1983).
The results of electrical and electromagnetic (EM) soundings conducted in the sedimentary basin of southern Ontario are presented. The sounding sites are located strategically to take advantage of the dipping nature of the sediments, a progressive study being undertaken from shallow to deep sections. The vertical magnetic field transfer function, estimated with a pseudonoise source EM system, and conventional Schlumberger apparent resistivity are jointly inverted. For each site, the layered Earth model containing the minimum number of layers is fitted to the data. The joint inversion enables up to eight distinct layers to be identified at some sites. The nonuniquenesses or ambiguities in each model are revealed through an eigensolution analysis. The intrinsic ambiguities of the models of the deeper sections are resolved by a systematic, progressive site-to-site correlation of electrical units across the basin. (18 refs.)

69100 DC telluric fields in three dimensions: a refined finite-difference simulation using local integral forms. J.F.Hermance (Dept. of Geological Sci., Brown Univ., Providence, RI, USA).
Geophysics (USA), vol.48, no.3, p.331-40 (March 1983).
A new finite-difference form is developed for simulating the distortion of telluric fields by 3-D azimuthally symmetric structures. The technique involves a sequence of local integrations of the electric current density crossing closed surfaces surrounding each mesh node. The resulting expressions, which are accurate to second degree everywhere, correctly describe first-order discontinuities in the electric field normal to electrical discontinuities in the interior of the model. Moreover, the new form (a nine-point finite-difference operator) accounts for cross-derivative (e.g. $\partial^2U/\partial r\partial z$) effects in the region about each node, which can lead to significantly improved accuracy near sharp, localized discontinuities where the anomalous field decays as $1/R^2$ or $1/R^3$ with distance. Numerical simulations are compared with analytical solutions for two simple models: (1) a circular disk-shaped heterogeneity in a thin-sheet; and (2) a sphere imbedded in a homogeneous, infinite medium. The comparison between the analytical and numerical results for both of these models indicates that an accuracy of better than a few percent is not exceptional. (17 refs.)

69101 Analysis of aeromagnetic measurements from the Cascade Range in central Oregon. G.Connard (Northwest Geophys. Associates Inc., Corvallis, OR, USA), R.Couch, M.Gemperle.
Geophysics (USA), vol.48, no.3, p.376-90 (March 1983).
Aeromagnetic measurements in the central Cascades between 43° and 44° N latitude and 121° and $122^1/_2$° W longitude exhibit predominant northwest-southeast lineations and less prominent north-northeast by south-southeast lineations. Longer wavelength components of the magnetic anomalies possibly related to deeper sources, trend approximately north-south parallel to the Cascade Range. Magnetic anomalies show a right-lateral offset of the High Cascades Volcanism at $43^1/_2$° N latitude. Magnetic source depth calculations show that the High Cascades occupy a structural depression or graben on the eastern side of the Western Cascades. Spectral analysis of the magnetic anomalies suggests that the High Cascades are underlain by Curie-point isotherm depths as shallow as 9 km. These shallow Curie-point isotherm depths imply thermal gradients greater than 50°C/km and surface heat flow greater than 100 $\mathrm{mW/m^2}$. (46 refs.)

69102 The distribution of electric conductivity on the eastern border of the West African craton (Republic of Niger). M.Ritz (Centre ORSTOM, Obs. Geophys., Dakar, Senegal).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.475-88 (May 1983).
Magnetotelluric soundings (MT) were conducted along the 14th parallel on the eastern border of the West African craton in the Republic of Niger. This profile includes eight sites an average of 30 km apart. The author determines the regional structure of electric conductivity and its relation to the various geologic belts covered. This study took place within a 15-500 s period band. Two-dimensional modelling suggests that, in the sites located on the sedimentary basin and the mobile belt, there exists a conductive layer in the upper mantle at a depth of 80 km. Within the craton the author is unable to prove the existence of this conductive layer. There also exists another conductive layer at the crust—upper mantle boundary at a depth of 30 km, but this seems to disappear in the cratonic belt. (23 refs.)

69103 The frequency response of the horizontal magnetic field for a conductive channel. D.Hebert (Dept. of Phys., Univ. of Victoria, Victoria, BC, Canada).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.577-80 (May 1983).
Babour & Mosnier's (1979) results showing no frequency dependence between the anomalous horizontal magnetic field above a conductor and the difference between the horizontal magnetic fields above and below the conductor over a wide range of frequencies led them to conclude that this effect is due to current channelling. A two-dimensional numerical model of a conductive channel, with a uniform horizontal source field, shows the same effect over a wide range of frequencies. Thus local induction can show the same effect. (6 refs.)

69104 Comment on 'A paleomagnetic record from Tangle Lakes, Alaska: large amplitude secular variation at high latitudes' by K.L. Verosub. G.M.Turner (Dept. of Phys., Victoria Univ., Wellington, New Zealand).
Geophys. Res. Lett. (USA), vol.10, no.3, p.185 (March 1983).
For original see ibid., vol.9, no.8, p.823-6 (1982). Verosub (1982) reports unexpectedly large amplitude geomagnetic secular variations from the palaeomagnetic record of a section of core spanning the period 4560 to 2880 yr BP from Tangle Lakes, Alaska, and he infers large scale changes in the dipole or nondipole magnetic field during this period. The author argues that an unexpected result obtained from a single record may not be reliable. The observed variation may have been produced by a twisting of the core tube during the coring procedure, or it may be the result of variations in the palaeomagnetic recording process in the sediments. It is concluded that the reported secular variation requires verification. (7 refs.)

69105 Pre-23 magnetic anomalies between Jan Mayen and Greenland-Senja fracture zones in the Norwegian Sea. T.Hagevang (Saga Petroleum A/S, Hovik, Norway), O.Eldholm, I.Aalstad.
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.345-63 (1983).
Analysis of magnetic data between the Jan Mayen and Senja fracture zones indicates that the anomaly 24A-B sequence extends from the Lofoten Basin onto the outer Voring Plateau. Anomaly patterns, including those on the conjugate margin, suggest that the pre-23 sea floor spreading was characterized by an unstable plate boundary between fracture zones. The pre-23 spreading rate was at least 2.5 $\mathrm{cm\ yr^{-1}}$ which is remarkably high compared with the post-23 rates. An evolutionary model which assumes Cenozoic oceanic crust as far landward as the Voring Plateau and Greenland escarpments is suggested. (34 refs.)

69106 Seamount magnetism in the Ionian Sea, eastern Mediterranean. Z.Ben-Avraham (Israel Oceanographic & Limnological Res. Ltd., Haifa, Israel), C.G.A.Harrison, E.Klein, Y.Shoham.
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.389-404 (1983).
Several seamounts in the Ionian Sea, the largest unit in the eastern Mediterranean, have magnetic anomalies. The magnetization vectors of six of these seamounts have been calculated. These paleomagnetic data suggest that the Ionian Sea is composed of several crustal units which came to their present location from different directions. This implies that there has been relative motion in the past between various land masses around the Ionian Sea. The possibility that the Ionian Sea is composed of several crustal units is supported by observations of the magnetic field over the area which is of different character in the north and south. The major limitation in applying the paleomagnetic data into an evolutionary scheme is that all the seamounts in the Ionian Sea as well as its crust are undated. (33 refs.)

69107 Cross-over analysis of marine magnetic anomalies. J.Verhoef, R.D.Scholten (Vening Meinesz Lab., Univ. of Utrecht, Utrecht, Netherlands).
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.421-35 (1983).
Using cross-over analysis the reduction of total magnetic intensity values to magnetic anomalies was studied in an area with ship-tracks which have been made over a period of several years. Under these circumstances the secular variation becomes important. At first the authors used the old IGRF 1975. This reference field does not correct the secular variation accurately. In the period 1969-1980 the mean values of the differences of the magnetic anomalies at crossings rise to more than 150 nT. The recently adopted reference fields DGRF 1965, DGRF 1970, DGRF 1975 and PGRF 1975 correct the secular variation much better. The mean values now only rise to about 50 nT over the same period. A reduction using a regional determined by filtering along the track removes the secular variation completely. The latter reduction has the disadvantage that the standard deviations of the mean values at the intersections increase, because the regional depends on the orientation of the track line. Calculation of average secular variation in subareas of 4×4 degrees yields a decrease from the northeast to the southwest. (15 refs.)

69108 Geomagnetic induction effects in ground-based systems. L.J.Lanzerotti.
Space Sci. Rev. (Netherlands), vol.34, no.3, p.347-56 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Plasma physics processes, whose ultimate origin is the Sun, exist in the Earth's magnetosphere and ionosphere and can produce effects which are detrimental to the operation of technological systems associated with long conductors deployed on the Earth's surface. Geomagnetic fluctuations produced by such plasma processes can cause disturbances and disruptions in cable communication systems, electrical power distribution systems, and long pipelines. This paper briefly addresses these three topics with illustrative examples of some measured effects from each topic area. (43 refs.)

69109 Magnetotelluric results opposing magma origin of crustal conductors in the Rio Grande rift. G.R.Jiracek, E.P.Gustafson, P.S.Mitchell (Dept. of Geological Sci., San Diego State Univ., San Diego, CA, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.299-326 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Although conductive intracrustal layers appear to be characteristic of continental rift zones, they also have been detected in stable crustal environments. The low-resistivity layers are often explained by free water or crustal magma; however, alternative explanations are possible. Two-dimensional analysis of a portion of 25 new magnetotelluric stations in the central Rio Grande rift supports the presence of a conductive zone at 10 km depth or less. However, very significant differences are apparent in the crustal sections at two close localities. Mid-crustal magma lenses, well-defined by seismic data, cannot explain these differences. Only the possible effects of regional three-dimensional current channeling could conceivably alter this conclusion. To explain the unexpected result, it is suggested that a conductive horizon occurs where an impermeable, ductile cap traps pore fluids beneath. Where active magma injection destroys the integrity of the ductile cap, trapped fluids may escape and produce an overall decrease in conductivity.

69110 Remote sounding of the Earth's resistivity-depth profile. M.El-Raey (Dept. of Phys., Univ. of Alexandria, Alexandria, Egypt).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.981-7 vol.1
The analogy of the inverse problem of underground resistivity sounding by two current electrodes and two colinear potential electrodes to the general remote sensing integral equation of radiative transfer, is demonstrated. Kernels of resistivity sounding have been shown to have maxima at depths determined by interelectrode spacing, as well as by the resistivity profile itself. Chahine's (1972) nonlinear relaxation technique have been suggested to retrieve resistivity profiles to depths determined by maximum current penetration. Optimum interelectrode spacing required to reduce the number of surface measurements have been determined by suitable choice of kernels. A technique is suggested in which a uniform resistivity depth profile is used to calculate initial kernels. Implications are drawn by analogy to the atmospheric sensing problem. (20 refs.)

91.30 SEISMOLOGY

69111 Effect of initial stresses on reflection and transmission of seismic waves at the Earth's core-mantle boundary. A.Chattopadhyay, M.Chakraborty (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).
Arch. Mech. (Poland), vol.34, no.1, p.61-72 (1982).
The influence of initial stresses is shown on the reflection and transmission of *P* and *SV*-waves at the Earth's core-mantle boundary. The initial stresses have been taken as compressive and hydrostatic in nature. Results have been shown by graphs and tables for some particular values of initial stresses and compared with the classical results. It is concluded that initial stresses have significant effects on the reflection and transmission coefficients, and on the energy partition and critical angles of total reflection and transmission. (8 refs.)

69112 Effects of irregularity on the propagation of guided SH-waves. A.Chattopadhyay, M.Chakraborty, A.K.Pal (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India).
J. Mec. Theor. & Appl. (France), vol.2, no.2, p.215-25 (1983).
The aim is to study the propagation of guided SH-waves in an internal stratum with an irregularity of the interface. A homogeneous and isotropic internal stratum is considered with a parabolic irregularity in the lower interface, lying between two semi-infinite homogeneous and isotropic elastic half-spaces. The dispersion curves for different sizes of irregularity have been drawn for the fundamental mode and are compared with that for the medium without any irregularity. It has been observed that the presence of irregularity in the interface has the effect of lowering the phase velocity of the waves particularly in the low period range. (16 refs.)

69113 The influence of out-of-plane surface properties on unmigrated time sections. J.K.Cohen, N.Bleistin (Dept. of Math., Univ. of Denver, Denver, CO, USA).
Geophysics (USA), vol.48, no.2, p.125-32 (Feb. 1983).
Both analytic and numerical means are used to demonstrate amplitude and phase behaviour of reflections from three-dimensionality curved interfaces. In particular, the high-frequency geometrical optics approximation for the backward scattered wave field demonstrates that the phase of a reflection from a syncline is determined by the (in general, different) positions of focal regions for the two principal curves at the specular reflection point. Thus the amplitudes and phases of events observed on seismic sections are influenced as much by the shape of the reflector 'out-of-the-plane', as by the shape of the plane of the section. Results of the numerical examples suggest possible pitfalls in traditional interpretation of two-dimensional seismic data. (3 refs.)

69114 Attenuation and anisotropy of channel waves in coal seams. D.J.Buchanan, P.J.Jackson, R.Davis (Mining Res. & Dev. Establ., Nat. Coal Board, Burton-on-Trent, England).
Geophysics (USA), vol.48, no.2, p.133-47 (Feb. 1983).
In recent years channel-wave seismology has shown itself to be a useful aid to coal mining. The useful range of the method in a particular seam depends critically on the rate at which channel waves in the frequency range of interest (50 to 500 Hz) are attenuated during passage through the coal; when no faulting is located by a given survey, it is always important to know at what range a fault would have been detected had it been present. To this end, the attenuation and the anisotropy of the group velocity are discussed. (31 refs.)

69115 Seismic reflections from a gas-water contact. N.C.Dutta, H.Ode (Shell Dev. Co., Bellaire Res. Center, Houston, TX, USA).
Geophysics (USA), vol.48, no.2, p.148-62 (Feb. 1983).
Using the Biot theory, the authors perform calculations to show that viscous fluid flow affects seismic wave amplitudes and reflection coefficients as a gas-water boundary in a porous sand reservoir. The formulation of the boundary value problem for fluid-filled porous rocks is applicable at all angles and follows parallel to the classical reflection and transmission problem solved by Knott, Zoeppritz, and others for two elastic mediain perfect contact. It is pointed out that there are two major differences between the two: (1) in the present case, the authors deal with the propagation of inhomogeneous waves, and (2) there are interference fluxes of energy between various types of waves. The latter exists only at an oblique incidence. (20 refs.)

69116 Inverse scattering for a layered acoustic medium using the first-order equations of motion. M.S.Howard (Exploration Res. Div., Conoco Inc., Ponca City, OK, USA).
Geophysics (USA), vol.48, no.2, p.163-80 (Feb. 1983).
The inverse scattering problem for a layered acoustic medium is considered from the first-order differential equations of motion, resulting in a vector formulation of the problem, and using a vector form of the Schrodinger inverse scattering methods. The result is a vector Marchenko equation. The solution for plane waves at normal incidence is given along with a good approximate solution which is easily obtainable and takes into account transmission losses not included in the normal WKBJ-Born approximation. A new solution for extracting separately the velocity and density of the medium using the reflection response for two different angles of incidence is given. (15 refs.)

69117 Normal incidence layered system state-space models which include absorption effects. F.Aminzadeh (Univ. of Southern California, Los Angeles, CA, USA), J.M.Mendel.
Geophysics (USA), vol.48, no.3, p.259-71 (March 1983).
It is shown how to include absorption effects in a normal incidence state-space model of a layered media system. Two models are discussed: a convolutional state-space model and a differential-delay state-space model. Extensive results are presented for the former model, whereas only formulative results are presented for the latter. For the convolutional state-space model the authors develop absorption impulse responses in closed form for Gaussian and exponential absorption operators. Simulation results demonstrate that this model has the desired low-pass filtering effect expected of a system with absorption losses. The differential-delay state-space model does not appear to have been applied before in the context of seismic modelling. The authors suggest it as a useful model. (20 refs.)

69118 Applications of operator separation in reflection seismology. D.L.Brown (Dept. of Geophys., Stanford Univ., Stanford, CA, USA).
Geophysics (USA), vol.48, no.3, p.288-94 (March 1983).
The principle of operator separation, a generalization of operator splitting, is applied to some problems in reflection seismology. In particular, the examples of wave-equation migration of seismic data in a three-dimensional medium and accurate depth migration in a laterally varying medium are considered in light of this theory. For the case of a stratified three-dimensional medium, the standard dimensional splitting technique used in the downward-continuation step of the migration process can be replaced with full dimensional separation. The computational implications of this result are that the wave field array need only be transposed once during the downward continuation rather than 2*n* times, where *n* is the number of finite-difference steps taken in the calculation. (9 refs.)

69119 Lattice filtering applications to deconvolution of seismic data. J.C.Robinson (Cities Service Co., Energy Resources Group, Tulsa, OK, USA).
Geophysics (USA), vol.48, no.3, p.295-310 (March 1983).
Lattice digital filtering techniques have only recently been exposed to any significant extent through the technical literature, primarily in articles not directly related to reflection seismology. The most basic 'all-zero' lattice filter dates back only around a decade. This paper first reviews current technology in adaptive lattice filtering from the standpoint of seismic deconvolution. An 'all-pole' deconvolution technique is developed next; then a new 'pole-zero' lattice is adapted to seismic deconvolution, and operational methodologies for its effective implementation and stabilization are developed. Some advantages of deconvolution by lattice filtering and other potential applications of lattice filters to seismic data processing are suggested. The adaptive abilities and effectiveness of seismic deconvolution by the three lattice types are tested and compared with stationary Wiener deconvolution. (24 refs.)

69120 Frequency dependence of the quality factor in the upper crust: a deep seismic sounding approach. F.Thouvenot (Lab. de Geophys. Interne, IRIGM, Grenoble, France).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.427-47 (May 1983).
Ray amplitudes are computed in a one-dimensional velocity structure where the quality factor *Q* varies continuously with depth. An iterative process is then proposed to derive the quality factor distribution in the upper crust from deep sounding data. Results for compressional waves in the French Massif Central and for a signal frequency close to 20 Hz show that *Q* increases in a rather linear way from about 40 in surface up to 600 at 7 km depth. *Q* seems to be higher in the Central Alps: 180 in surface, 1600 at 5 km depth (at 20 Hz). Using proper signal processing, the frequency dependence of *Q* is investigated in the frequency range 10-25 Hz. (25 refs.)

69121 Bilateral propagation of a spontaneous two-dimensional anti-plane shear crack under the influence of cohesion. A.K.Chatterjee, L.Knopoff (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.449-73 (May 1983).
Considers the problem of the bilateral extension of a two-dimensional anti-plane shear crack that initiates spontaneously at a point and extends under the influence of cohesive forces at the edges. An approximation to the stresses in the regions beyond the edges of the crack has been found that simplifies the calculation. The exact stresses in these regions are also found iteratively. It is found that if healing is initiated due to the encounter of one end of a uniformly propagating crack with an unbreakable barrier, the static stress drop in the torn region is constant but may either overshoot or undershoot the dynamical stress drop. In these cases, the final static slip distribution is obtained by freezing the dynamic solution along a characteristic line through the location of the barrier. (24 refs.)

69122 Complex distribution of large thrust and normal fault earthquakes in the Chilean subduction zone. M.Malgrange, R.Madariaga (Dept. Sci. Phys. de la Terre, Univ. Paris VII, Paris, France).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.489-505 (May 1983).
Presents the results of a systematic study of events with $M_s > 6$ in northern Chile (20-33°S), for the period between 1963 and 1971. Medium to large earthquakes near the coast of this region are of three types: (1) Interplate events at the interface between the downgoing slab and the overriding South American plate. (2) Intra-plate earthquakes 20-30 km inside the downgoing slab. They have fault mechanisms indicating extension along the dip of the slab. (3) Less frequent events that occur near the top of the downgoing slab and have thrust mechanisms with an almost horizontal E-W compressional axis. Three groups of events near 32.5°, 25.5° and 21°S were studied in detail. Depth and mechanisms were redetermined by *P*-wave modelling and relative locations were obtained by a master event technique. (27 refs.)

69123 Short review and recent results on microseisms. P.Bernard (Inst. de Phys. du Globe de Paris, Paris, France).
Geophys. Surv. (Netherlands), vol.5, no.4, p.395-407 (Feb. 1983).
This paper endeavours, mostly in a bibliographical manner, to show the place of meteorological microseisms among the whole of geophysics. Relations with swell are mentioned with their theoretical and practical consequences for the properties of both phenomena, and the work of members of the International Commissions on Microseisms is summarized, covering velocity and bearing of the waves, spectral analysis, relation with atmospheric circulation, and world-wide extension of these researches since the IGY. In a recent project, undecennial variation of yearly means of microseismic disturbance, the maximum of which often occurs 2-3 years after sunspot maxima, is investigated using data from several stations. Changes in the solar constant are suggested as the physical influence responsible, and new recording devices are proposed to follow on an absolute scale the future behaviour of such an index of atmospheric disturbances. (64 refs.)

69124 Reply to M. Berberian's comment on the paper, A. Mohajer-Ashjai and A.A. Nowroozi 'The Tabas earthquakes of September 16, 1978 in east central Iran', G.R.L. No. 9L0391. A.Mohajer-Ashjai (Atomic Energy Organization of Iran, Tehran, Iran), A.A.Nowroozi.
Geophys. Res. Lett. (USA), vol.10, no.3, p.199-202 (March 1983).
For original see ibid., vol.9, no.3, p.193-4 (1982). The Tabas earthquake of September 16, 1978, M=7.7, has been associated with extensive thrust faulting; there has been some confusion about the fault-length associated with this earthquake. At least 70 km of fresh surface faulting is associated with this earthquake together with several branches of secondary faulting. (15 refs.)

69125 Three dimensional velocity image of a barrier associated with a moderate Pyrenean earthquake. J.R.Grasso (Lab. de Geophys. Interne, IRIGM, Grenoble, France).
Geophys. Res. Lett. (USA), vol.10, no.3, p.229-32 (March 1983).
The prominent role of barriers is now well recognized in both the initialization and the extension of the earthquake rupture. The mapping of barriers is therefore important in understanding the physical processes by which earth-

quakes occur. The author inverts 800 P wave travel times from an aftershock sequence following a moderate earthquake ($m_b=5.1$) in the Pyrenean area (France) using a stochastic inverse technique to derive a three-dimensional velocity image of the structure. Two scales of imagery were carried out. Both scales reveal the presence of a high velocity contrast (+8%) at the eastern limit of the aftershock zone. This velocity anomaly corresponds to a geometric discontinuity in the trace of the major fault and can be mapped down to a depth of 8 km. (15 refs.)

69126 Crustal structure beneath Spain from deep seismic sounding experiments. E.Banda (Inst. of Geophys., ETH, Zurich, Switzerland), A.Udias, St.Mueller, J.Mezcua, M.Boloix, J.Gallart, A.Aparicio.
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.277-80 (April 1983).
Major tectonic units of Spain have been investigated by deep seismic sounding experiments since 1974 to determine crustal structures and to delineate their differences. These areas are the central part of the Hercynian Meseta, and the Alpine chains: the Betic Cordillera in the south, including the Balearic promontory and the Alboran Sea, and the Pyrenees in the north. The main features of the crust and the upper mantle along a NNE-SSW cross-section from the Pyrenees to the Alboran Sea are described. The crust under the Meseta is typical of Hercynian areas found elsewhere in Europe, with an average thickness of 31 km, whereas the two Alpine regions are characterized by very large lateral inhomogeneities, such as rapid thickening of the crust to 50 and 40 km under the Pyrenees and the Betics, respectively. The deep-reaching E-W-trending North Pyrenean fault has a throw of 10-15 km at the base of the crust. A P_n velocity of 8.1 km s^{-1} is found under the entire Iberian Peninsula. (17 refs.)

69127 Inhomogeneous structure of the Voronezh shield lithosphere from explosion seismology data. A.P.Tarkov, I.V.Basula (Geological Dept., Voronezh State Univ., Voronezh, USSR).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.281-92 (April 1983).
Presents the results of a seismological investigation of the Voronezh shield. The use of industrial quarry blasts and telemetric arrays of the Taiga type for deep seismic sounding observations has enabled the Geophysical Research Group of the Voronezh State University to obtain complete and valid information concerning the deep structure of the shield. Seismic records of refracted and reflected P and S phases from the intracrustal and subcrustal discontinuities allowthe determination of independent and compatible velocity models $V_P(Z)$ and $V_S(Z)$. Analysis of the travel-time and amplitude curves derived from the deep seismic sounding data reveals a complex and inhomogeneous structure of the Voronezh shield lithosphere. The major discontinuities are found in the middle part of the consolidated crust. Several rather thick layers can be resolved, which are separated by first-order seismic boundaries. (23 refs.)

69128 Deep seismic reflection waves and structure of the crust from Dangxung to Yadong on the Xizang Plateau (Tibet). Teng Ji-Wen, Sun Ke-Zhong, Xiong Shao-Bai, Yin Zhou-Xun, Yao Hung, Chen Li-Fang (Inst. of Geophys., Acad. Sinica, China).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.293-306 (April 1983).
The travel times, velocities and spectral distributions of reflected waves generated by underwater explosions in lakes on the Xizang Plateau are studied. The crustal structure on both sides of the Yarlung Zangbo River has been estimated by the inverse solution known as damped least squares. The depth of the Moho is 70-73 km in the region north of the Yarlung Zangbo River; the depth of the Moho in the southern region is 68-45 km. There is a low-velocity (~5.47 km s^{-1}) layer in the crust, and the crustal thickness decreases from north to south in the Xizang Plateau. (14 refs.)

69129 Crustal structure beneath the eastern part of the Coast Ranges (Diablo Range) of central California from explosion seismic and near earthquake data. P.Blumling, C.Prodehl (Geophys. Inst., Univ. Karlsruhe, Karlsruhe, Germany).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.313-26 (April 1983).
Seismic refraction and near earthquake data of the US Geological Survey for central California have been compiled into record sections along profiles and interpreted in terms of crustal structure. The profiles are located northeast of the San Andreas fault of central California and run parallel to the general structures. For the explosion seismic line through the centre of the Diablo Range, an uppermost layer (Franciscan formation) with P velocities of 3.6-5.0 km s^{-1} decreases in thickness towards the northwest. The lower boundaries of layers with constant velocities of 5.75 and 6.8 km s^{-1} are found at almost constant depths of 12 and 21 km, respectively. Between 21 and 26 km depth a well-defined low-velocity zone appears. This zone is underlain by a layer 3-5 km thick with a velocity of 7.6 km s^{-1}. The upper-mantle velocity beneath the Moho at 29-30 km depth is 8.2 km s^{-1}. The velocity-depth distribution derived for the earthquake data is very similar to that found beneath the Diablo Range. (31 refs.)

69130 A crustal seismic reflection—refraction experiment across the subducted Pacific plate under Wellington, New Zealand. F.J.Davey, E.G.C.Smith (Geophys. Div., DSIR, Wellington, New Zealand).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.327-33 (April 1983).
A strong seismic reflector occurs at a depth of ~20 km beneath Wellington. It has been suggested that this reflector may coincide with the interface between the lithosphere of the Indian plate and the underlying lithosphere of the Pacific plate which is currently being subducted at the Hikurangi Trough in the east and dips under North Island, New Zealand, to the west. It would be useful to define this interface from the Hikurangi Trough to the Marlborough Sounds where seismicity data indicate that the subducted plate bends down sharply. The measurements reported here were made along a profile ~50 km long from Palliser Bay to Cook Strait at a point just south of Makara on the west coast of southern North Island. (5 refs.)

69131 Modeling short-period crustal phases (P, Lg) for long-range refraction profiles. K.H.Olsen (Earth & Space Sci. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), L.W.Braile, J.N.Stewart.
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.334-47 (April 1983).
The short-period seismic phases known as $\bar{P}$ and Lg are often recorded at distances of 200-1000 km on long-range refraction profiles. P and Lg propagate as multiply reflected compressional and shear waves in a crustal waveguide whose principal boundaries are the Moho and the free surface. Equivalently, they can be interpreted as the interference pattern produced by a superposition of higher-mode P, SV and SH waves propagating in a leaky waveguide. For compressional waves, the waveguide efficiency is a strong function of frequency and depends on the presence or absence of low-velocity layers within a few kilometers of the surface. Such low-velocity surface layers create constructive interference effects for upcoming P waves incident at near grazing angles at the free surface and lead to efficient $\bar{P}$ propagation. Several good examples of strong $\bar{P}$ phases can be found on long-range refraction profiles for the tectonically active western United States: the 550 km profile eastward from SHOAL to Delta, UT, is analyzed in this article. A modified reflectivity-method computer program is used to model crustal phases for the SHOAL-Delta profile. (16 refs.)

69132 Longshot experiments to study velocity anisotropy in the oceanic lithosphere of the northwestern Pacific. H.Shimamura (Geophys. Inst., Hokkaido Univ., Sapporo, Japan), T.Asada, K.Suyehiro, T.Yamada, H.Inatani.
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.348-62 (April 1983).
Several long-range explosion seismology experiments have been conducted in the northwestern Pacific basin, where one of the oldest oceanic lithospheres is postulated to exist. The lengths of the profiles ranged from 1000 to 1800 km, and the directions were chosen to provide wide azimuthal coverage. One of the aims of this series of experiments was to test the existence of velocity anisotropy on a large, regional scale. The results show that the oceanic lithosphere has anisotropy wherein the velocity changes by 4-7%. The anisotropy extends from a depth of at least 40 to 140 km beneath the sea bottom; however, the magnitude of the anisotropy may vary with depth. The azimuth of the maximum velocity is 150-160° clockwise from north, and coincides with the 'fossil' direction of spreading of the Pacific plate. The azimuth does not seem to depend on depth. The lithosphere is basically two-layered. (14 refs.)

69133 Studies of the continental crust by near-vertical reflection methods: a review. R.Meissner, E.Luschen, E.R.Fluh (Inst. fur Geophys., Univ. Kiel, Kiel, Germany).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.363-76 (April 1983).
The development of near-vertical reflection methods for investigating the continental crust is strongly related to progress that has been made in seismic prospecting and in wide-angle observation in crustal refraction studies. Owing to the good structural resolution of near-vertical reflection methods, many details concerning first-order interfaces in the upper and lower crust have been established. The authors describe the upper and lower crust structural features that have been observed by these methods. (63 refs.)

69134 The use of seismic reflection profiles to probe the crystalline basement in Britain. D.J.Blundell (Chelsea Coll., Univ. of London, London, England).
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.377-81 (April 1983).
In an attempt to assess the feasibility of a future programme of seismic reflection profiling to investigate major structural features deep within the crust of Britain, existing commercial offshore data across shallow basement have been investigated together with lines on land, fired conventionally with explosives, in which record lengths have been extended to at least 12 s two-way time. Profiles crossing Lewisian basement, a granite batholith, and Caledonian and Variscan structures have been examined. The seismic information has been combined with gravity and magnetic surveys, bore-hole logs and surface geology to give self-consistent interpretational models. Features such as instrusive bodies and thrust faults can be discerned within the basement. These are clearly visible on the seismic record section obtained along the MOIST line, fired along the north coast of Scotland especially for deep reflections, and, for the first time, normal-incidence reflections from the Moho are clearly observed. (7 refs.)

69135 Earthquake dating: an application of carbon-14 atom counting. A.B.Tucker (Phys. Dept., San Jose State Univ., San Jose, CA, USA), W.Woefli, G.Bonani, M.Suter.
Science (USA), vol.219, no.4590, p.1320-1 (18 March 1983).
Milligram-sized specimens of detrital charcoal from soil layers associated with prehistoric earthquakes on the Wasatch fault in Utah have been dated by direct atom counting of carbon-14 with a tandem Van de Graaff accelerator. The measured ratios of carbon-14 to carbon-12 correspond to ages of 7800, 8800, and 9000 years with uncertainties of ±600 years. (7 refs.)

69136 I.S.C. mislocation of earthquakes in Iran and geometrical residuals. I.Asudeh (Dept. of Earth Sci., Univ. of Cambridge, Cambridge, England).
Tectonophysics (Netherlands), vol.95, no.1-2, p.61-74 (1983).
P-wave arrival-time data from earthquakes in the Zagros Fold Belt area of western Iran, recorded at as many as 20 local stations temporarily in operation during September 1976, are used to find errors in epicentre locations issued by the International Seismological Centre (ISC). Assuming that Zagros earthquakes are generally confined to the crust (Jackson and Fitch 1981), it was possible to obtain accurate epicentres for these earthquakes. It is shown that when inaccurate velocity models are used in earthquake locations, the geometry of the network of stations used induces a new type of travel-time residuals, called 'geometrical residuals' here, which will disappear if the velocity models are corrected. The geometrical residuals contain information about the correct velocity structure and appear in the routine epicentre locations issued by the ISC.

69137 Potential earthquake risk estimations by application of a simulation process. A.Shapira (Seismological Div., Inst. for Petroleum Res. & Geophys., Holon, Israel).
Tectonophysics (Netherlands), vol.95, no.1-2, p.75-89 (1983).
Potential earthquake risks are defined in terms of the annual probability of exceeding a peak ground acceleration level at the free surface of a site. Potential earthquake risks in Israel were estimated by Shapira (1981, 1982), by considering the apparent seismicity of the region during the last 145 years. A simulation process is applied in order to examine the reliability of previous estimations and to provide another general tool for earthquake risk evaluation. A relatively simple Monte-Carlo procedure was developed and is used for estimating, as an example, the potential earthquake risk in Jerusalem (Israel). The estimated probabilities obtained by the simulation procedure are, for all practical purposes, similar to the apparent probabilities previously determined by the author.

69138 A comparison of the estimate earthquake probabilities in the northeast Indian region. H.C.Goswami, S.K.Sarmah (Dept. of Environmental Sci., Gauhati Univ., Gauhati, India).
Tectonophysics (Netherlands), vol.95, no.1-2, p.91-9 (1983).
The probabilities of occurrence of different magnitude earthquakes are computed using conventional recurrence relation applying completeness test, Gumbel's Type I and Type III distributions of extreme values, and Tanh-fit theory to the available earthquake data for the northeast Indian region. Although there are differences in the results of the estimated return periods of different magnitudes by different methods, the study tends to indicate that the magnitude of the most probable largest annual earthquake is close to 6 and that the same for a 50 year period is 8 or greater.

91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

69139 **Genesis of the Batinah melange above the Semail ophiolite, Oman.** A.H.F.Robertson (Grant Inst. of Geology, Edinburgh, Scotland), N.H.Woodcock.
J. Struct. Geol. (GB), vol.5, no.1, p.1-17 (1983).
The Batinah melange which overlies the late Cretaceous Semail ophiolite in the northern Oman Mountains comprises mostly sedimentary rocks of deep-water facies, alkalic lavas and intrusives, all of continental margin affinities, together with smaller volumes of Semail ophiolitic and metamorphic rocks. The detailed geology of this area is descributed in detail. The rock fracture and deformation features are also described. The authors argue that, during later Cretaceous emplacement over the Arabian margin, active fault corridors split the Semail slab and acted as conduits up which sub-ophiolite rocks were supplied to the ophiolite surface. There the rocks were redistribed by superficial processes. (26 refs.)

69140 **Strain and shape-fabric variations associated with ductile shear zones.** C.Simpson (Dept. of Geological Sci., Brown Univ., Providence, RI, USA).
J. Struct. Geol. (GB), vol.5, no.1, p.61-72 (1983).
The foliated and compositionally-bended granitic orthogneisses in the central core of the Maggia Nappe, a Lower Pennine basement nappe of the Central Swiss Alps, are shown to be the sheared equivalent of late-Hercynian age granitic intrusions. These ductile shear zones show mineral assemblages in amphibolite facies, are Alpine in age and form an anastomosing network enclosing remnant lozenge-shaped pods of relatively undeformed rock. The foliation developed within the shear zones concomitantly with a change in shape of quartz grain aggregates from initially equidimensional, through 'tear-drop' shapes, to ribbon-like aggregates. These shape changes occurred by intracrystalline glide together with intercrystalline slip on deformation-induced planar surfaces. (48 refs.)

69141 **Development of early composite cleavage in pelites from West Donegal.** A.W.Meneilly (Natural Environment Res. Council, Cambridge, England).
J. Struct. Geol. (GB), vol.5, no.1, p.83-97 (1983).
In the Portnoo-Rosbeg area of west Donegal the main penetrative cleavage, S_2, generally dips to the south with F_2 folds facing up to the north. In places the S_2 cleavage is cut by a gently SW-dipping crenulation cleavage (S_3) verging and facing south on the long limbs of F_2 folds. A series of structural domains have been mapped in which the relationship of s_2 and S_3 changes from cross-cutting at a large angle (Rosbeg domain) to the development of a composite $S_{2/3}$ cleavage (Portnoo domain). The relationship between the two phases and the composite cleavage was investigated by mapping out cleavages (megascopic scale), detailed mesoscopic field observations and on a microscopic scale using textural relationships to widespread post D_2-pre D_3 garnet porphyroblasts. (23 refs.)

69142 **An explanation for contradictory geodetic strain and fault plane solution data in western North America.** M.L.Sbar (Dept. of Geosci., Univ. of Arizona, Tucson, AZ, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.177-80 (March 1983).
In a few areas of western North America the principal strain azimuths from geodetic strain measurements differ dramatically from the principal stress directions inferred from fault plane solutions of earthquakes. The reason for this difference may be related to the amount of strain measured by each technique. The strain relieved in an earthquake is about two orders of magnitude greater than that observed by geodetic measurements taken over approximately a seven year time span. Strain measurements may thus sense short-term fluctuations in strain, while earthquakes may average these short-term fluctuations responding to the total strain accumulated to produce a more reliable measure of the longer-term tectonic strain. (15 refs.)

69143 **Continental lithospheric thickness and deglaciation induced true polar wander.** W.R.Peltier, P.Wu (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).
Geophys. Res. Lett. (USA), vol.10, no.3, p.181-4 (March 1983).
The secular drift of the Earth's rotation pole, which is evident in ILS data, is a memory of the planet of the last deglaciation event of the current ice age. In order to fit the observed rate and direction of drift with an Earth model whose viscosity profile is capable of reconciling the free air gravity and relative sea level data of postglacial rebound, requires a lithospheric thickness which is substantially in excess of that which might be considered an appropriate average thickness for the entire planet. This required thickness, which is greater than 250 km, is nevertheless in accord with independent estimates of the thickness of the continental lithosphere. (23 refs.)

69144 **Can 'pure-path' models explain free oscillation data?.** H.Kawakatsu (Dept. of Geophys., Stanford Univ., Stanford, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.186-9 (March 1983).
Several recently published regionalized models of the Earth's lateral heterogeneity obtained by 'pure-path' analysis are compared to free oscillation data of Masters et al. (1982). Among these models, Okal's (1977) model shows a strongly dominant pattern of angular order $l=2$ heterogeneity that is strikingly similar to Masters et al.'s data. This suggests that Okal's model may explain the free oscillation data as well as the 'transition-zone' model of Masters et al., and that shallow lateral heterogeneity may be responsible for the simple pattern of Masters et al. The apparent success of Okal's model suggests the importance of lateral heterogeneity within oceanic regions. The instability of 'pure-path' analysis is also demonstrated by spectral analysis of the lateral heterogeneities of different 'pure-path' models. (12 refs.)

69145 **Alteration of basaltic glass: mechanisms and significance for the oceanic crust-seawater budget.** H.Staudigel (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA), S.R.Hart.
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.337-50 (March 1983).
The authors study the geochemical process whereby glass is altered to palagonite by the action of seawater. The authors describe microprobe analyses of the glass and its alteration products. Trace element and Sr isotope measurements were also made. Since the geochemical fluxes during the alteration are high, the authors also evaluated the abundances of the most important secondary phases acting as sinks for elements liberated during glass alteration. (60 refs.)

69146 **Fixation of radionuclides in the ^{238}U decay series in the vicinity of mineralized zones. I. The Austatom Uranium Prospect, Northern Territory, Australia.** P.J.Shirvington (AAEC Res. Establ., Lucas Heights, NSW, Australia).
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.403-12 (March 1983).
The minimum age of a zone of secondary mineralization, located at the Austatom Prospect in the Alligator Rivers region of Australia, is estimated to be 3.6×10^5 y. This is derived from a geochronological model based on retarded leaching of ^{234}U with respect to ^{238}U and on ratios within the ore of these members of the ^{238}U decay series. Although kaolinite is a dominant mineral in the weathered schist-host-rocks, retarded dissolution of ^{234}U occurs only in the presence of the clay minerals illite and montmorillonite. In their absence the reverse occurs. A model is proposed to explain the results. Ratios of ^{230}Th to ^{238}U indicate that the mineralization has probably remained stationary within the weathered schist for at least 1 to 20×10^5 y. Future use of clay minerals as buffers in radioactive waste repositories is supported by the excellent long-term retention obtained for oxidized uranium. (33 refs.)

69147 **A method of calculating quartz solubilities in aqueous sodium chloride solutions.** R.O.Fournier (US Geological Survey, Menlo Park, CA, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.579-86 (March 1983).
The aqueous silica species that form when quartz dissolves in water or saline solutions are hydrated. Therefore, the amount of quartz that will dissolve at a given temperature is influenced by the prevailing activity of water. Using a standard state in which there are 1000 g of water (55.51 moles) per 1000 cm^3 of solution allows activity of water in a NaCl solution at high temperature to be closely approximated by the effective density of water, ρ_e, in that solution, i.e. the product of the density of the NaCl solution times the weight fraction of water in the solution, corrected for the amount of water strongly bound to aqueous silica and Na^+ as water of hydration. Generally, the hydration of water correction is negligible. The solubility of quartz in pure water is well known over a large temperature-pressure range. An empirical formula expresses that solubility in terms of temperature and density of water and thus takes care of activity coefficient and pressure-effect terms. Solubilities of quartz in NaCl solutions can be calculated by using that equation and substituting ρ_e for the density of pure water. Calculated and experimentally determined quartz solubilities in NaCl solutions show excellent agreement when the experiments were carried out in non-reactive platinum, gold, or gold plus titanium containers. (42 refs.)

69148 **Calculation of amorphous silica solubilities at 25° to 300°C and apparent cation hydration numbers in aqueous salt solutions using the concept of effective density of water.** R.O.Fournier, W.L.Marshall (US Geological Survey, Menlo Park, CA, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.587-96 (March 1983).
The solubility of amorphous silica in aqueous salt solutions at 25° to 300°C can be calculated using information on its solubility in pure water and a model in which the activity of water in the salt solution is defined to equal the effective density, ρ_e, of 'free' water in that solution. At temperatures of 100°C and above, ρ_e closely equals the product of the density of the solution times the weight fraction of water in the solution. At 25°C, a correction parameter must be applied to ρ_e that incorporates a term called the apparent cation hydration number, h. Because of the many assumptions and other uncertainties involved in determining values of h, by the model used here, the reported numbers are not necessarily real hydration numbers even though they do agree with some published values determined by activity and diffusion methods. Whether or not h is a real hydration number, it would appear to be useful in its inclusion within a more extensive activity coefficient term that describes the departure of silica solubilities in concentrated salt solutions from expected behavior according to the model presented here. Both NaCl and Na_2SO_4 solutions are studied. (34 refs.)

69149 The role of CO_2 in the chemical modification of deep continental crust. W.E.Glassley (Dept. of Geology, Middlebury Coll., Middlebury, VT, USA).
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.597-616 (March 1983).
Compositional differences between granulite facies rocks and equivalent amphibolite facies rocks and the observation of CO_2-rich fluid inclusions in granulites, have led to the suggestion that CO_2 must play a role in modifying the composition of deep continental crust. How CO_2 effects this change has remained unclear. Using the thermodynamic properties of aqueous ions in a fluid of evolving CO_2/H_2O ratio, it is possible to model the incongruent dissolution of feldspars under conditions appropriate for granulite facies metamorphism. The results demonstrate that dissolution will be strongly enhanced at high CO_2/H_2O ratios, with ion solubilities being $Na^+ > K^+ \gg Ca^{++}$. This enhancement is compatible with the reported composition contrasts between granulite and amphibolite facies rock, but requires large fluid volumes. To test the dissolution model, a detailed field and petrologic study was conducted in a well exposed granulite facies terrane in West Greenland. Strong correlation between fluid composition and bulk rock chemistry can be documented. (87 refs.)

69150 Elemental composition of two cumulate rocks. A.Naeem (Dept. of Phys., King Saud Univ., Riyadh, Saudi Arabia), A.A.Almohandis.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1604-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Two cumulate rock samples K-185, K-250 from the Kapalagulu intrusion, W Tanzania, were analyzed using X-ray fluorescence (XRF), wet chemical and neutron activation analysis (NAA) techniques. Major element oxides were determined by XRF and wet chemical methods, while the concentration of trace elements were measured by NAA, using high resolution Ge(Li) detector, mini-computer-based data acquisition system and an off-line computer. The percentage of major oxides and sixteen trace elements are reported. It is found that Cr, Ni, and Co are highly concentrated in K-250 while Sc, and most of the major elements are more concentrated in K-185. The variation of major and trace elements in these two samples are discussed. (6 refs.)

69151 Origin of Hawaiian tholeiite and alkalic basalt. C.-Y.Chen, F.A.Frey (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).
Nature (GB), vol.302, no.5911, p.785-9 (28 April 1983).
Haleakala Volcano consists of a tholeiitic basalt shield overlain by alkalic lavas. As a function of decreasing age, La/Ce, Ba/La, Nb/La, Rb/Sr and $^{143}Nd.^{144}Nd$ increase but Sm/Nd and $^{87}Sr/^{86}Sr$ decrease. Inverse correlations between these isotopic ratios and their respective parent/daughter abundance ratios are consistent with mixing of melts derived from an enriched mantle composition with melts formed by <1% melting of a mid-ocean ridge basalt source. (44 refs.)

69152 Combined Sr-O isotope relationships and petrogensis of Andean volcanics of South America. B.Deruelle (Dept. of Earth Sci., Univ. of Yaounde, Yaounde, Cameroun), R.S.Harmon, S.Moorbath.
Nature (GB), vol.302, no.5911, p.814-16 (28 April 1983).
Presents the first combined Sr- and O-isotope study of the southern volcanic zone in Chile (crustal thickness <40 km) and of the southern part of the central volcanic zone (CVZ) in the borderlands of Bolivia, Chile and Argentina (crustal thickness ~60-70 km). Only one of 13 volcanic centres studied (Lascar) exhibits a correlated increase in both ^{87}Sr and ^{18}O parallel with the basalt-andesite-rhyolite compositional change, indicative of contamination by upper crust through a fractional crystallization-assimilation mechanism. The other centres of the CVZ, for which there is an overall Sr-O correlation, document the variable contamination of mantle-derived magmas at depth in the lower crust which had been thickened by Mesozoic and earlier plutonism. (22 refs.)

69153 Crustal structure of the northern Mississippi Embayment and a comparison with other continental rift zones. W.D.Mooney, M.C.Andrews, A.Ginzburg, D.A.Peters, R.M.Hamilton (US Geological Survey, Menlo Park, CA, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.327-48 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Previous geological and geophysical investigations have suggested that the Mississippi Embayment is the site of a Late Precambrian continental rift that was reactivated in the Mesozoic. New information on the deep structure of the northern Mississippi Embayment, gained through an extensive seismic refraction survey, supports a rifting hypothesis. The data indicate that the crust of the Mississippi Embayment may be characterized by six primary layers. The presence and configuration of a low-velocity layer provides evidence for rifting in the Mississippi Embayment. The confirmation and delineation of a 7.3 km/s layer, identified in previous studies, implies that the lower crust has been altered by injection of mantle material. The results indicate that this layer reaches a maximum thickness in the north-central Embayment and thins gradually to the southeast and northwest, and more rapidly to the southwest along the axis of the graben. The apparent doming of the 7.3 km/s layer in the north-central Embayment suggests that rifting may be the result of a triple junction located in the Reelfoot Basin area. The crustal structure of the Mississippi Embayment is compared to other continental rifts.

69154 Crustal structure of rifted continental margins: geological constraints from the Proterozoic rocks of the Canadian Shield. R.M.Easton (Dept. of Earth Sci., Memorial Univ., St. John's, Canada).
Tectonophysics (Netherlands), vol.94, no.1-4, p.371-90 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Rifts associated with possible Proterozoic continental margins and embryonic ocean basins are characterized by an association of tholeiitic volcanics that have chemical characteristics of MORBs, flysch-like sedimentary rocks and extensive gabbro sill swarms comagmatitic with the volcanic rocks. These rifts are similar in stratigraphy and crustal structure to modern rifts such as the Gulf of California. The similarity of these Proterozoic rifts to modern rifts indicate that the process(es) of rifting on the Earth may have been persistent for the past 2.0 Ga. A variety of other Proterozoic rifts are also present in the Canadian Shield, and workers in the Precambrian must examine each rift on an individual basis in order to determine the tectonic setting of the rift being studied.

69155 A numerical model of coupled subcontinental and oceanic convection. U.Christensen (Inst. fur Meteorologie und Geophys., Univ. Frankfurt, Frankfurt, Germany).
Tectonophysics (Netherlands), vol.95, no.1-2, p.1-23 (1983).
At least two different types of convection should exist in the Earth's mantle: a large scale flow which is revealed by the creation and subduction of oceanic crust, and a circulation of unknown scale under the continents, which does not approach the surface. The effects of these coexisting and interacting modes on mantle dynamics and thermal regime are investigated by means of a finite element model system of two adjacent cells which are coupled thermally and mechanically at their interface. An a-priori viscosity distribution is applied in such a way that the surface layer of the longer cell can move with almost uniform velocity, while it is immobile on the shorter cell.

91.40 VOLCANOLOGY

69156 On the intermittency and crystallisation mechanisms of sub-seafloor magma chambers. C.R.B.Lister (School of Oceanography, Univ. of Washington, Seattle, WA, USA).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.351-65 (May 1983).
The conventional view of a magma chamber being an essentially permanent feature of a fast-spreading ridge is not compatible with the physics of either oceanic crustal structure or internal magma convection. There is clear-cut thermal evidence that magma chambers at spreading centres can only be present intermittently. Yet the pervasiveness of cumulate gabbroic outcrops in ophiolite suites show that the chambers, when present, are of considerable lateral extent. The problem now is to discover how a ridge-crest can make room for a large magma chamber in a time short enough for it to develop without being crystallised before it can form. (33 refs.)

91.45 PHYSICS OF PLATE TECTONICS

69157 Analysis of faulting in porous sandstones. A.Aydin (Dept. of Geosci., Purdue Univ., West Lafayette, IN, USA), A.M.Johnson.
J. Struct. Geol. (GB), vol.5, no.1, p.19-31 (1983).
Faults in porous sandstones occur in three forms: deformation bands about 1 mm thick and tens of m long and across which offsets are a few mm; zones of deformation bands constituted of many closely spaced deformation bands across which offsets are a few cm or dm; and slip surfaces, that is, distinct surfaces within zones of deformation bands across which offsets are a few m to a few tens of m. Deformation bands represent highly localized deformation; analogous localization within a field of homogeneous deformation is theoretically possible in elastic materials with certain ranges of constitutive parameters. Crushing and consolidation of sandstone within a band cause the material there to become stiffer than the surrounding porous sandstone. A zone of deformation bands behaves mesoscopically much as stiff inclusion in a soft matrix. According to the constitutive model assumed to investigate the formation of deformation bands, an instability can develop, and strain increments within the zone of deformation bands can become boundlessly large when the far-field stresses reach critical values. This instability is here associated with the formation of slip surfaces. (28 refs.)

69158 Displacement features associated with fault zones: a comparison between observed examples and experimental models. J.F.Gamond (Equipe de Recherches, CNRS, Grenoble, France).
J. Struct. Geol. (GB), vol.5, no.1, p.33-45 (1983).
Fault zones commonly consist of discontinuous surfaces or are composed of different kinds of en echelon fractures (tension cracks, R or P-type fractures) which give the brittle shear zone a width. Translation along these faults and related features can occur by sliding on the elementary planes and/or by solution/deposition processes with opening of transtension zones and possible dilation of the shear zone. In order to understand how fault planes develop and to investigate the mechanical conditions corresponding to natural configurations, displacement along an analogue fault model was examined under conditions of direct shear. The experimental fracture patterns were then compared with the natural features. The structural elements of certain faults created by testing, and showing transpresssion and transtension zones, were found to be similar to natural domino structures bounded by elementary shears, and could be compared with computed situations. (22 refs.)

69159 Interpretation of fracture and physiographic patterns in Alberta, Canada. A.E.Scheidegger (Abteilung fur Geophys., Tech. Univ. of Vienna, Vienna, Austria).
J. Struct. Geol. (GB), vol.5, no.1, p.53-9 (1983).
Thousands of linear elements (joint traces, river trends and photolinears) have been identified and statistically analysed in the Province of Alberta, Canada, from the US border to the Fort McMurray area. A statistical evaluation was performed on the data by fitting Dimroth-Watson distributions to groups of them. It is suggested that the joints represent shear surfaces formed in a neotectonic stress field whose maximum compression is oriented normal to the front of the Rocky Mountains, at least in the vicinity of that range. Further to the northeast, the stress trajectories swing to E-W and N-S directions. The photolineaments are features of uncertain origin and age. (12 refs.)

69160 Large-scale gravity profiles across subducted plates. M.Rabinowicz, B.Lago, M.Souriau (CNES/GRGS, Toulouse, France).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.325-49 (May 1983).
The mean gravity profiles, across Central and South America and Eurasia, in the direction normal to the subduction zone are deduced from the Gem 10B gravity model. They have a typical shape: a maximum close to the trench, a negative slope towards the interior of the plate over a 3000 km wide distance, usually followed by a local maximum. It is found that large convective cells driven by the heat sink of the sinking slab have an associated gravity signal having such a typical shape. A detailed comparison between observed and theoretical data supports this point of view and thus constrains the possible structure of the convective flow under these plates. (42 refs.)

69161 Palaeomagnetic data about southern Tibet (Xizang). I. The Cretaceous formations of the Lhasa block. M.Westphal (Inst. de Phys. du Globe de Strasbourg, Strasbourg, France), J.-P.Pozzi, Yao Xiu Zhou, Li Shen Xing, Xian Yao Chen.
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.507-21 (May 1983).
A palaeomagnetic study of Middle to Late Cretaceous redbeds from Linzhou basin (Lhasa block), north of the Yarlung Zangbo suture zone, gives a stable palaeomagnetic direction of magnetisation with a positive fold-test: six sites, 57 samples, $D=333°$, $I=38°$, $k=78$, $\alpha_{95}=8°$, pole 64°N, 348°E. The authors discuss the problem of a possible remagnetisation but consider that this direction of magnetisation gives a good approximation for the palaeolatitude of the Lhasa block during Middle to Late Cretaceous times. Results from more recent Tibetan formations are also presented. An interpretation is proposed whereby the Lhasa block, which was a part of Asia in the Early Cretaceous, has undergone first a southward motion accompanied by an anticlockwise rotation and then, after the Palaeocene, a northward motion under the constraint of the colliding India. (16 refs.)

69162 Correction to: A thin viscous sheet model for continental deformation. P.England (Dept. of Geological Sci., Harvard Univ., Cambridge, MA, USA), D.McKenzie.
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.523-32 (May 1983).
The governing equation derived by England & McKenzie (1982) for the deformation of a thin viscous shell contains an error. The authors give the correct derivation and correct those figures where the change makes a visible difference. The correct results differ quantitatively from those of England & McKenzie but their conclusions are not affected. (1 ref.)

69163 Test of tectonic models by great circle Rayleigh waves. A.Souriau, M.Souriau (Centre Nat. d'Etudes Spatiales, Toulouse, France).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.533-51 (May 1983).
A large set of published great circle Rayleigh wave phase velocities in the period range 125-350 s is used to compare three recent tectonic models (Okal, 1977; Leveque, 1979, 1980; Jordan, 1978, 1981). Prior to any regionalisation, the symmetry property of the great circle integrals is used to obtain a lower limit of the signal/noise ratio in the data. A standard regression method is applied for computing the 'pure path' velocities and the model efficiency is derived from a variance analysis. The three models have nearly the same efficiency for explaining the short-period data ($T\sim125$ s). Between 200 and 300 s, the higher performance of Okal's model indicates that it is important to separate the subduction zones from the other orogenic zones. The anomalous ellipticity values deduced directly from great circle data are partly explained by a coupling between tectonics and ellipticity. (30 refs.)

69164 Tectonic evolution of the southwest Indian Ocean since the mid-Cretaceous: plate motions and stability of the pole of Antarctica/Africa for at least 80 Myr. R.L.Fisher (Scripps Instn. of Oceanography, Univ. of California, San Diego, CA, USA), J.G.Sclater.
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.553-76 (May 1983).
Presents a detailed topographic chart of the ridge and bordering region between 35°E and 55°E, in addition to a compilation of all the published magnetic anomalies in the same area and also magnetic data recorded in 1978 by R/V Melville of the Scripps Institution of Oceanography on Leg 8 of Expedition Indomed. These data are supplemented by recent unpublished Atlantis II magnetic lines. Bathymetry and magnetic patterns are used with the relocated earthquake epicentres to determine the tectonic elements of the Southwest Indian Ridge between 35°E and 55°E. Older magnetic lineations either side of the ridge axis are identified south of Madagascar and north of Crozet. A history of the Southwest Indian Ocean from the Late Cretaceous (anomaly 34, 80 Ma) to the present is developed. An estimate of the reconstructed position of the African, Antarctic and Indian continents suggests possible positions in the original configuration of Gondwanaland. (36 refs.)

69165 Fragmentation and assembly of the continents, mid-Carboniferous to present. E.Irving (Pacific Geosci. Centre, Sidney, BC, Canada).
Geophys. Surv. (Netherlands), vol.5, no.4, p.299-333 (Feb. 1983).
Eighteen maps showing the motions of the major continents following the break-up of Wegener's Pangaea in the Early to Mid-Jurassic are presented. Palaeolatitudes are determined palaeomagnetically, palaeolongitudes mainly from sea-floor spreading evidence. The break-up commences with the opening of the southern North Atlantic in the mid-Jurassic and its extension north and south in the Cretaceous and Cenozoic. Concurrently the northern continents move northwards away from the southern continents (Gondwana) and a continuous east-west seaway is formed between them in the Cretaceous. Successive fragmentation of continents then created the Arctic, Indian and Antarctic Oceans. Five maps showing the disposition of land in the Permian are also given. The Permian maps show Gondwana situated further east than in the Pangaea configuration of Wegener. There are severe problems in constructing palaeogeographical maps for the Triassic and none are presented. (79 refs.)

69166 Guyots of the Dutton Ridge at the Bonon/Mariana Trench juncture as shown by multi-beam surveys. N.C.Smoot (NSTL Station, US Naval Oceanographic Office, Bay St. Louis, MS, USA).
J. Geol. (USA), vol.91, no.2, p.211-20 (March 1983).
Very accurate bathymetric data for five guyots from the newly named Dutton Ridge are presented along with that of two associated nearby guyots. These new data are based on US Naval Oceanographic Office swath mapping by the SASS multi-beam sonar system (Glenn 1970). The Dutton Ridge is a

major east-west trending feature that intersects the junction of the Bonin and Mariana Trenches. Its trend parallels that of the Michelson Ridge, which lies further to the North at the intersection of the Izu and Bonin trenches. The author suggests that the Dutton Ridge formed as a volcanic plateau at the extinct triple junction of the Phoenix, Farallon, and Pacific Plates. This once-continuous plateau was then fractured and faulted to produce the present group of guyots and ridges. Later volcanism may have altered its morphology. Subsequently, the ridge passively rode along on the Pacific Plate to its present location where it may be jamming the trench juncture, as indicated by a lack of seismic activity at that spot. (26 refs.)

69167 Geodynamics and seismicity of the Pamir-Himalayas region. B.S.Volvovsky (Soviet Geophys. Committee, Moscow, USSR), I.S.Volvovsky, N.Sh.Kambarov.
Phys. Earth & Planet. Inter. (Netherlands), vol.31, no.4, p.307-12 (April 1983).
Deep seismic sounding studies allow an important peculiarity of the deep structure of the Pamir-Himalayas region to be established: the thickness of the Earth's crust is almost twice as large here as on the stable plates. The absence of any evidence for doubling of crustal thickness provides grounds for rejecting the hypothesis of subduction of the rigid Hindustan plate under the geosynclinal folded constructions of the Punjab syntaxis of the Himalayas. Several faults reflect the dynamics and conditions of formation of deep layers of the lithosphere. The Fore Himalayan and Major Himalayan faults are the boundaries between different structural facial zones. The band of greatest thickness of crust extends within the zone of greatest thickness of the asthenospheric layer; a deep minimum in the Bouguer anomalies (−550 mGal) corresponds to this zone. Seismicity of the lithosphere of the Pamir-Himalayas region is caused by geodynamic processes manifested in the higher lithospheric layers by block displacements of the Earth's crust (mostly uplifts), and in the lower parts by shifts of the steeply inclined mantle blocks (the Pamir-Hindukush seismic focal zone). (5 refs.)

69168 Dating of movements along thrusts and faults in the Himalaya. H.S.Saini (Birbal Sahni Inst. of Palaeobotany, Lucknow, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.539-44 (Nov. 1982). [received: April 1983]
Radiometric dating of movements along the MCT (Vaikrita Thrust), two local but deep seated thrusts and the Sumdoh Fault Zone bordering the Kinnar Kailas Granite in the Baspa and Satluj valleys, NE Himachal Himalaya, has been attempted for the first time by fission track method. Garnet and apatite fission track ages suggest the age of the latest phase of movements around 14 and 7 m.y. respectively along the MCT and Sumdoh Fault. The vertical uplift rate along them were 1.1 mm/year from 14 to 7 m.y. and 0.6 mm/year from 7 m.y. to recent geologic past respectively, as against the value 0.036 mm/year during the period from 210 to 17 m.y. in the undisturbed area. (11 refs.)

69169 Quaternary geology and neotectonics of the West flank of the northern Sangre de Cristo Mountains, south-central Colorado. J.McCalpin (Dept. of Geology, Utah State Univ., Logan, UT, USA).
Q. Colorado Sch. Mines (USA), vol.77, no.3, p.V-XIII, 1-97 (July 1982). [received: April 1983]
The Quaternary history of these mountains was dominated by four or five episodes of glaciation. Alluvial fans, moraines and glacial outwash features were studied. The Quaternary faulting of the Sangre de Cristo Fault Zone and Villa Grove Fault Zone in the San Luis Valley is described. The magnitude of Quaternary earthquakes is estimated from observations of the fault displacements. The Quaternary earthquake occurrence is compared to the lack of present day seismicity. (107 refs.)

69170 Mechanism of graben formation—the wedge subsidence hypothesis. M.H.P.Bott, D.P.Mithen (Dept. of Geological Sci., Univ. of Durham, Durham, England).
Tectonophysics (Netherlands), vol.94, no.1-4, p.11-22 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Isostatic subsidence of a downward narrowing wedge of the brittle upper crust bounded by normal faults is shown to provide a viable mechanism of graben formation. Energy balance calculations indicate that the mechanism depends on the occurrence of substantial deviatoric tension, but it requires a much smaller extension than the lithospheric stretching hypothesis. For the mechanism to be effective, a relatively high geothermal gradient is required to allow ductile flow of the lower crust, and the friction on the faults must be much less than that appropriate to dry rock. The amount of subsidence also depends on the narrowness of the graben, the strength of the tensile stress field in the upper crust, and sediment loading. Preliminary finite element analysis is carried out to model the subsidence process. It is suggested that the tension causing the majority of the present day rift systems is produced by the topographical loading and isostatic body forces related to the associated uparching.

69171 Rifts and swells: geophysical constraints on causality. S.T.Crough (Dept. of Geosci., Purdue Univ., West Lafayette, IN, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.23-37 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Analyses are developed to examine whether rifting can generate broad topographic swells and whether swells formed by lithospheric thinning can generate rifts. Although swells can be supported by deep lithospheric cracks filled with low-density intrusions, observed topography and gravity constrain how this might occur. Single deep dikes apparently cannot explain the width of swells, the low-gravity gradients on swell flanks, or the lack of a large negative free-air anomaly over swell crests. If swells are supported by deep cracks, there must be numerous narrow dikes distributed over the full breadth of each swell. Comparing the hydrostatic pressure of various columns of lithosphere to that of an ocean ridge crest suggests the conditions under which a swell might spread apart.

69172 Mechanisms of active and passive rifting. D.L.Turcotte, S.H.Emerman (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.39-50 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Obtains two solutions relating to the alternative active and passive hypotheses for continental rifting. Active rifting assumes the impingement of a mantle plume on the base of the continental lithosphere. The authors determine the rate of lithosphere thinning due to this impingement and conclude that it takes 50-75 million years to thin the continental lithosphere to the base of the crust; the long length of time required appears to rule out this lithospheric erosion mechanism as a viable mechanism for complete lithospheric thinning. The authors suggest that diapiric penetration is the mechanism by which hot mantle rock reaches the base of the continental crust of a rift and have obtained values for the tensional stresses generated by the diapiric penetration of hot asthenospheric rock into the lithosphere. The stress levels are obtained as functions of lithospheric and crustal thinning factors.

69173 Mechanisms of uplift preceding rifting. J.-C.Mareschal (School of Geophys. Sci., Georgia Inst. of Technol., Atlanta, GA, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.51-66 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
The feasibility of three mechanisms, that have been proposed to account for the uplifts and heat flow anomalies which might precede rifting, is examined. The conductive heating, following an increase in the heat flux at the base of the lithosphere, could result in large scale uplifts on a time scale of 10^8 years. A pulse of additional heat flow could induce a more rapid uplift but not the surface heat flow anomaly which is always delayed. The advection of heat by magma intrusion into the lithosphere could also produce the uplift and heat flow anomaly. The complete replacement of the lithosphere by the rise of a diapir of lighter and hotter asthenospheric material modelled numerically. The model indicates that the rise of the asthenospheric diapir can take place in a very short time and produce the surface uplift and the crustal thinning observed in rift systems.

69174 Convective thinning of the lithosphere: a mechanism for rifting and mid-plate volcanism on Earth, Venus, and Mars. T.Spohn, G.Schubert (Inst. fur Meteorologie und Geophys., J.W. Goethe Univ., Frankfurt, Germany).
Tectonophysics (Netherlands), vol.94, no.1-4, p.67-90 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Thinning of the Earth's lithosphere by heat advected to its base is a possible mechanism for continental rifting and continental and oceanic mid-plate volcanism. It might also account for continental rifting-like processes and volcanism on Venus and Mars. The Earth's continental lithosphere can be thinned to the crust in a few tens of million years by heat advected at a rate of 5-10 times the normal basal heat flux. This much heat is easily carried to the lithosphere by mantle plumes. The continent is not required to rest over the mantle hot spot but may move at tens of millimeters per year. For large increases in asthenospheric heat flow, the lithosphere is almost thinned to the crust before any significant change in surface heat flow occurs. The oceanic lithosphere can be thinned to the crust in less than 10 million years if the heat advection is at a rate around five or more times the basal heat flow into 100 Ma old lithosphere.

69175 Mechanical aspects of continental rifting. H.J.Neugebauer (Inst. fur Geophys., Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).
Tectonophysics (Netherlands), vol.94, no.1-4, p.91-108 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Continental rifting is associated with characteristic processes such as crustal extension and vertical movements observed on the surface, and deep-seated phenomena such as lithospheric thinning and upwelling of mantle material. These characteristics are expressed in a variety of geophysical anomalies; increased heat flow, low long wavelength Bouguer gravity with relative gravity high along the rift, delayed body-wave travel times, as well as by volcanic activity with various depth of magma source. The author discusses the concepts of rifting by either lateral or vertical transmission of mechanical energy on the basis of several quantitative numerical models. Mantle diapir models are discussed in detail with reference to the initiation and diapir phases of development, and the induced stress regime. The initiation and development of elongated mantle diapirs is the only concept that explains the majority of phenomena associated with continental rifting.

69176 Submarine rifting at mid-ocean ridges. G.T.Jarvis (Dept. of Geology, Univ. of Toronto, Toronto, Ontario, Canada).
Tectonophysics (Netherlands), vol.94, no.1-4, p.109-22 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
An analytical model for the formation of mid-ocean ridges is presented in which the central rift zone is interpreted as a belt of localized extension of width $2W$ centred on the ridge axis. Upwelling of the asthenosphere occurs passively below the zone of extension at the rate required to conserve mass. At distances greater than W from the ridge axis the lithospheric plates move at a uniform horizontal velocity u_0. The model is thermally and mechanically consistent and predicts the surface heat flow and topography across the rift zone plus the vertical thermal structure and the thickness of the lithosphere below the zone of extension. Measurements of ridge heat flow and topography can be used to constrain estimates of the width of the zone of intrusion.

69177 Hotspot tracks and the early rifting of the Atlantic. W.J.Morgan (Dept. of Geological & Geophys. Sci., Princeton Univ., Princeton, NJ, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.123-9 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Many hotspot tracks appear to become the locus of later rifting, as though the heat of the hotspot weakens the lithosphere and tens of millions of years later the continents are split along these weakened lines. A modern day analog of a possible future rift is the Snake River Plain, where the North American continent is being 'pre-weakened' by the Yellowstone hotspot track. This conclusion is based on reconstructions of the motions of the continents over hotspots for the past 200 million years. The relative motions of the plates are determined from magnetic anomaly isochrons in the oceans and the motion of one plate is chosen ad hoc to best fit the motions of the plates over the hotspots. However, once the motion of this one plate is chosen, the motions of all the other plates are prescribed by the relative motion constraints. In addition to the correlation between the predicted tracks and sites of later continental breakup, exposed continental shields correlate with the tracks.

69178 Mechanism of subsidence of ancient cratonic rift basins. R.F.DeRito (Dept. of Geological Sci., State Univ. of New York, Amherst, NY, USA), F.A.Cozzarelli, D.S.Hodge.
Tectonophysics (Netherlands), vol.94, no.1-4, p.141-68 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Cratonic basins commonly occur over ancient rift zones. These inactive rift basins are recognizable by a positive linear Bouguer gravity anomaly that may correspond to the axial gravity high found in modern rift valleys. Many of these basins undergo discrete periods of increased subsidence rates, or reactivations, long after the mass excess responsible for the linear gravity high was emplaced. Furthermore, the reactivation of many cratonic basins occurs simultaneously with large-scale compressional tectonics. It is suggested that the driving force for subsidence is the isostatically uncompensated ancient mass excess. The subsidence of these basins is modelled by a lithospheric flexure model with a nonlinear Maxwell viscoelastic rheology. Solutions to this model indicate that basins may experience a low subsidence rate throughout geologic time. The subsidence of a basin will stop only when isostatic compensation of the mass excess is achieved. Reactivation by a world-wide increase in heat flow is suggested as a possible mechanism for the synchroneity of basin subsidence throughout a continent.

69179 Phenomena of pulsation tectonics related to the breakup of the eastern North American continental margin. R.E.Sheridan (Dept. of Geology, Univ. of Delaware, Newark, DE, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.169-85 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
New data from the recent IPOD drilling of DSDP Site 534 in the Blake-Bahama Basin give a definite age for the spreading-center shift involved in the breakup of the North American Atlantic margin. A basal Callovian age (~155 m.y.) is determined for the Blake Spur magnetic anomaly marking this spreading-center shift that signals the birth of the modern North Atlantic Ocean. An implication of this age for the Blake Spur event is that very high spreading rates are now required for the Jurassic outer magnetic quiet zone along the North American margin. This association of a relatively high spreading rate with a magnetic quiet zone implies a link between the processes controlling plate spreading, which are in the upper mantle, and the processes controlling the magnetic field, which are in the outer core. A theory of pulsation tectonics involving the cyclic eruption of plumes of hot mantle material from the lowermost mantle could explain the correlation. Plumes carry heat away from the core-mantle boundary and later reach the asthenosphere and lithosphere to induce faster spreading. Rifting of passive margins may be controlled by the more fundamental global processes described by the theory of pulsation tectonics.

69180 Gravity study of the Central African Rift System: a model of continental disruption. I. The Ngaoundere and Abu Gabra rifts. S.E.Browne, J.D.Fairhead (Dept. of Earth Sci., Univ. of Leeds, Leeds, England).
Tectonophysics (Netherlands), vol.94, no.1-4, p.187-203 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
A regional compilation of published and unpublished gravity data for Central Africa is presented and reveals the presence of a major rift system, the Central African Rift System. It is proposed that the junction area between the Ngaoundere and Abu Gabra rift arms in Western Sudan forms an incipient intraplate, triple-junction with the as yet unfractured, but domally uplifted and volcanically active, Darfur swell. It is only the Darfur swell that shows any similarities to the uplift and rift history of East Africa. The other two rifts arms are considered to be structurally similar to the early stages of passive margin development and thus reflect more closely the initial processes of continental fragmentation than the structures associated with rifting in East Africa.

69181 Gravity study of the Central African Rift System: a model of continental disruption. II. The Darfur domal uplift and associated Cainozoic volcanism. P.M.Bermingham, J.D.Fairhead, G.W.Stuart (Dept. of Earth Sci., Univ. of Leeds, Leeds, England).
Tectonophysics (Netherlands), vol.94, no.1-4, p.205-22 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
For pt.I see ibid., vol.94, no.1-4, p.205-22 (1983). Gravity studies of the Darfur uplift, Western Sudan, show it to be associated with a circular negative Bouguer anomaly, 50 mGal in amplitude and 700 km across. A three-dimensional model interpretation of the Darfur anomaly, using constraints deduced from geophysical studies of similar but more evolved Kenya and Ethiopia domes, suggests either a low-density laccolithic body at mid-lithospheric depth (~60 km) or a thinned lithosphere with emplacement at high level of low-density asthenospheric material. The regional setting of the Darfur uplift is described. The data suggest that extensional tectonics and passive rifting, resulting in the subsiding sedimentary rift basins associated with the Ngaoundere, Abu Gabra, Red Sea and Gulf of Aden rifts, are more typical of the early stage development of passive continental margins than the active domal uplift and development of rifted features associated with the Darfur, Kenya and Ethiopia domes.

69182 Baikal rift: active or passive?—comparison of the Baikal and Kenya rift zones. N.A.Logatchev, Y.A.Zorin, V.A.Rogozhina (Inst. of the Earth's Crust, Acad. of Sci., Irkutsk, USSR).
Tectonophysics (Netherlands), vol.94, no.1-4, p.223-40 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
The comparison of geological and geophysical data from the Kenya and Baikal rift zones permits one to consider the formation of these zones to be associated with the development of wide asthenospheric upwellings beneath them. In this sense, both rifts are active. Differences between them in amounts of volcanics and geological features may be explained by a higher degree of partial melting of asthenospheric material beneath the Kenya rift.

69183 Processes of planetary rifting as seen in the rifting and break up of Africa. R.W.Girdler (School of Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Tectonophysics (Netherlands), vol.94, no.1-4, p.241-52 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
The problem of the way in which rifting and thinning of the lithosphere occurs is discussed. In Africa, a sequence of rift processes is seen from incipient rifting in the south, to block faulting (basin and range) in Tanzania, to full rift valley development in Kenya with volcanism increasing northwards through Kenya and Ethiopia. The sequence is accompanied by increasing thinning of the lithosphere northwards. Arguments are presented which strongly suggest that the faulting precedes the lithospheric thinning. These lead to the abandonment of the simple stretching model in which faulting follows thinning and its replacement by a model in which the 'thinning' is a consequence of rifting. Horizontal stresses first cause brittle fractures which allow hot material to rise from the asthenosphere and the eventual development of large asthenoliths.

69184 The distribution and implications of heat flow from the Gregory Rift in Kenya. K.Crane, S.O'Connell (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.253-75 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Data from geothermal mapping along the Kenyan Gregory Rift zone using ground and aerial infrared techniques indicate that an average of 11-30 MW/km are advectively emitted along the rift. The bulk of the advected heat is lost through the central part of the Kenyan dome. Two other secondary geothermal sites are at the northern and southern limits of the rift adjacent to rift bifurcation zones. Active thermal fields occur only 1/7 as frequently as rift volcanoes. Geothermal spacing could be controlled by the length of the heat source at the lithosphere-upper mantle boundary, the thickness of the crust and the length of the rift segment between major structural breaks.

69185 Constraints on rift thermal processes from heat flow and uplift. P.Morgan (Lunar & Planetary Inst., Houston, TX, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.277-98 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Heat is of fundamental importance in the genesis of continental rift zones. Heat flow data are available from the Baikal, Basin and Range (North America), East African, Rhine and Rio Grande rift systems, and most of the data indicate high heat flow. Data from the essentially non-volcanic sections of the East African rift system indicate normal to low heat flow, however. With the exception of the Basin and Range system, and parts of the Rio Grande system, the high heat flow appears to be restricted to the grabens, and is not measured on the broad domal or plateau uplifts associated with the rift systems. The uplifts associated with rifts typically are on the order of 1 to 2 km, with diameters of a few hundred kilometers or more, and the duration of the main phase of uplift is on the order of a few tens of million years, or less. These broad uplifts probably result from thermal changes in the lithosphere-asthenosphere system. Two thermal models of the lithosphere are developed for comparison with the heat flow and uplift data.

69186 The role of seismic refraction data for studies of the origin and evolution of continental rifts. K.H.Olsen (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Tectonophysics (Netherlands), vol.94, no.1-4, p.349-70 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).
Universal attributes of continental rift systems are crustal extension with associated asthenospheric upwelling or modification of the mantle beneath the rift axis. Continental rifting is thus greatly controlled, if not driven, by geodynamic processes in the lower lithosphere. Seismic refraction profiling is a technique for obtaining high-resolution data on structures, seismic velocities, and petrologic conditions in the deep crust and upper mantle. Status of presently available seismic refraction data in four major Cenozoic continental rift systems is reviewed in the light of extent of coverage in area and depth, reliability of velocity measurements, and outstanding structural and geodynamical problems that remain unanswered for each system. Evidence of crustal thinning, anomalous mantle at the Moho, as well as shallow and midcrustal velocity anomalies exist in all four examples. The Rhinegraben is the best constrained system from the point of view of seismic structure models.

69187 Paleomagnetism of the Bonin Islands and its tectonic significance. K.Kodama (Dept. of Geology, Kochi Univ., Kochi, Japan), B.H.Keating, C.E.Helsley.
Tectonophysics (Netherlands), vol.95, no.1-2, p.25-42 (1983).
Paleomagnetic samples were collected from six of the Bonin Islands located on the northeastern margin (27°N, 142°E) of the Philippine Sea. These volcanic islands are of Eocene age. Both lava flows and dikes were collected at each of 34 sites with Chichi-jima the largest island being sampled most extensively. Mean directions of the 27 sites on Chichi-jima are divisible into two groups showing antipolar relationships at the 95% confidence level. The low inclinations and deflected declinations of the Bonin Islands are interpreted as being due to tectonic rotation. Since the northward drift and clockwise rotation are consistent with the tectonic movement inferred for the West Philippine Basin by previous studies, the Bonin Islands appear to have been part of the basin before opening of the Shikoku and Parece Vela basins during the Miocene.

69188 Stress-induced fracturing and magnetic susceptibility anisotropy in the Bleiberg-Kreuth mining region, Austria. J.S.Rathore, H.J.Mauritsch (Dept. of Geophys. & Planetary Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).
Tectonophysics (Netherlands), vol.95, no.1-2, p.157-71 (1983).
A magnetic fabric study involving rock samples from above and below the ground was conducted in the mining region of Bleiberg-Kreuth, in Carinthia, Austria. Detailed magnetic fabric and fracture analyses show that the fractures and shear planes are related to the tectonically-produced magnetic fabric. Using this relationship, it is possible to delineate a time dependent tectonic evolution of the study region: the Bleiberg-Kreuth area underwent at least two phases of major compression with a period of relaxation in between. The shear angle and the angle of internal friction in rocks are important parameters for predicting fracture failure. It is shown how 'in-situ' evaluation of these parameters can be made using the magnetic susceptibility anisotropy. Determination of the degree of deformation within different rock types and directions of movement along shear planes also are demonstrated.

69189 Tectonic elements registered on the Landsat imagery in area of Yugoslavia and their practical meaning. M.Oluic (Industroprojekt, Zagreb, Yugoslavia), D.Cvijanovic.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.567-74 vol.1
The area of central and western part of Yugoslavia is analyzed on multispectral Landsat images. A great number of geomorphological and tectonic elements are registered, of which the most important are faults and ring structures. Many of them are seen for the first time. The data are compared with the results of exploration of seismic activity, geothermal and mineral occurrences, and ore occurences and layers, respectively. A relation is established between tectonic elements registered on the satellite images and the seismic activity registered so far and/or the known geothermal occurrences and ore layers. (7 refs.)

91.50 MARINE GEOLOGY AND GEOPHYSICS

69190 **Side-scan sonar mapping and computer-aided interpretation in the Santa Barbara Channel, California.** B.P.Luyendyk, E.J.Hajic, D.S.Simonett (Dept. of Geological Sci., Univ. of California, Santa Barbara, CA, USA).
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.365-88 (1983).
The authors experimented with digital processing of side scan sonar data taken in a 14 sq-km area of continental shelf offshore Southern California. The data were FM tape recorded during the survey and digitized and processed later in the laboratory. The digital image processing included both image correction and image enhancement. Geometric corrections were applied to correct for image distortions due to variable ship position and speed and sonar slant range. Enhancements that were tried included contrast stretching, band-pass filtering, image restoration (inverse filtering) and various edge enhancements such as density slicing and standard deviation filters. Interpretive procedures were also attempted and included digital mosaicking, stereoscopic viewing, and false-color display. The most effective processing was geometric correction combined with contrast stretching. Mosaicking proved difficult due to imprecise navigation (±50 m), but was very effective in increasing the understanding of the geologic structure in the survey area. (20 refs.)

69191 **East Pacific Rise near 13°N: geology of new hydrothermal fields.** R.Hekinian (Centre Oceanologique de Bretagne, Brest, France), M.Fevrier, F.Avedik, P.Cambon, J.L.Charlou, H.D.Needham, J.Raillard, J.Boulegue, L.Merlivat, A.Moinet, S.Manganini, J.Lange.
Science (USA), vol.219, no.4590, p.1321-4 (18 March 1983).
Abundant massive sulfide deposits are present at the crest of the East Pacific Rise near 13° North, where the opening rate is about 12 centimeters per year. Large manganese and helium-3 anomalies in seawater samples, evidence of intense present-day activity of hydrothermal springs, indicate that sulfides are still being produced along this segment of the rise. Massive sulfides also occur on adjacent off-axis seamounts. (13 refs.)

91.60 PHYSICAL PROPERTIES OF ROCKS AND MINERALS

69192 **Stress and displacement distributions around pyrite grains.** S.O.Selkman (Boliden Mineral AB, Grangesberg, Sweden).
J. Struct. Geol. (GB), vol.5, no.1, p.47-52 (1983).
Photomicrographs from two sulfide-mineralized areas in Scandinavia show fragments of pyrite in a relatively homogeneous ground mass. At the extremities of the fragments, quartz segregations are common. In order to understand the stress and displacement in the development of these mineral segregations, the finite element method has been used. Models have been constructed in order to simulate angular fragments or crystals in an incompetent ground mass, which have been subjected to a differential pressure. Several models have been deformed iteratively, simulating viscous behaviour. The results indicate that the magnitude of deformation depends on the viscosity contrast, the magnitude of external pressure and the orientation of the inclusion. The stress distribution is governed by the viscosity contrast and the form of the inclusion. The tensile stress areas in the models are comparable with the areas of mineral segregation in the samples. (19 refs.)

69193 **A dislocation model for the aragonite$\rightleftharpoons$calcite transition.** P.Gillet, M.Madon (Inst. de Phys. du Globe, Lab. de Phys. et Mecanique des Materiaux Terrestres, Paris, France).
Bull. Mineral. (France), vol.105, no.6, p.590-7 (1982). In French.
A dislocation model for aragonite-calcite transition is suggested. A dislocation splitting in the calcite basal plane (0001) and aragonite basal plane (001), whose first partial is dragging a stacking fault, is responsible for the transition (or for the nucleation stage). This mechanism accounts for experimentally observed topotactic relations. (23 refs.)

69194 **Microwave properties of saturated reservoirs.** J.N.Lange (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).
Geophysics (USA), vol.48, no.3, p.367-75 (March 1983).
Dielectric properties of saturated, porous geologic materials reflect the large difference in dielectric constant ϵ of typical saturating fluids such as water ($\epsilon=78$) or oil and gas ($\epsilon=1$-3). The deconvolution of in-situ dielectric properties of saturated porous materials into the component parts requires a detailed model of the composite material. Defining aspects of this model in the microwave frequency regime is the primary purpose of this investigation. A model is examined in which the dielectric constant of the composite is equal to the sum of the dielectric constants of the components weighted by the volume fraction occupied by each. That model is compared to measurements at microwave frequencies made on systems consisting of glass beads, quartz, or sand saturated with chlorobenzene, 1,2-dichloroethane, methanol, or air, and find satisfactory agreement. When water is the saturant an interaction between water and the solid matrix has an important effect on the composite dielectric constant. (7 refs.)

69195 **On the theory of depositional remanent magnetization in sedimentary rocks.** V.P.Shcherbakov, V.V.Shcherbakova (Inst. of Phys. of the Earth, Moscow, USSR).
Geophys. Surv. (Netherlands), vol.5, no.4, p.369-80 (Feb. 1983).
The effects of various factors such as thermal agitation, coagulation, anisotropy of susceptibility, and shape irregularity on the alignment of magnetic carrier grains during the process of acquisition of depositional remanent magnetization in sedimentary rocks is discussed. (17 refs.)

69196 **The effect of strain heterogeneity on graphical strain analysis methods.** P.E.Holm (Dept. of Geology, Univ. of Windsor, Windsor, Ontario, Canada).
Tectonophysics (Netherlands), vol.95, no.1-2, p.101-10 (1983).
The most frequently used graphical strain analysis methods have been derived based on the assumption of homogeneous strain for the sample size investigated. In view of the heterogeneity of strain generally displayed by naturally deformed rocks on all scales, it is important to determine what effect varying degrees of strain heterogeneity have on these methods. An oolitic limestone was deformed at various strain rates and temperatures in order to achieve the desired variation by altering the relative contributions of intercrystalline and intracrystalline deformation mechanisms. Coefficients of determination for the best fit line to plots of the long vs. short axes of the deformed ooids were obtained and compared to the coefficient from a simulated homogeneous deformation of the same limestone. The samples were subsequently analyzed by the graphical strain analysis methods proposed by Dunnet (1969) and Elliott (1970). The reduction in fluctuation of long axis orientation of strain markers that occurs during constant volume deformation allows reasonable average values of the strain to be obtained even when the degree of strain heterogeneity is high.

69197 **Faulting of rocks in three-dimensional strain fields. I. Failure of rocks in polyaxial, servo-control experiments.** Z.Reches, J.H.Dieterich (Dept. of Appl. Math., Weizmann Inst. of Sci., Rehovot, Israel).
Tectonophysics (Netherlands), vol.95, no.1-2, p.111-32 (1983).
The dependence of the number of sets of faults and their orientation on the intermediate strain axis is investigated through polyaxial tests, and theoretical analysis. Cubic samples of Berea sandstone, Sierra-White and Westerly granites, and Candoro and Solnhofen limestones were loaded on their three pairs of faces by three independent, mutually perpendicular presses at room temperature. Two of the presses were servo-controlled and applied constant displacement rates throughout the experiment. Most samples display three or four sets of faults in orthorhombic symmetry. These faults form in several yielding events that follow a state of elastic deformation. In many experiments, the maximum and the intermediate compressive stresses interchange orientations during the yielding events, where the corresponding strains are constant. The final stage of most experiments is characterized by slip along the faults.

69198 **Faulting of rocks in three-dimensional strain fields. II. Theoretical analysis.** Z.Reches (Dept. of Appl. Math., Weizmann Inst. of Sci., Rehovot, Israel).
Tectonophysics (Netherlands), vol.95, no.1-2, p.133-56 (1983).
For pt.I see ibid., vol.95, no.1-2, p.111-32 (1983). The model for the faulting of rocks in a three-dimensional strain field is derived. It is assumed that the strain applied on a rock is accommodated by slip along faults. It is shown that four sets of faults in orthorhombic symmetry are required to accommodate general, three-dimensional deformation. It is further assumed that the preferred faults, namely, those which are most likely to slip, require the minimum stress difference and minimum dissipation. The orientations of these theoretically preferred faults are derived, and are compared with the experimental results of Part I (Reches and Dieterich, 1983). Charts of the preferred faults predicted by the present model are given.

69199 **Microscopic mechanisms of magnetic rock forming.** V.A.Shashkanov, V.P.Shcherbakov, V.V.Metallova, I.N.Petrov, K.A.Stabrovskii.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.30-4 (Feb. 1983). In Russian.
The nature of metastable states of thin ferromagnetic grains and ways of converting them into the ground stable state are discussed. The energetics of the transition between the two-domain metastable state and one-domain stable state of a magnetite particle is considered theoretically. (5 refs.)

69200 **The effect of magnetostatic interaction on the magnetization of the ensemble of ferromagnetic mineral single domain particles.** M.A.Fedotova, V.A.Shashkanov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.1, p.100-2 (Feb. 1983). In Russian.
The effect of magnetostatic interaction on magnetic properties of rocks is investigated. Equations for total and remanent magnetization have been derived in the case of strong magnetostatic interaction between single domain ferromagnetic particles. From them expressions for J_{rs}, Q_{rs} and x have been found. (4 refs.)

91.65 GEOPHYSICAL ASPECTS OF GEOLOGY, MINERALOGY AND PETROLOGY

69201 A feldspar-liquid geothermometer. M.P.Smith (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.193-5 (March 1983).
An expression that can be use to accurately calculate one atmosphere equilibrium temperatures from the compositions of coexisting feldspars and liquids was derived from experimentally studied natural systems and a wide range of simple systems. This expression is a superior predictor of temperature compared with other feldspar-liquid geothermometers. (61 refs.)

69202 Electron microscope studies of minerals: phase boundaries in an extremely slowly cooled clinopyroxene (augite). E.S.Crawford, J.A.Folkes, J.O.Williams (Edward Davies, Chem. Labs., Univ. Coll. of Wales, Aberystwyth, Wales), A.C.Barnicoat, M.J.O'Hara.
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.21-30 (8 May 1983).
High resolution electron microscopy has been used to study the nature of exsolution lamellae that developed during extremely slow and prolonged cooling and depressurization of an aluminium rich augite (high Ca clinopyroxene) taken from a layer of garnet-augite rich gneiss that outcrops on the north side of Scourie Bay, Sutherland, northwest Scotland. These sets of lamellae, which probably formed mainly during the middle of this evolution, were identified as amphibole, pigeonite and hypersthene. Observation of these forms enabled the relation between the phases and the cooling history of the rock to be established. (26 refs.)

69203 Origin of the inverted metamorphism of the Lower Himalayas, central Nepal. K.Arita (Dept. of Geology & Mineralogy, Hokkaido Univ., Sapporo, Japan).
Tectonophysics (Netherlands), vol.95, no.1-2, p.43-60 (1983).
The southern slope of the central Nepal Himalayas is divided geologically by the Main Central Thrust zone into the underlying Midland metasediment zone (Lower Himalayas) in the south and the overlying Himalayan gneiss zone (Higher Himalayas) in the north. The mineral composition and paragenesis of the rocks in the present area indicate an inverted metamorphism from the Midland metasediment to the Main Central Thrust zones, that is, the metamorphic grade of the Midland metasediment zone increases upward toward the thrust zone from the chlorite to the biotite zones of the greenschist facies, and the greenschist-amphibolite transitional zone is attained in the thrust zone. It is concluded that the Himalayan gneisses suffered a polymetamorphism. The younger metamorphism resulted in a retrograde metamorphism of the Himalayan gneisses together with the above-mentioned inverted metamorphism and a anatectic melting in depth. This was caused by shear heating due to the thrust movement along the Main Central Thrust zone during the Alpine tectonism.

69204 The development and application of a geological simulation model. M.G.Foley, G.M.Petrie (Pacific Northwest Lab., Richland, WA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.288-90, vol.12
Describes the Geological Simulation Model developed under the Assessment of Effectiveness of Geologic Isolation Systems project at the Pacific Northwest Laboratory for the Department of Energy. It is a quasi-deterministic process-response model which simulates the development of the geologic and hydrologic systems of a groundwater basin for a million years into the future. Effects of natural processes on the ground-water hydrologic systems are modeled principally by rate equations. The combined effects and synergistic interactions of different processes are approximated by linear superposition of their effects during discrete time intervals in a stepwise-integration approach. (no refs.)

69205 Geologic observations of the northern boundary of the Caribbean Plate across Central America as seen by Seasat and SIR-A. P.Rebillard, T.Dixon, T.Farr (Jet Propulsion Lab., Pasadena, CA, USA).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.593-9 vol.1
A mosaic of four digitally correlated Seasat synthetic aperture radar images (rev 759) over Central America covers the northwestern Caribbean Plate boundary. The radar data extend from the Amatique Bay (Golfo de Honduras) in the northeast to the Pacific Ocean (Puenta Remedios) in the southwest. Space Shuttle Imaging Radar (SIR-A) data-take 18 overlaps the main part of the Seasat mosaic. SIR-A data permit more observations over the Central American Cordillera, where strong layover limited the amount of information obtained by Seasat. The radar coverage delineates the major strik-slip faults of the region (Cuilco-Chixoy-Polochic, Motagua and Jocotan) which have acted as the Caribbean-Americas plate boundary. It also discriminates volcanic terranes related to subduction of the Cocos Plate under the Caribbean Plate. (4 refs.)

91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

69206 Acoustic fluidization [rock slides]. H.J.Melosh (Lunar & Planetary Lab., Univ. of Arizona, Tucson, AZ, USA).
Am. Sci. (USA), vol.71, no.2, p.158-65 (March-April 1983).
Can sound waves explain why dry rock debris appears to flow like a fluid in some energetic geologic events? The authors describe how this process can explain the observed low angle flows of large-scale rockslides. This process can also explain some of the observed features of meteorite craters. (27 refs.)

69207 The tempo of geomorphological change: evidence from southeastern Australia. R.W.Young (Dept. of Geography, Univ. of Wollongong, Wollongong, Australia).
J. Geol. (USA), vol.91, no.2, p.221-30 (March 1983).
A revised denudational chronology based on K-Ar dating of basalts for much of southeastern Australia shows that many major topographic features are far older than was previously realized. Some upland surfaces originated in the Mesozoic and others in the Early Tertiary; in some areas the last major uplift and onset of canyon cutting occurred prior to the Mid-Oligocene. Apart from the slow headward extension of canyons and localized high level stripping, much of the region had taken on approximately its present-day form by the Mid-Miocene. Paradoxically, however, none of the mechanisms that have been proposed to explain the survival of paleoforms hold. These instances may well be typical of large parts of the interior of tectonic plates, and a revision of widely held estimates of modal rates of denudation seems required. (43 refs.)

69208 Gas respiration of Earth. E.V.Borodzich, A.N.Eremeev, I.N.Yanitskii.
Priroda (USSR), no.2, p.18-27 (1983). In Russian.
The phenomenon of the Earth's gas respiration (the flow of gases deep inside the Earth which sometimes emerge violently, such as nitrogen, hydrogen or methane) is studied. An attempt is made to isolate the areas of the Earth in which this phenomenon emerges on the surface by measuring the distribution of helium concentrations in underground water. A brief outline of the study of natural gases is given with a detailed account of the INGEM-1 membrane-type high-sensitivity water-helium photographic device. The dangers inherent in deep drilling (particularly in the gas-oil industry) are discussed with special reference to anomalously high formation pressures. Some of the consequences of the discoveries made to date in this field are assessed as well as possible future developments. (14 refs.) *L.M.H.*

69209 Interpretability of linear phenomena on Seasat-1 imagery in the western coastal zone of Belgium in relation to the azimuthal and range resolutions. H.Dufourmont (Lab. for Regional Geography & Landscape Studies, State Univ. of Ghent, Ghent, Belgium).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.249-53 vol.1
The visual interpretability of linear features on SEASAT imagery is checked by means of comparison of variables two by two. The orientation of the flightline seems to influence the detectability of lines on the image. This assessment harms strongly the visual interpretability of linear features. (no refs.)

69210 Analysis of a multisensor image data set of south San Rafael Swell, Utah. D.L.Evans (Jet Propulsion Lab., Pasadena, CA, USA).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.255-9 vol.1
A Shuttle Imaging Radar (SIR-A) Image of the southern portion of the San Rafael Swell in Utah has been digitized and registered to coregistered Landsat, Seasat, and HCMM thermal inertia images. The addition of the SIR-A image to the registered data set improves rock type discrimination in both qualitative and quantitative analyses. Sedimentary units can be separated in a combined SIR-A/Seasat image that cannot be seen in either image alone. Discriminant Analyses show that the classification accuracy is improved with addition of the SIR-A image to Landsat images. (6 refs.)

69211 Seasat/SIR-A digital registration over Algeria. P.Rebillard, C.Elachi, M.Naraghi, J.Soha, W.Stromberg (Jet Propulsion Lab., Pasadena, CA, USA).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.271-6 vol.1
Seasat Synthetic Aperture Radar (SAR) and Shuttle Imaging Radar (SIR-A) data over northeastern Algeria have been compared and studied using digital registration. Preliminary results of this work show that: (1) both radars delineate in the same way the same features on the ground, (2) the Seasat image shows a strong difference between the Chott Melrhir and its environment, not seen in the same way by SIR-A, and (3) SIR-A data enhance more details on the floor of the Chotts, presumably due to the look angle or due to flooding conditions which may have occurred prior to the SIR-A experiment (November 12-14, 1981). (6 refs.)

69212 Use of SLAR lateral radar and Landsat satellites in geomorphspedological surveys carried out in the Venezuelan Amazon. M.Pouyllau (Domaine Univ., Talence, France).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.289-300 vol.1 In French.
For the 1:250000 scale geomorphic pedological survey of the Venezuelan Amazon, both side looking airborne radar SLAR stereoscopic images and ranges, and Landsat imagery have been used by the authors. The preliminary interpretations of the SLAR images have been completed with field surveys and at large and small scales and extrapolations on 1 square degree. The cartographic boundary adjustments have been performed using Landsat imagery. The multitemporal (space-craft) and multidimensional (radar) vectors association has permitted a previous soil and geomorphic estimation on about 13 millions hectares. The author presents the first results and the methodology used. (15 refs.)

69213 Remote sensing methods for geological investigations in the USSR to date and in future. V.B.Komarov (Lab. of Airborne Methods, Moscow, USSR).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.503-11 vol.1
Data obtained by various remote sensors installed on aircraft or space vehicles are applied in the USSR to all investigations related to the study and utilization of natural resources and to geological mapping and mineral exploration, in particular. Images obtained in the visible, infrared and radiowave ranges of the electromagnetic spectrum are broadly used for this purpose. In order to enhance informative features of the imagers, different methods of photographic transformation are elaborated, which greatly facilitate the interpretation process. Algorithms and programmes of computer-based processing of remote sensing data are currently being elaborated. (7 refs.)

69214 Use of SPOT simulations for geological studies. Comparison with aerial photographs and Landsat images example: Camares area-Massif central-France. G.Delpont, G.Weecksteen (Bur. de Recherches Geologiques et Minieres, Orleans, France).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.515-22 vol.1 In French.
A comparison between the interpretation of a SPOT simulation (1/13000), aerial photographs (1/60000) and Landsat images (1/50000), in the Camares area (France) is discussed. The influence of the hyperstereoscopic effect is discussed. (no refs.)

69215 Phenomenon of transparency in the metamorphic cover of a tin-tungsten leucogranite (Zamora, Spain). Comparison between multi spectral data processing and ground truth. B.Marconnet, C.Gagny (Univ. de Nancy, Vandoeuvre-les-Nancy, France), P.Leymarie, J.M.Monget.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.523-31 vol.1 In French.
The remote sensing, applied to a tin-tungsten mining district, has shown a phenomenon of granitic transparency in its metamorphic cover. This result is obtained from a comparative study between the anomalic area and a check area with similar morphological characteristics, by field work and multispectral data processing. (8 refs.)

69216 Comparison between spectral signatures of Landsat and SPOT on the sandstone outcrops of the Bandiagara Plateau-Mali. C.Bardinet (CTAMN-ENSMP, Valbonne, France), J.M.Monget, J.P.Blanck, J.Tricart.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.543-55 vol.1 In French.
The new information brought by the refined resolution of SPOT is used in the structural analysis of the Bandiagara Plateau. This formation is Cambro-Ordovician sandstone. The area surveyed by the SPOT simulation zuns perpendicular to the North rim of the plateau east of Dombara along a 10×20 km strip going from Saoura-Ambile down to the Dombara-Sinda track. The density and the main orientation of the lineaments are compared with the degree of surface weathering. The geomorphology of the facies is an important control of the Spot spectral signatures. (5 refs.)

69217 Equatorial long waves in geostationary satellite observations and in a multichannel sea surface temperature analysis. R.Legeckis, W.Pickel, G.Nesterczuk (Nat. Earth Satellite Service, Washington, DC, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.133-9 (Feb. 1983).
Geostationary satellite observations of a zonally oriented sea surface temperature front in the eastern equatorial Pacific were made between 1975 and 1981. Long waves appeared along the front mainly during the summer and fall, except during 1976, the year of an El Nino. The waves have averaged periods of 25 days and wavelengths of 1000 km. At the end of 1981, the long waves also were detected in a new sea surface temperature analysis based on multichannel infrared measurements from a polar-orbiting satellite. This quantitative analysis may improve the ability to resolve low-frequency equatorial waves motions from satellite observations. (21 refs.)

69218 Remote sensing of the sea-state using the 0.8-1.1 μm spectral band. L.Wald, J.M.Monget (Ecole Nat. Superieure des Mines de Paris, Valbonne, France).
Int. J. Remote Sens. (GB), vol.4, no.2, p.433-46 (April-June 1983).
Previous authors have reported on sea-state local variations detected by satellite in the 0.8-1.1 μm channel (Landsat MSS 7). The present authors demonstrate that in this channel the observed change in reflectance is mainly due to sea-state and use the Cox and Munk (1955) model to compute the sea-surface reflection coefficient for various geometrical conditions, and it is found that this model fits previous observations The model is then applied to cases of Landsat and SPOT sensors, and some useful recommendations are underlined. (19 refs.)

69219 Annual oceanic heat transports computed from an atmospheric model. J.R.Miller (Dept. of Meteorology & Phys. Oceanography, Rutgers Univ., New Brunswick, NJ, USA), G.L.Russell, Lie-Ching Tsang.
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.2, p.95-109 (March 1983).
Mean annual estimates of the oceanic poleward energy transport are obtained using a global atmospheric general circulation model. The computations are carried out by using the atmospheric model to determine the net annual heat flux into the ocean on an 8°×10° grid. Assuming no net annual heat storage, the annual surface heat fluxes into any zonal band must be accompanied by a corresponding meridional heat transport in the ocean. The results are compared with several direct and indirect calculations of oceanic meridional heat transports. (29 refs.)

69220 On the response of ocean currents to atmospheric cooling. D.Nof (Div. of Meteorology & Phys. Oceanography, Rosenstiel School of Marine & Atmospheric Sci., Miami, FL, USA).
Tellus Ser. A (Sweden), vol.35A, no.1, p.60-72 (Jan. 1983).
The response of steady ocean currents to forced atmospheric cooling is examined by a simplified two-layer model. The study focuses on currents, such as the Gulf Stream, which lose their heat to the atmosphere as they flow from one region to another. The model is inviscid and includes no coupling between the ocean and the atmosphere. Approximate solutions for specified cooling processes acting steadily on currents whose undisturbed speed is uniform are obtained analytically using a uniformly valid power series expansion. Possible application of this theory to the separated Gulf Stream which loses heat to the atmosphere as it flows from Cape Hatteras toward the northeast is discussed. (15 refs.)

69221 A time dependent, two-layer frontal model of buoyant plume dynamics. J.O'Donnell, R.W.Gravine (Coll. of Marine Studies, Univ. of Delaware, Newark, DE, USA).
Tellus Ser. A (Sweden), vol.35A, no.1, p.73-80 (Jan. 1983).
The dynamics of buoyant plumes, such as those observed at the mouths of the Mississippi and Connecticut Rivers, is investigated by considering the one-dimensional, time dependent behaviour of a two-layer, frontal model. The equations governing the flow in the main body of the plume are the long wave equations. The flow at the frontal boundary is modeled using jump conditions which incorporate the important dissipative processes. These equations are solved numerically using a shock patching technique that is accurate to second order in the long wave region and to first order at the front. (19 refs.)

69222 The influence of optical water type on the diurnal response of the upper ocean. T.D.Dickey (Dept. of Geological Sci., Univ. of Southern California, Los Angeles, CA, USA), J.J.Simpson.
Tellus Ser. B (Sweden), vol.35B, no.2, p.142-54 (April 1983).
The effect of optical water characteristics upon the diurnal variability of upper ocean temperatures and heat content is studied. A second moment turbulent closure scheme is employed for the simulations. Realistic thermal forcing as well as uniform and time varying wind stresses were used for boundary conditions. The diurnal amplitude in sea surface temperature and long term changes in heat content are strongly influenced by water type for constant wind speeds up to 6 m s^{-1}. The phasing of time-dependent wind stresses can lead to enhanced diurnal sea surface temperature amplitudes. Long term trends in heat content, however, are nearly independent of phase. The results of the simulations are consistent with the range of reported observations. (53 refs.)

69223 Microprocessor simulation of variable sea conditions. C.K.Li, J.R.Leigh (Engng. Div., Polytech. of Central London, London, England).
Electron. Lett. (GB), vol.19, no.10, p.397-8 (12 May 1983).
The technique of using a digital filter to simulate sea conditions is investigated and the functional relation between pole variation in such a filter and a corresponding significant wave height is established. The implementation of the digital filter using a microprocessor is also considered. (4 refs.)

69224 Survey of a Gulf Stream frontal filament. L.J.Pietrafesa (Dept. of Marine, Earth & Atmospheric Sci., North Carolina State Univ., Raleigh, NC, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.203-6 (March 1983).
An assortment of data is used to map and characterize a Gulf Stream filament. During 21-25 April 1980, a filament was captured as it moved through an array of moored current meters on the northeast Florida continental shelf. Current and temperature time series along with satellite VHRR and aircraft ART are used to reconstruct the event. The event is found to consist of an anticyclonically rotating, warm tongue inshore of a cold dome. The rotational scheme of the current in the warm tongue is opposite to previous hypotheses. Upwelling occurs in both the cold dome region and below the warm tongue. (11 refs.)

69225 A statistical dynamical theory of strongly nonlinear internal gravity waves. G.F.Carnevale (CSND, La Jolla Inst., La Jolla, CA, USA), J.S.Frederiksen.
Geophys. & Astrophys. Fluid Dyn. (GB), vol.23, no.3, p.175-207 (1983).
A statistical dynamical closure theory describing the interaction of strongly (and weakly) nonlinear two-dimensional internal waves in the presence of viscous dissipation and thermal conduction is derived. By applying renormalization methods originally formulated for quantum and classical statistical field theory, closures similar to the Direct Interaction and eddy-damped quasi-normal procedures of turbulence are derived. These methods are applied directly to the strongly nonlinear primitive field equations in Eulerian variables, thus avoiding the small amplitude assumptions inherent in the resonant interaction formalism. Propagator renormalization techniques provide formulas for the nonlinear internal wave frequency and spectral width in terms of the energy spectrum. The commonly used multiple time and space scale analysis is replaced by an analysis of the two-point correlation functions in terms of sum and difference variables. This permits the systematic development of a Landau equation. This generalization of the Boltzmann equation incorporates spatial variation of the group velocity and scattering due to spatial inhomogeneity. In the limit of weakly interacting waves and zero viscosity, the closures reduce to the resonant interaction approximation formalism. It is shown that the inviscid resonant interaction limit is singular in the sense that the equilibrium spectrum differs from that of the general

inviscid nonlinear off-resonant case. This is due to the fact that in the resonant interaction limit there is an additional constant of motion, viz. 'z-momentum'. The implications of these results are discussed. (55 refs.)

69226 Thermoconvective instabilities in a vertical cylinder of water with maximum density effects. I. Experiments. M.A.Azouni (Lab. d'Aerothermique, Meudon, France), C.Normand.
Geophys. & Astrophys. Fluid Dyn. (GB), vol.23, no.3, p.209-22 (1983).
Thermoconvective instabilities were investigated in cylindrical water layers under a 0-4°C vertical temperature gradient. For aspect ratios (height/diameter) ranging from 0.3 to 5.7, angular flow patterns were deduced from thermocouple measurements. The first two diametrically antisymmetrical modes ($n=1$, 2) were detected in the steady and unsteady regime. Slow oscillatory motions with a characteristic time of several hours were found for aspect ratios (height/diameter) larger than 2. The Fourier analysis of the angular temperature distribution at regular time intervals yields the result that the vertical nodal planes rotate around the cylinder axis in the oscillatory regime. A physical mechanism is suggested to explain the occurrence of such oscillatory instability. (17 refs.)

69227 Thermoconvective instabilities in a vertical cylinder of water with maximum density effects. II. Theory: onset of convection. M.A.Azouni (Lab. d'Aerothermique, Meudon, France), C.Normand.
Geophys. & Astrophys. Fluid Dyn. (GB), vol.23, no.3, p.223-45 (1983).
For pt.I see ibid., vol.23, no.3, p.209-22 (1983). The onset of convection in a vertical cylinder of water with regard to the density anomaly near 4°C is studied using linear stability analysis. Since the maximum density is located at the top of the cylinder, making the whole height of the cell gravitationally unstable, the Boussinesq equations are solved by the Galerkin method. Also for the special case of axisymmetrical flow pattern, direct numerical procedure and analytical method have been used. Special emphasis is given to the large aspect ratio limit (height of cylinder much larger than radius) for which the combined influence of the sidewalls and the nonlinear density gradient gives rise to a nonsymmetrical axial velocity profile. The maximum of the velocity amplitude is shifted towards the bottom of the cylinder as the aspect ratio increases and consequently the critical Rayleigh number is lower than when a linear density gradient is assumed. (28 refs.)

69228 The shape of the spectrum of energy containing components of the water surface in the weakly turbulent theory of wind waves. V.E.Zakharov, M.M.Zaslavsky.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.282-91 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
It is shown that for sufficiently developed wind waves the shape of the spectrum in the energy containing range is defined by dimensional considerations of the transfer equation for wind waves where the Kolmogorov's spectrum with respect to wave action flux p $S(\omega)=ap^{1/3}g^{4/3}\omega^{-11/3}\Theta_s(\omega/\omega_m)$ is realised (a is the non-dimensional coefficient dependent on the angular energy distribution for $\omega\sim\omega_m$, Θ_s is the 'spreaded' Heaviside function cutting the spectrum at the frequency of the spectrum maximum ω_m). The expression for $S(\omega)$ obtained is in a reasonable agreement with experimental data which permit to determine the non-dimensional coefficient a (≈ 0.83). A general qualitative picture of wind wave spectrum development is discussed which permits explanation of a number of their known properties: location of equilibrium range in the small scale part of the wave spectrum, the overshoot effect in the growth curves of spectral components, the decrease of the measure of narrowness of the wave spectrum in the course of wave development. (13 refs.)

69229 On mesoscale currents variability near North-West Africa. Yu.L.Djomin, E.Khagen, A.M.Gurina.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.292-300 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
A nonlinear numerical model has been used to simulate mesoscale and climatic currents near North-West Africa. The role of boundary conditions as well as horizontal and vertical eddy viscosity coefficients is discussed. Model results are compared with observed data on currents and hydro-chemical fields. (13 refs.)

69230 On the fine structure of the waters in the central part of the Red Sea. Yu.V.Nozdrin, E.A.Plakhin.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.301-8 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
Results of fine structure observations and time-space variability of the Red Sea waters are presented with calculations of fluctual components and parameters of fine structure. Analysis of these characteristics has yielded to conclusion of non-isopycnal origin of observed details of fine structure profiles and also to the connection between their variability in thermocline with semi-diurnal internal waves. (10 refs.)

69231 A baroclinic quasigeostrophic open ocean model. R.N.Miller, A.R.Robinson, D.B.Haidvogel (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).
J. Comput. Phys. (USA), vol.50, no.1, p.38-70 (April 1983).
A baroclinic quasigeostrophic open ocean model is presented, calibrated by a series of test problems, and demonstrated to be feasible and efficient for application to realistic and mid-oceanic mesoscale eddy flow regimes. Two methods of treating the depth dependence of the flow, a finite difference method and a collocation method, are tested and intercompared. Sample Rossby wave calculations with and without advection are performed with constant stratification and two levels of nonlinearity, one weaker than and one typical of real ocean flows. Using exact analytical solutions for comparison, the accuracy and efficiency of the model is tabulated as a function of the computational parameters and stability limits set; typically, errors were controlled between 1% and 10% RMS after two wave periods. Further Rossby wave tests with realistic stratification and wave parameters chosen to mimic real ocean conditions were performed to determine computational parameters for use with real and simulated data. Finally, a prototype calculation with quasiturbulent simulated data was performed successfully, which demonstrates the practicality of the model for scientific use. (23 refs.)

69232 The K_1 tide on the continental shelf from Nova Scotia to Cape Hatteras. P.R.Daifuku, R.C.Beardsley (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.3-17 (Jan. 1983).
A description is given of the K_1 tide over the northeast continental shelf off North America from Nova Scotia to Cape Hatteras. A K_1 cotidal map and current velocity map are presented. Offshore, there is a sweep of the tide from north to south, in general agreement with what is known of the oceanic K_1 tide in the North Atlantic. On the shelf, there is a trapping of phase lines to the coast, creating, in particular, a virtual amphidrome south of Cape Cod. Maximum amplitudes of around 15 cm are found in the Gulf of Maine, lowest around 7 cm south of Cape Cod. The K_1 currents are generally barotropic and current ellipses are aligned with the local topography. Maximum currents of about 10 cm s^{-1} are found south of Cape Cod. A simple model for the K_1 pressure field is developed, using the free and forced inviscid barotropic waves on a two-dimensional shelf. The model results confirm that the K_1 tide is composed of both a Kelvin wave and a shelf wave. (20 refs.)

69233 Propagation of the seasonal upwelling in the eastern equatorial Atlantic. J.Picaut (Lab. d'Oceanographie Phys., Univ. de Bretagne Occidentale, Brest, France).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.18-37 (Jan. 1983).
Several mechanisms have been proposed to explain the coastal and equatorial upwelling in the eastern Atlantic (Guinea Gulf). The most controversial is the mechanism of remote wind forcing in the western equatorial Atlantic suggested by Moore et al. (1978). Most of the possible explanations for the upwelling and their relative importance are discussed in view of recent observations. Detailed analysis of daily sea surface temperature (SST) collected at 16 coastal stations along the northern coast of the Guinea Gulf reveals that the upwelling event propagates westward along this coast at a mean speed of 0.7 m s^{-1}. The Northern Hemisphere and Southern Hemisphere coastal upwelling signals seem to start at the same time from the equator. These results and those of Servain et al. (1982) suggest that remote wind forcing west of the Gulf of Guinea is an important factor affecting the temperature in the Gulf. (75 refs.)

69234 On the potential energy of baroclinic Rossby waves in the North Pacific. L.Magaard (Dept. of Oceanography, Univ. of Hawaii, Honolulu, HI, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.38-42 (Jan. 1983).
Estimates of baroclinic Rossby wave potential energy spectra for various parts of the North Pacific were calculated from published material containing information about this energy in many different formats, definitions and units. The standardized results lead to frequency spectra of potential energy, ranging from 0.1 to 0.45 cpy (cylces per year), in 34 5° squares between 20 and 30°N; to energy spectra, ranging from 0.28 to 2.11 cpy, in eight subsections of the great circle route from Honolulu to San Francisco; and to a map of annual Rossby wave energy between 30 and 40°N. The most remarkable finding is a consistent sequence of interannual Rossby wave spectra, with a peak at 0.15 cpy (i.e., at a wave period of 6.7 years) covering the area 20-25°N and 175-130°W. (16 refs.)

69235 The effect of a mean current on Kelvin waves. R.Grimshaw (Dept. of Math., Univ. of Melbourne, Parkville, Victoria, Australia).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.43-53 (Jan. 1983).
The effect of a mean current on Kelvin waves is considered, including the case when the current is not in geostrophic balance. Because the problem is non-separable, a perturbation scheme is developed for weak shear from which the effect of the mean current on the wave phase speed and decay rate are determined. The perturbation scheme also establishes that in general the Kelvin wave contains all vertical modes. The special case of a two-layer fluid is considered in more detail. (3 refs.)

69236 Longshore coherence of currents on the Southern California shelf during the summer. C.D.Winant (Scripps Instn. of Oceanography, La Jolla, CA, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.54-64 (Jan. 1983).
Observations of horizontal currents and temperature made along a mid-shelf isobath during the summer on the Southern California shelf are used to determine longshore coherent length scales. The observations are characterized by weak atmospheric forcing and strong density stratification of the water column. For periods longer than a day, coherent longshore length scales of currents are around 25 km, while coherent length scales of temperature were longer than the instrumental array (57.5 km). For periods ranging from a day to an hour, near-surface motions were dominated by diurnal fluctuations which were coherent over lengths of 5 km, whereas near-bottom motions, dominated by semidiurnal fluctuations, showed evidence of a signal propagating up coast at phase speeds of order 1 m s^{-1}. The observed scales of motion in different frequency bands are used to estimate the dispersive properties of the shelf motions. (13 refs.)

69237 Summertime coastal currents in the northeastern Gulf of Mexico. G.O.Marmorino (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.65-77 (Jan. 1983).
Observations of currents and temperature at a mooring on the 18 m isobath, 30 km south of the Florida shoreline, are discussed for the 31-day period 15 August-15 September 1978. Tidal currents, having average amplitudes of ~10 cm s^{-1}, account for 85% of the observed kinetic energy. Low-frequency currents with maximum speeds of ~10 cm s^{-1} appear to be at least partly driven by local wind-stress events of magnitude ~0.2 dyn cm^{-2}. Frictional effects give rise to a veering with depth (in the Ekman sense) of both the low-frequency flow and the energetic, counterclockwise-rotating twice-daily tidal currents. Propagation of both the tidal signal and low-frequency coastal sea-level fluctuations (amplitudes <5 cm) is westward through the study area. (23 refs.)

69238 Mean flow generation on a continental margin by periodic wind forcing. D.W.Denbo, J.S.Allen (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.78-92 (Jan. 1983).
The generation of an alongshore mean flow by the nonlinear interaction of forced barotropic shelf waves over a continental margin is studied using a wind-forced, f-plane model with bottom friction in an attempt to develop a model for poleward eastern boundary undercurrents. It is assumed that the Rossby number is small and that the flow obeys a long-wave approximation. A periodic alongshore wind stress traveling along the coast forces the fluid by a nonzero wind stress at the coast (coastal forcing) or by a wind-stress-curl-driven oceanic flow that impinges on the slope (interior forcing). Expressions are derived for the alongshore (v) and cross-shelf (u) mean velocities in terms of the lowest order periodic velocities. An expression for the correlation coefficient of uv_x, where x is the cross-shelf coordinate, is derived that depends only on the sign of the bottom slope, the magnitude of friction, the local water depth and the forcing frequency. The momentum flux and Reynolds stress in the surface and bottom Ekman layers make a significant contribution to the mean flow. Further aspects of the flow are described. (19 refs.)

69239 Small-scale variations of the wind-driven coastal sea-level response in the West Florida Bight. G.O.Marmorino (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.93-102 (Jan. 1983).
Records from a number of temporary tide gage stations spaced an average of 20 km apart near Cedar Key, Florida, are used to examine the alongshore pressure gradient over length scales much smaller than before possible. In agreement with previous studies, an alongshore stress of 1 dyn cm^{-2} will produce a large-scale (over distances of several hundred kilometers) alongshore sea-level gradient on the order of 10^{-6}, sea level rising downwind. However, cross-shore stress is also important and, at short periods (~3.5

days), can be the more coherent forcing. Estimates of small-scale sea-level slope do appear to show systematic deviations from the larger scale slope, some of which seem to be related to alongshore variations in nearshore bathymetry. (10 refs.)

69240 Low-frequency free wave and wind-driven motions over a submarine bank. K.H.Brink (Woods Hole Oceanographic Instn., Woods Hole, MA, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.103-16 (Jan. 1983).
This study attempts to isolate the physics peculiar to a submarine bank. The particular model is barotropic and contains an infinitely long straight bank within an unbounded ocean basin. The low-frequency, free wave solutions consist of two infinite sets of modes, analogous to barotropic continental shelf waves, one set trapped to each side of the bank. In addition, a severely distorted double Kelvin wave is associated with the net depth difference across the bank. Inclusion of bottom friction representative of Georges Bank suggests that only one free wave (westward propagating on the south side) will have a sufficiently long decay time to be likely to be observed in nature. The spatial variation in local spindown time also causes the lines of constant wave phase to be no longer perpendicular to the isobaths. Steady, forced motions are considered for winds which vary slowly in the alongbank direction. When the Ekman scale depth is the same order as the minimal depth over the bank, the primary driving mechanism is related to the disruption of surface Ekman transport by bottom friction. (19 refs.)

69241 The wake of Hurricane Allen in the western Gulf of Mexico. D.A.Brooks (Dept. of Oceanography, Texas A&M Univ., College Station, TX, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.117-29 (Jan. 1983).
In August 1980, Hurricane Allen passed over a moored array of instruments recording current, temperature and conductivity in the western Gulf of Mexico. An alongshore surge occurred during the storm passage, with the horizontal current speed reaching 91 cm s^{-1} in the thermocline (200 m) and diminishing to 15 cm s^{-1} 32 m above the bottom (732 m). A wake of near-inertial frequency internal waves commenced after the storm passed the array. The alongshore current oscillation reached a maximum range of 50 cm s^{-1} within 3 days and decayed thereafter with a time scale of about 5 days. The current oscillations were clockwise-polarized and slightly elliptical, with a period of 22-23 h or about 85% of the local inertial period. Near-uniform upwelling of ±20 m occurred in the thermocline region (200-300 m) during the most intense part of the wake. Depth-leading phases of the horizontal current and temperature oscillations indicated downward radiation of wake energy. The wake oscillations were studied in detail. (13 refs.)

69242 Air-sea interaction as a propagator of equatorial ocean surface temperature anomalies. E.B.Kraus, H.P.Hanson (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.130-8 (Jan. 1983).
The westward propagation of equatorial sea surface temperature anomalies exceeds the surface drift velocity and is probably associated with propagating changes in the depth of the surface mixed layer and upper thermocline. These can be caused by equatorial Rossby waves and/or by air-sea interactions. In the present paper, it is shown that changes in the stress and heat flux associated with the passage of the air over an ocean surface of variable temperature can produce a westward propagation of the temperature pattern regardless of Coriolis effects. The phenomenon is investigated in the framework of a two-layer channel model. (19 refs.)

69243 Topographically controlled flow around a deep trough transecting the shelf off Kodiak Island, Alaska. G.Lagerloef (Pacific Marine Environmental Lab., NOAA, Seattle, WA, USA).
J. Phys. Oceanogr. (USA), vol.13, no.1, p.139-46 (Jan. 1983).
Current measurements from the axis of a deep trough normal to the coast and from the adjacent shelf show that the mean flow is barotropic and follows depth contours, conserving potential vorticity, to form a cyclonic vortex or meander over the trough. The data are interpreted as an example of an inertial Taylor-Proudman column on the continental shelf. The scale of the topographic variations dominates the potential vorticity balance and a simple steady-state numerical model is in good agreement with the data when the vorticity balance approaches the limit $\mathbf{U}.\nabla H=0$. Streamlines following isobaths converge over steeper topography and current speeds are nearly proportional to the local topographic gradient. Estimates from the data support this behavior and indicate that the $\sim$20 cm s^{-1} mean current around the trough is driven by a typical cross-shelf-averaged velocity scale of $\sim$5 cm s^{-1}. (16 refs.)

69244 Reflectance contrast observed by Landsat between a calm and a rough sea. L.Wald, J.M.Monget (Ecole Nat. Superieure des Mines de Paris, Valbonne, France).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.2, p.241-2 (Feb. 1983).
A model is used to predict changes in reflection coefficient as a function of wind speed. (14 refs.)

69245 New ice-forecasting procedures for the northwest Atlantic. B.A.Kogan, N.F.Orlov (Arctic & Antarctic Sci. Res. Inst., Murmansk, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.57-69 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.71-6 (1981).
Studies oriented to the development of new ice-forecasting procedures for the Davis and Denmark Straits and the Labrador Sea are reported. (6 refs.)

69246 Formation mechanisms of the oceanic mixed layer. B.D.Zholudev (Kabardino Balkarian State Univ., USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.61-6 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.77-82 (1981).
Relates laboratory study of the mixed layer, observations of its state in the open ocean, and numerical one-dimensional models of the upper layer of the ocean. Mixed layer characteristics are calculated for a storm observed in middle latitudes with allowance for the diurnal insolation cycle. (27 refs.)

69247 Interaction of swell waves with head winds. V.K.Makin (Leningrad Div., Inst. of Oceanology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.79-81 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.95-7 (1981).
A numerical model of the wind-wave interaction is used to investigate the damping of swell waves of 50 to 200 metres long under the action of a head wind. The damping time depends strongly on the frequency of the wave, increasing with decreasing frequency. For short swell waves it is necessary to take account of the energy lost in the interaction of the wave with the head wind. (7 refs.)

69248 A dynamical model of storm surges along island coasts. M.A.Fahmy, M.Zaki (Dept. of Engng. Math., Cairo Univ., Giza, Egypt).
Z. Angew. Math. & Phys. (Switzerland), vol.34, no.2, p.154-63 (March 1983).
A time-independent dynamical model of storm surge along island coasts using orthogonal curvilinear coordinates is presented. The curved annulus between an island coast and an arbitrary deep-water boundary is mapped conformally onto a rectangular image. Two configurations of island coasts are investigated; circular and elliptic coasts. The corresponding coordinates are circular polar and elliptic respectively. The linearized vertically-integrated equations of motion are used to model storm surges with two assumptions: (i) bottom stress is proportional to horizontal transport, and (ii) storm forces are shear stresses on water surface. Analytical solutions are presented for three dynamical cases: (i) a constant-depth basin acted upon by a uniform storm stress, (ii) variable-depth basin acted upon by a uniform-direction variable-magnitude stress, and (iii) a basin with closed depth contours acted upon by vortex-shaped storm stress. (7 refs.)

69249 Quality of upwelling radiance retrieved from Coastal Zone Colour Scanner (CZCS) data for ocean colour determination. S.M.Singh (Carnegie Lab. of Phys., Univ. of Dundee, Dundee, Scotland).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.697-706 vol.1
Discusses the inflight calibration quality of the Coastal Zone Colour Scanner (CZCS) detector. The atmospheric correction algorithm currently in use is based on the assumptions that (i) the aerosol path radiance is not attenuated by the Rayleigh atmosphere, (ii) the Rayleigh path radiance is not attenuated by the aerosol atmosphere and (iii) the azimuthal angle of the satellite-sensed radiation is a constant. The author develops another algorithm which does not use these assumptions. Some of the difficulties associated with these atmospheric correction algorithms are discussed. The author also includes a brief discussion on the uncertainty in the chlorophyll-like pigment concentrations. (27 refs.)

69250 Study of tidal vortices at the Naruto Strait through multi level remote sensing. T.Maruyasu, S.Onishi, T.Nishimura (Sci. Univ. of Tokyo, Chiba, Japan).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.735-44 vol.1
Stirring whirlpools in the tidal stream at the Naruto Strait were surveyed through multi level remote sensing from airplane and Landsat. Small scale tidal vortices were surveyed from air at lower altitude, and the large scale tidal vortices were surveyed from Landsat and from air at higher altitude. It was revealed that the tidal vortices take the main role in the water mixing around the strait, after the hydrodynamical interpretation of the remotely sensed data aided by the hydraulic model tests. (1 ref.)

69251 Microwave signatures of young sea ice and its influence on ice concentration algorithms. C.Matzler (Inst. of Appl. Phys., Univ. of Berne, Berne, Switzerland).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.757-65 vol.1
Passive and active microwave signatures show large variations when new sea ice is formed in the marginal ice zone. Whereas the emissivities increase monotonically with increasing ice thickness as a result of decreasing surface wetness, no monotonic change is found for backscattering coefficients due to the strong influence of the surface roughness. Therefore, passive sensors are preferable for ice concentration algorithms. These results are based on measurements of microwave signatures made from icebreaker based instruments during the Norwegian remote sensing experiment in 1979. (6 refs.)

69252 Sea ice classification from infrared thermometry over the North Water, winter 1980/81. K.Steffen (Dept. of Geography, Swiss Federal Inst. of Technol., Zurich, Switzerland).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.767-76 vol.1
Report a sea ice remote sensing study carried out within the framework of a larger research project concerned with the so called North Water. The N.W. is recurring polynya (an Arctic sea anomaly associated with a high percentage of young ice and open water) and one of the largest such phenomena in the Northern Hemisphere. The goal of the N.W. project is the study of the attributes of this polynya and of its modifying effects on the regional climate. The author carried out six remote sensing flights at an altitude of 300 m with a total profile length of 2300 km each. A precision radiation thermometer (PRT-5) served to measure the thermal radiation emitted by the sea surface. It was found that different sea ice types are associated with distinguishable surface temperature levels and it is therefore possible to derive a sea ice classification from the thermal radiation measurements. For the Lancaster Sound the relation between occurrence frequency of fractures (expressed in class percentages) and fracture width was investigated. (7 refs.)

92.20 INTERDISCIPLINARY ASPECTS OF OCEANOGRAPHY

69253 Radiocarbon in the Weddell Sea as observed in a deep-sea coral and in krill. R.L.Michel (Scripps Instn. of Oceanography, La Jolla, CA, USA), E.M.Druffel.
Geophys. Res. Lett. (USA), vol.10, no.3, p.190-2 (March 1983).
Radiocarbon measurements were performed on krill and coral samples collected from the Weddell Sea during IWSOE '80. These are the first radiocarbon measurements available from this area since 1973. These data reveal carbon-14 levels for Weddell surface water and southern Weddell Shelf water. These data indicate that the radiocarbon levels in surface waters in 1980 were the same or slightly lower than those present in 1973. In addition, an unusually low $\Delta^{14}C$ value for shelf water (from coral) at 500 m is evidence that Warm Deep Water (WDW) may penetrate much further and more frequently onto the shelf region than had previously been expected. (16 refs.)

69254 Modelling nearshore oil slick trajectories. T.Beer (Centre for Resource & Environmental Studies, Australian Nat. Univ., Canberra, Australia), R.B.Humphries, R.Bouwhuis.
Mar. Pollut. Bull. (GB), vol.14, no.4, p.141-4 (April 1983).
The need to assess the probability of accidental oil spills, and their fate, in the Spencer Gulf, was one of the major problems addressed by the draft environmental impact statement for the proposed Cooper Basin liquids project facility at Stony Point, South Australia. As a first stage in the assessment of this risk, an oil spill trajectory model was constructed in order to determine the likely fate of spilled oil over all seasonal conditions. The choice of appropriate counter-measures were guided by the results of this model. Features of the model included: (i) a concentration upon environmental impact assessment. To achieve this the model was biased so as to overestimate environmental damage in sensitive areas; (ii) the use of a matrix wind factor to describe wind effects on the oil; (iii) model verification through the use of model output statistics linking model results with field trials; (iv) validation of the model with a series of experiments six months after the original field trials. (6 refs.)

69255 Marine litter distribution and composition in the North Sea. T J.Dixon, T.R.Dixon.
Mar. Pollut. Bull. (GB), vol.14, no.4, p.145-8 (April 1983).
Following the development of marine litter surveillance methodologies for use on beaches, this study shows the feasibility of similar surveys at sea. The results indicate widespread distribution of marine litter in the surface waters of the North Sea, especially plastics. Not only does this draw attention to the need for the implementation of Annexe V of the MARPOL Convention, but serious consideration should be given now to the designation of the North Sea as a 'special area' such that the dumping of all garbage from ships, except food wastes, should be prohibited. 92.40 HYDROLOGY AND GLACIOLOGY

69256 A dynamical model for the overland flow on an infiltrating catchment. K.Pingoud (Systems Theory Lab., Helsinki Univ. of Technol., Espoo, Finland).
Appl. Math. Modelling (GB), vol.7, no.2, p.128-34 (April 1983).
An approximate lumped parameter model for the surface runoff phenomenon on a catchment is presented. It consists of two submodels, which are spatial discretizations of the basic partial differential equations of overland flow and infiltration. The aim of the model is to describe the dynamical input-output relationship between the rainfall rate and the surface runoff from the catchment. The boundary conditions of the infiltration process are modelled in an approximate way so that the number of state variables in the model can be reduced. With the aid of a single model parameter it is possible to describe simple catchment shapes like linearly converging and diverging surfaces. The model structure is flexible so that it can also be applied to more complex catchment configurations. (21 refs.)

69257 Using Landsat imagery interpretation for underground water prospecting around Qena Province, Egypt. A.B.Salman (Remote Sensing Centre, Nuclear Materials Corp., Cairo, Egypt).
Int. J. Remote Sens. (GB), vol.4, no.2, p.179-89 (April-June 1983).
Deals with visual interpretation of Landsat satellite images covering an area of 27000 km^2 around Qena Province, Upper Egypt. Geological, structural lineaments and drainage density maps are constructed. From these maps the significant hydrogeological features are extracted, correlated and utilised in locating some areas of high underground water content. (9 refs.)

69258 The chemistry of geothermal waters in Iceland. II. Mineral equilibria and independent variables controlling water compositions. S.Arnorsson, E.Gunnlaugsson (Sci. Inst., Univ. of Iceland, Reykjavik, Iceland), H.Svavarsson.
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.547-66 (March 1983).
For pt.I see ibid., vol.46, p.1513-32 (1982). The major element chemistry of Icelandic geothermal waters is predictable provided two parameters are known. This follows from an attainment of, or a close approach to, an overall chemical equilibrium in the geothermal systems at temperatures as low as 50°C. It is considered that the geothermal system composition, temperature and kinetic factors determine which alteration minerals form. The system composition is not so much fixed by rock composition as by the rate of leaching of the various constituents from the fresh rock and the composition of inflowing water. The water chemistry is determined by the system composition and the external variables acting on the system. They include temperature and the mobility of chloride. (36 refs.)

69259 Evaluating space-time variability of heat and water balance components on the eastern part of the Baikal-Amur trunkline right-of-way. V.N.Adamenko, A.L.Bodganov, P.V.Novorotskii (Inst. of Limnology, Acad. of Sci, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.47-56 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.58-70 (1981).
Remote methods for measurement of underlying-surface albedos and temperatures are used as a basis for estimation of the spatial variability of albedo, radiation temperature, and radiation balance for characteristic landscape types along the eastern right-of-way of the Baikal-Amur Trunkline. Heat and water balance components are estimated theoretically as functions of slope exposures and gradients under the conditions of mid-mountain terrain. Heat-balance components and their relationships are estimated from observations made on seven test plots. (20 refs.)

69260 Relationships for predicting maximum ice-dam (ice-run) water levels at the spring opening of Siberian rivers. I.Ya.Liser (Western Siberian Regional Sci. Res. Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.67-71 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.83-7 (1981).
A proposal for predicting maximum damming (ice-run) water levels at the spring opening of Siberian rivers is offered. It is also proposed that early-winter water levels, which characterize icing conditions, be included in the forecasting. (10 refs.)

69261 Joint estimation of annual and multiyear probabilities of water discharge volumes exceeding the daily averages. A.M.Komlev (Perm State Univ., Perm, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.82-4 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.97-100 (1981).
It is proposed that the annual and multiyear variabilities of hydrometeorological elements be estimated from persistence-time curves of equiprobable values. An example in which these curves are constructed from the daily-average volumes of the Kama River at Bondyug is presented. (10 refs.)

69262 A three dimensional hybrid finite element-finite difference scheme for groundwater simulation. D.K.Babu, G.F.Pinder (Dept. of Civil Engng., Princeton Univ., Princeton, NJ, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.292-4, vol.2
A hybrid finite element-finite difference scheme that employs finite elements in the areal directions and finite difference approximations in the vertical directions, is constructed for solving transient groundwater flow problems. The scheme is applied to predict the transient hydraulic heads generated in a finite, confined aquifer receiving water from a partially penetrating injection well of finite radius. Heuristic error analysis is presented for this problem. (2 refs.)

69263 Automatic mapping of lakes for small-scale maps using digital Landsat imagery. E.A.Fleming (Surveys & Mapping Branch, Dept. of Energy, Mines & Resources, Ottawa, Canada).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.965-70 vol.1
In much of Canada, lakes predominate the landscape, but the cartographic generalization employed in producing maps at scales of 1:500000 and 1:1000000 often fails to capture this aspect of the terrain. A more realistic rendition of the hydrology can be obtained if the conventional cartography of drainage is combined with lakes as imaged on Landsat MSS. Thematic extraction of the water using geometrically corrected digital imagery has proved feasible for this purpose. (no refs.)

92.60 METEOROLOGY

(see also 43.28 Aeroacoustics and atmospheric sound)

69264 Observations of optical lightning emissions from above thunderstorms using U-2 aircraft. H.J.Christian, R.L.Frost, P.H.Gillaspy, S.J.Goodman, O.H.Vaughan,Jr. (George C. Marshall Space Flight Center, AL, USA), M.Brook, B.Vonnegut, R.E.Orville.
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.120-3 (Feb. 1983).
In order to determine how to achieve orders of magnitude improvement in spatial and temporal resolution and in sensitivity of satellite lightning sensors, better quantitative measurements of the characteristics of the optical emissions from lightning as observed from above tops of thunderclouds are required. A number of sensors have been developed and integrated into an instrument package and flown aboard a NASA U-2 aircraft. The objectives have been to acquire optical lightning data needed for designing the Lightning Mapper Sensor, and to study lightning physics and the correlation of lightning activity with storm characteristics. The instrumentation and observations of the program are reviewed and their significance for future research is discussed. (6 refs.)

69265 Some hail research in China. Jia-liu Xu (Office of Weather Res. & Modification, NOAA/ERL-CIRES, Boulder, CO, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.124-32 (Feb. 1983).
Considers the geographical and seasonal distributions of hail in China, hailstorm structure, hail embryos, hailstone stratification and hail size distributions, graupel, and cloud and hail growth models. (15 refs.)

69266 The 1980-81 drought in eastern Pennsylvania. D.J.Perkey, K.N.Young, C.W.Kreitzberg (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.140-7 (Feb. 1983).
Investigates the causes and consequences of the 1980-1 drought as it affected eastern Pennsylvania. Precipitation data indicate below-average amounts during this period, while temperature records show above-average values. These values show that a meteorological drought did occur in this region during 1980 and 1981. However, meteorological factors were only part of the cause of the region's water-shortage. In addition to analyzing the drought's meteorological origin, this study probes the anthropogenic and regional social-political causes and impacts of the water shortage. Some of the complexities involved in trying to prepare for the normal fluctuations in a climatic variable such as precipitation amount are illustrated. (12 refs.)

69267 A note on the relationship between relative precipitation frequency and percent of correct forecasts. R.J.Reed (Dept. of Atmospheric Sci., Univ. of Washington, Seattle, WA, USA).
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.148-9 (Feb. 1983).
The theoretical relationship between these quantities is derived for the full range of precipitation frequency with use of a model that assumes the forecasts to be unbiased and the Heidke Skill Score to be independent of precipitation frequency. It is shown that for this simple model the relationship is quadratic. (2 refs.)

69268 Fast Fourier transform for numerical weather prediction models on vector computers. C.Temperton.
Bull. Dir. Etud. & Rech. Ser. C (France), no.1, p.159-62 (1983). In English. (1^{er} Colloque International sur les Methodes Vectorielles et Paralleles en Calcul Scientifique (1st International Colloquium on Vectorial and Parallel Methods in Scientific Calculations), Paris, France, 17-18 March 1983).
Outlines the uses of the Fast Fourier Transform in numerical weather prediction models, and how the algorithm is most efficiently implemented on vector computers. On the Cray-1, it is sufficient to perform a number of transforms in parallel, but on the Cyber 205 a more complicated approach is necessary in order to achieve maximum efficiency. Multiple FFT packages have been developed on both machines, using a version of the algorithm specialized for real data. Timings are given for the Cray-1, and for both 64-bits and 32-bits arithmetic on the Cyber 205. (16 refs.)

69269 Diagnostic analysis and spectral energetics of a blocking event in the GLAS climate model simulation. Tsing-Chang Chen (Dept. of Earth Sci., Iowa State Univ., Ames, IA, USA), J.Shukla.
Mon. Weather Rev. (USA), vol.111, no.1, p.3-22 (Jan. 1983).
Examines diagnostically the structure and spectral energetics of an amplified persistent blocking ridge and trough pattern that occurred in one of the GLAS climate simulations. This particular model simulation was performed by Shukla and Bangaru (1979) to study the sensitivity of the quasi-stationary waves to the North Pacific sea surface temperature anomalies. The spectrally filtered Hovmoller diagram shows that wavenumbers 2 and 3 in the anomaly run become stationary near their climatological locations. The constructive interference of wavenumbers 2 and 3 forms two persistent blocking ridges: one in the west coast of North America and the other in western Europe. Spectral energetics analysis of this blocking case shows that A_2 and A_3, the available potential energy of wavenumbers 2 and 3, are supplied by the conversion from zonal available potential energy. K_2 and K_3, the kinetic energy of these two waves, are maintained by different processes: K_2 is maintained by conversion from A_2 to K_2, a baroclinic process, while K_3 is mainly maintained by conversion from K_Z, the zonal kinetic energy, to K_3, a barotropic process. (31 refs.)

69270 The relationship between convective adjustment, Hadley circulation and normal modes of the ANMRC spectral model. K.Puri (Australian Numerical Meteorology Res. Centre, Melbourne, Victoria, Australia).
Mon. Weather Rev. (USA), vol.111, no.1, p.23-33 (Jan. 1983).
By expanding model forecasts with and without convection in terms of three-dimensional normal mode functions it is shown that convective adjustment mainly influences gravity modes for vertical mode 4 of the nine-level ANMRC spectral model. It is also shown that the dominant influence of convective adjustment occurs in the lowest frequency gravity modes for all zonal wavenumbers and in particular wavenumbers 0 to 8. By applying various gravity mode filters it is shown that the Hadley circulation in this model is also dominated by these low-frequency gravity modes. (11 refs.)

69271 Vertical differencing of the primitive equations in sigma coordinates. A.Arakawa, M.J.Suarez (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.34-45 (Jan. 1983).
A vertical finite-difference scheme for the primitive equations in sigma coordinates is obtained by requiring that the discrete equations retain some important properties of the continuous equations. A family of schemes is derived whose members conserve total energy, maintain an integral constraint on the vertically integrated pressure gradient force, have a local differencing of the hydrostatic equation, and give exact forms of the hydrostatic equation and the pressure gradient force for particular atmospheres. The proposed scheme is a member of this family that in addition conserves the global mass integral of the potential temperature under adiabatic processes. (10 refs.)

69272 Statistical field significance and its determination by Monte Carlo techniques. R.E.Livezey, W.Y.Chen (NOAA, Washington, DC, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.46-59 (Jan. 1983).
The effects of number and interdependence in evaluating the collective significance of finite sets of statistics are frequently non-trivial, especially for spatial networks of time-averaged meteorological data. These effects can be taken into account in two steps: by first prescreening for significance assuming data independence and then, if necessary, by taking into consideration dependence through the use of estimated effective degrees of freedom and the binomial distribution or, failing that, Monte Carlo simulation. Seasonal averages of 700 mb height data are used to illustrate the problem and to demonstrate how the data set properties are taken into account. (28 refs.)

69273 On the nonlinear versus linearized low boundary conditions for topographically forced stationary long waves. Ka Kit Tung (Dept. of Math., MIT, Cambridge, MA, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.60-6 (Jan. 1983).
For quasi-geostrophic stationary long waves forced by topography, the nonlinear lower boundary condition is derived in terms of the geopotential height and compared with the linearized version. The common practice of replacing terms describing the flow over and around a mountain by upstream zonal flow over the mountain and evaluating the resulting condition at sea level is found to be a good approximation for the cases considered and does not need to be modified as sometimes suggested. Specifically, it is found that this approximation does not affect, for most cases, the lower boundary condition expressed in terms of the geopotential height provided that the stationary wave is not near resonance. At resonance, the eddy advection terms may become important for large-amplitude waves when dissipation and surface diabatic heating are taken into account. (11 refs.)

69274 Numerical modeling of diurnal convergence oscillations above sloping terrain. J.Paegle, D.W.McLawhorn (Dept. of Meteorology, Univ. of Utah, Salt Lake City, UT, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.67-85 (Jan. 1983).
Documents the development and sensitivity testing of a numerical model designed to predict diurnal cycles of boundary-layer flows of synoptic horizontal scale above sloping terrain. This application requires detailed vertical resolution of low-level jets, mixed layers and sharp inversions above terrain with large pointwise variations. Tha truncation arrors of tha prassura gradiant term are of special concern. This term is computed using a thermodynamic state carried as a deviation from a standard state. Turbulent mixing is based upon a simplified diagnostic treatment. The final model produces rather stable solutions because of the rather careful pressure gradient calculation and strong physical dissipation. (31 refs.)

69275 The monsoon over the Indian Ocean during summer 1975. II. Break and active monsoons. D.Cadet (Dept. of Meteorology, Florida State Univ., Tallahassee, FL, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.95-108 (Jan. 1983).
For pt.I see ibid., vol.109, p.148-58 (1981). Examines the active and break cycle of the monsoon during summer 1975. The time evolution of the flow over the Arabian Sea shows that three main accelerations of the circulation occurred during the 1975 monsoon. The circulation over the Arabian Sea responds more to the pressure difference between the Mascarene High and the monsoon trough than to pressure changes over central India alone. The intensity of the trade winds in the south Indian Ocean is also significantly positively correlated to the interhemispheric pressure gradient. The establishment of the strong circulation associated with the onset is followed with a lag of 2-3 days by a temperature drop [air temperature and sea surface temperature (SST)] of about 2°C. There is a significant positive correlation between the intensity of the wind over the Arabian Sea and monsoon activity over central India. Break conditions are associated with a weak interhemispheric pressure gradient, decrease of the wind intensity, and increase of SST over the Arabian Sea. During the 1975 summer monsoon, these variations of the monsoon activity related to the break and active cycles occur about every 30 days and affect a large part of the Indian Ocean. (25 refs.)

69276 Foreshadowing northeast monsoon rainfall over Tamil Nadu, India. O.N.Dhar, P.R.Rakhecha (Indian Inst. of Tropical Meteorology, Pune, India).
Mon. Weather Rev. (USA), vol.111, no.1, p.109-12 (Jan. 1983).
The association between the southwest and northeast monsoon (October-December) rainfall over Tamil Nadu has been examined for the 100-year period from 1877 to 1976. A correlation analysis between the two rainfall series revealed that the southwest monsoon (June-September) rainfall is negatively correlated with that of the northeast monsoon rainfall. That is, an excess of deficit of southwest monsoon rainfall over this region is generally followed by an opposite tendency in the northeast monsoon rainfall. A χ^2 test of dependence further indicated that the rainfalls in the two monsoons are not independent of each other. The negative rainfall relationship can be a useful tool in foreshadowing the northeast monsoon rainfall over Tamil Nadu, which is of considerable economic importance for this region. (3 refs.)

69277 Monsoon and teleconnection variability over Australasia during the Southern Hemisphere summers of 1973-77. R.J.Allan (Dept. of Geography, Univ. of Adelaide, Adelaide, Australia).
Mon. Weather Rev. (USA), vol.111, no.1, p.113-42 (Jan. 1983).
Interactions between monsoon and teleconnection circulations over the greater Australasian region 35°N-35°S, 85°E-175°E, are observed in 850 and 200 mb monthly mean velocity potential (χ) and streamfunction (ψ) fields during the peak of the Southern Hemisphere summers (January and February 1973-77) prior to the Winter Monsoon Experiment (WMONEX). Aspects of the spatial and temporal structure of the Australasian monsoon and teleconnection systems are presented through a closer examination of the January 1973-75 sub-period, using vertical cross sections of monthly mean divergence and monthly mean surface streamfunction (ψ_{sfc}) fields. Most importantly, this study suggests that large-scale Southern Oscillation/Walker Circulation (SO/WC) teleconnection patterns are associated with variations in components of the Asian monsoon system. Interannual and intraseasonal fluctuations in the Near Equatorial Troughs of the Northern (NET_{NH}) and Southern (NET_{SH}) Hemispheres appear to be related to large-scale atmospheric circulation changes. (70 refs.)

69278 Relationships among the stratospheric and tropospheric zonal flows and the Southern Oscillation. R.S.Quiroz (NOAA, Washington, DC, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.143-54 (Jan. 1983).
Relationships among the high-latitude stratospheric zonal wind, the tropospheric zonal wind in the region of the subtropical jet and over the equator, the Southern Oscillation, and the stratospheric tropical quasi-biennial oscilla-

tion (QBO) were examined from monthly anomaly data for 13 years (1968-80). Patterns of correlation were found which are broadly consistent with the theory on vertical and latitudinal Rossby wave propagation, with high correlations diminishing rapidly in association with easterly basic flow. Lag correlations as high as 0.8-0.9 were found for leads of ~1-7 months, based on three-month average anomalies for successive months. The simplified lead path is from Southern Oscillation to equatorial winds to subtropical winds to stratospheric high-latitude winds. Relationships involving the QBO appear weak compared with those involving the extratropical flows, the tropospheric equatorial flow of the east Pacific, and the Southern Oscillation. (30 refs.)

69279 Autocorrelation of Northern Hemisphere geopotential heights. D.S.Gutzler, K.C.Mo (Goddard Space Flight Center, NASA, Greenbelt, MD, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.155-64 (Jan. 1983).
Local autocorrelation statistics for the Northern Hemisphere geopotential height field are presented for different seasons and tropospheric pressure levels. The largest one-day lag autocorrelation values are observed over the polar regions and eastern oceans. Well-defined minima exist off the east coasts of Asia and North America. The minima are most distinct in winter, and are shifted northward and weaker during summer. Otherwise, the pattern does not change drastically with season. These geographical patterns do not change much with height, but the minima are less sharply defined at upper tropospheric levels. At longer lags, the extratropical maxima remain distinct, but the minima shift westward over the continents and cover a broader area, as the autocorrelation approaches zero with increasing lag. Values remain high over the tropics, where height anomalies tend to persist for many days. (13 refs.)

69280 The seasonal cycle over the United States and Mexico. V.E.Kousky, S.Srivatsangam (Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Inst. de Pesquisas Espaciais, Sao Paulo, Brazil).
Mon. Weather Rev. (USA), vol.111, no.1, p.165-71 (Jan. 1983).
The annual cycle occupies a unique position in the spectra of meteorological time series. This cycle and its first three harmonics are extracted from the series as a seasonal cycle. The distributions of the annual and seasonal cycles are studied for the United States and its immediate surroundings, using four years of data. The results show that the annual and seasonal cycles are extremely important contributors to the observed temperature and wind fields at the 850, 500 and 250 mb levels. In winter, the annual cycle establishes a west wind maximum in the subtropics, quite akin to the winter-average jet stream. The annual cycle in the horizontal wind constitutes a trough over the central parts of the United States in winter and a ridge in the same area in summer. (11 refs.)

69281 Variability of temperature in Wisconsin. W.A.R.Brinkmann (Dept. of Geography, Univ. of Wisconsin, Madison, WI, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.172-80 (Jan. 1983).
Daily maximum and minimum temperatures since 1897 at three stations in Wisconsin are examined, and the hypothesis is tested that there is no association between interdiurnal or interannual temperature and either the local mean temperature or an estimate of the hemispheric temperature. The hypothesis had to be accepted for interannual variability; it had to be rejected for interdiurnal variability. The association between interdiurnal variability and mean temperature is negative for winter and positive for summer, which is due to Wisconsin's location with respect to the general circulation patterns. (23 refs.)

69282 Two severe freezes in Brazil: precursors and synoptic evolution. M.A.Fortune, V.E.Kousky (Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Inst. de Pesquisas Espaciais, Sao Paulo, Brazil).
Mon. Weather Rev. (USA), vol.111, no.1, p.181-96 (Jan. 1983).
Two freezes struck Brazil in recent years, one during FGGE in 1979, the other in 1981. Data from multiple sources including satellites and drifting buoys were analyzed for early warning signs and synoptic evolution of the freeze events. Two important precursors were found: (1) a slowly moving low-wave pattern in the central South Pacific Ocean amplified greatly one to two days before frontogenesis in South America and four to five days before the freezes in Brazil; (2) the long-wave ridge, when at maximum amplitude, was located near the southern Andes, and the next long-wave trough downstream was located in the South Atlantic at the longitude of Brazil. This configuration channeled subantarctic air northward entirely over land into subtropical altitudes. (19 refs.)

69283 Surface signatures of a dry nocturnal gust front. R.W.Scott, B.Ackerman (Illinois State Water Survey, Champaign, IL, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.197-204 (Jan. 1983).
Sudden changes in surface meteorological parameters were observed to propagate across a densely-instrumented network in central Illinois during a summer night in 1979. The changes were due to the outflow from an eastward moving, organized storm system passing well north of the network. Although no precipitation was observed within 45 km of the area (i.e. its passage across the network was 'dry'), the change from ambient to outflow air was seen in other surface weather indicators nearly 100 km south of the point at which the outflow is estimated to have been initiated and more than 3 h after the generating storm had dissipated. (7 refs.)

69284 Numerical simulation of the airflow over Lake Michigan for a major lake-effect snow event. M.R.Hjelmfelt (Nat. Center for Atmospheric Res., Boulder, CO, USA), R.R.Braham,Jr..
Mon. Weather Rev. (USA), vol.111, no.1, p.205-19 (Jan. 1983).
A mesoscale model is used to simulate the airflow over Lake Michigan for the major lake-effect snowstorm of 10 December 1977. This storm was characterized by a land breeze circulation and a narrow shore-parallel radar reflectivity band. The model successfully simulated the major atmospheric circulation features including a mesoscale low pressure center and a land breeze front. The model also captured the general character of the observed precipitation pattern which was typified by a narrow band of heavy precipitation along the eastern shore of Lake Michigan. Further simulations were made to examine the effects of latent heat release, lake surface temperature distribution and model grid resolution upon the simulation. (17 refs.)

69285 A concentrated outbreak of tornadoes, downbursts and microbursts, and implications regarding vortex classification. G.S.Forbes (Dept. of Meteorology, Pennsylvania State Univ., University Park, PA, USA), R.M.Wakimoto.
Mon. Weather Rev. (USA), vol.111, no.1, p.220-35 (Jan. 1983).
A remarkable case of severe weather occurred near Springfield, Illinois, on 6 August 1977. Aerial and ground surveys revealed that 17 cyclonic vortices, an anticyclonic vortex, 10 downbursts and 19 microbursts occurred in a limited (20 km×40 km) area, associated with a bow-shaped radar echo. About half of the vortices appeared to have occurred along a gust front. Some of the others appear to have occurred within the circulation of a mesocyclone accompanying the bow echo, but these vortices seem to have developed specifically in response to localized boundary-layer vorticity generation associated with horizontal and vertical wind shears on the periphery of microbursts. Some of these vortices, and other destructive vortices in the literature, do not qualify as tornadoes as defined in the Glossary of Meteorology. A more pragmatic definition of a tornado is suggested. (73 refs.)

69286 Consistent balanced models in bounded and periodic domains. P.R.Gent, J.C.McWilliams (Nat. Center for Atmospheric Res., Boulder, CO, USA).
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.2, p.67-93 (March 1983).
An analysis is made of a family of balanced models which are intermediate in physical content and complexity between the primitive equations and quasigeostrophy. The family is based on the linear balance equations and balance equations, and is characterized by truncations of the full vorticity and divergence equations that retain a global energy invariant. Consistent initial boundary value problems for this family of models are derived, and various aspects of numerical balanced model design are discussed. (33 refs.)

69287 Rossby wave propagation in a barotropic atmosphere. D.J.Karoly (Australian Numerical Meteorology Res. Centre, Melbourne, Victoria, Australia).
Dyn. Atmos. & Oceans (Netherlands), vol.7, no.2, p.111-25 (March 1983).
The ideas of ray tracing from geometrical optics and wave propagation in a slowly varying medium are applied to Rossby waves propagating in a barotropic atmosphere. The propagation of low-frequency Rossby waves in a zonally symmetric base state is compared with that for stationary waves presented by Hoskins and Karoly (1981). These ideas are then used to study the propagation of Rossby waves in a basic state with zonally varying middle latitude or low latitude jets. Conditions which allow cross-equatorial wave propagation are presented. (13 refs.)

69288 On low-order non-linear stochastic-dynamic systems. A.Wiin-Nielsen (World Meteorological Organization, Geneve, Switzerland).
Tellus Ser. A (Sweden), vol.35A, no.1, p.1-16 (Jan. 1983).
A low-order system of equations derived from the advective equation with forcing and dissipation is investigated. A stochastic-dynamic treatment of these equations based on the closure assumption of the neglect of third and higher moments is carried out. For this system, the steady states, including those created by the closure assumption, are determined, and their linear stability properties are found. The asymptotic solutions in a stochastic-dynamic sense are determined without any closure assumption. It is shown that the three stable states for the system with closure form a subset of the continuum of asymptotic states for the system without closure. Several examples showing the differences between the asymptotic solutions of the two systems are calculated. (3 refs.)

69289 Linear non-divergent mass-wind laws on the sphere. R.Daley (Nat. Center for Atmospheric Res., Boulder, CO, USA).
Tellus Ser. A (Sweden), vol.35A, no.1, p.17-27 (Jan. 1983).
The properties of three types of linear non-divergent mass-wind laws on the sphere are examined: linear-balance equation, spherical harmonic expansions of the linearized primitive equations, and Rosby-Hough expansions. Both the symmetric and antisymmetric non-zonal cases are examined. The results show that all three methods are virtually equivalent for the antisymmetric case, but differ considerably for the symmetric case. All three methods, whether derived from the primitive equations or from a filtering approximation, appear to be singular at the equator in the symmetric case. (15 refs.)

69290 On the effect of model resolution on numerical simulation of blocking. S.Tibaldi, L.R.Ji (European Centre for Medium Range Weather Forecasts, Reading, England).
Tellus Ser. A (Sweden), vol.35A, no.1, p.28-38 (Jan. 1983).
A numerical case study of blocking is discussed briefly. The results indicate that model resolution seems to play a major role in the success of the simulation. It is argued that the effect of the initial conditions is somewhat less important than normally considered. The model used for all the experiments is the ECMWF spectral model. (12 refs.)

69291 The atmospheric energy budgets over North America, the North Atlantic and Europe based on ECMWF analyses and forecasts. H.Savijarvi (European Centre for Medium Range Weather Forecasts, Reading, England).
Tellus Ser. A (Sweden), vol.35A, no.1, p.39-59 (Jan. 1983).
The kinetic energy, sensible heat and latent heat budgets and the total energy balance of the Earth-atmosphere system are studied over North America, the North Atlantic and Europe. The data consist of 1 year (December 1979-November 1980) of ECMWF initialized objective grid point σ-coordinate analyses and the ensemble of forecasts for day 3. The results quantitatively confirm the thermally direct meridional circulation over North America with generation of kinetic energy and adiabatic heating in the troposphere; kinetic energy and sensible heat are exported out of the region. The opposite holds for the North Atlantic area. Budgets from the forecast data reproduce the main features present in the analysed data, but also indicate some defects in the parametrization of the sub-grid scale processes in the ECMWF model. (37 refs.)

69292 Statistical predictability and spectra of air temperature over the Northern Hemisphere. V.E.Privalsky (Water Problems Inst., Acad. of Sci., Moscow, USSR).
Tellus Ser. A (Sweden), vol.35A, no.1, p.51-9 (Jan. 1983).
Parametric models and statistical predictability of mean annual air temperature, both at individual stations (MAAT) and zonally averaged (MZAT), are evaluated. The time series have lengths from 125 to 315 years for MAAT and 86 years (1891-1976) for MZAT. The optimal parametric models of MAAT are shown to be closely approximated by a first-order Markov sequence with a small characteristic time scale, so that their statistical predictability is minimal. Variations in MZAT should be described with more complicated models; the limits of statistical predictability amount to between 4 and 5 years. The temperature spectra are estimated. (20 refs.)

69293 Some characteristics of chemical precipitation. A.W.Hogan (Atmospheric Sci. Res. Center, State Univ. of New York, Albany, NY, USA).
Tellus Ser. B (Sweden), vol.35B, no.2, p.121-30 (April 1983).
Two very dissimilar cold frontal occlusions deposited 6 mm and 60 mm of rain respectively at an observatory in the rural northeastern USA. Water precipitation was carefully observed, in conjunction with other meteorological parameters, through both storm systems. The concentration of several ionic substances were measured in specimens of rain water collected during meteorologically homogeneous portions of the two storms. The rate of chemical precipitation was determined with respect to water precipitation. (13 refs.)

69294 An investigation of the atmospheric HNO_3-NH_3-NH_4NO_3 equilibrium relationship in a cool, humid climate. R.M.Harrison, C.A.Pio (Dept. of Environmental Sci., Univ. of Lancaster, Lancaster, England).
Tellus Ser. B (Sweden), vol.35B, no.2, p.155-9 (April 1983).
Simultaneous measurements of gaseous nitric acid and ammonia were made during summer, autumn and winter months in North-West England. Concentrations of HNO_3 and NH_3 lay within the ranges 0.03-0.36 ppb and 0.9-5.1 ppb respectively, gaseous HNO_3 accounting for only about 12% of total

nitrate. Under the high humidity conditions prevalent during the work, the concentration data are consistent with the equilibrium of gaseous HNO_3 and NH_3 with solution droplets of NH_4NO_3. (18 refs.)

69295 Dynamics of singular geostrophical vortices in a two-level model of the atmosphere (ocean). V.M.Gryanik.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.227-40 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
The equations are obtained for singular geostrophical vortices interactions with each other and with a regular current. In the framework of a model the interaction peculiarities are analysed in a baroclinic atmosphere (or ocean) as well as in a baroclinic atmosphere-ocean system. The dynamics of two singular geostrophical vortices is considered for two cases: (i) without a regular current and (ii) in a current with zonal constant potential vortex. The influence of some non-adiabatic factors on vortices evolution is discussed. On the base of the model the analysis has been made of the relative motion of double tropical vortices. (23 refs.)

69296 Kinetic model of waterless fine-dispersed aerosol of the troposphere. G.V.Rozenberg.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.241-54 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
A model of kinetically caused parameters of the tropospherical fine-dispersed aerosol for stationary conditions is described. The model has two external parameters. (5 refs.)

69297 Numerical simulation of thermal influence on convective cloud development. A.S.Kabanov, A.Ye.Klykov.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.274-81 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
Numerical solutions of thermohydrodynamic equations with varying eddy coefficient have been used to study various structures of a convective cloud with conditionally stable stratification above a layer of thermal energy accumulation. More than sixty numerical experiments with different periods of appearance of thermals have been carried out. The life duration as well as the size of a cloud grow and its lower boundary rises under the influence of individual successive thermals. Water content distribution becomes bimodal with height and a clearance appears in a convective cloud. The experimental results have been compared with the observations. (14 refs.)

69298 Current progress and prospects in numerical techniques for weather prediction models. M.J.P.Cullen (Forecasting Res. Branch, Meteorological Office, Bracknell, England).
J. Comput. Phys. (USA), vol.50, no.1, p.1-37 (April 1983).
Progress in numerical weather prediction since about 1977 is reviewed. The development of larger and faster computers now allows a global forecast to be made in three minutes per day using a 150 km grid in the horizontal, 15 levels in the vertical, and one of the very efficient integration schemes now available. The forecasts produced are useful guidance to forecasters to about four days on average, but there is a large difference in performance from case to case. In this review developments in understanding the solutions to the governing equations are discussed, some of the efficient integration schemes are described in detail, and an example of the current standard of forecasts is displayed. (74 refs.)

69299 Explorative studies of meso- and micro-scale systems and lee waves over Qomolangma Feng (Mount Everest). Gao Dengyi, Liu Zengji, Yan Liangzheng (Inst. of Astropheric Phys., Acad. of Sinica, Beijing, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.12, p.1305-9 (Dec. 1982).
The existence of meso- and micro-scale systems at an elevation of 7500-9500 m during the exploration of Mt. Qomolangma in May 1975 was made known. And it seems, from the conditions they cause, that there is a relationship between the meso- and micro-scale systems and the lee waves. To study this relationship, investigations by free balloons were made on the north side of Mt. Qomolangma in April 1980. The conclusion shows that there are certainly strong lee waves there, corresponding to the atmospheric conditions caused by the meso- and micro-scale systems. (no refs.)

69300 Extreme value analysis in meteorology. R.C.Tabony (Meteorological Office, Bracknell, England).
Meteorol. Mag. (GB), vol.112, no.1329, p.77-98 (April 1983).
The theory of extreme values assumes that maxima (or minima) are drawn from infinitely large samples of independent observations belonging to a single population. Failure to satisfy the theory, therefore, can be due to using too small a sample or to the inclusion of observations from more than one population. It is demonstrated that in meteorology these reasons are often alternative expressions of the same problem, namely lack of data. A series of extremes may be regarded as belonging to the same population if a single forcing factor is responsible for the whole range of extremes encountered. This is seldom true of meteorological variables. It is shown that analyses of annual extremes are commonly to be preferred to those based on monthly data. When observed extremes fall well short of a physically imposed upper limit it is suggested that they can appear to be unbounded above. For short duration rainfall this can be interpreted as being due to changes in the organizational structure of convective storms from the lesser to the greater extremes. (17 refs.)

69301 Forecasting urban minimum temperatures from rural observations. J.Roodenburg (Royal Netherlands Meteorological Inst., de Bilt, Netherlands).
Meteorol. Mag. (GB), vol.112, no.1329, p.99-106 (April 1983).
A regression formula has been derived from which the nocturnal minimum temperatures in an urban area may be computed from meteorological variables observed at a nearby airport. (4 refs.)

69302 Turbulence with a spectral gap. A.Pouquet, U.Frisch (CNRS, Obs. de Nice, Nice, France), J.P.Chollet.
Phys. Fluids (USA), vol.26, no.4, p.877-80 (April 1983).
Under what conditions turbulent motions produced by two different mechanisms can coexist and have energy spectra separated by a gap, as often observed in astro- and geophysical flows, are investigated. The dynamical consistency of such a gap is illustrated using a two-point statistical closures and some experiments are suggested. (12 refs.)

69303 Measurement of daylight UVA in Glasgow. H.Moseley, M.Davison (Dept. of Clinical Phys. & Bio-Engng., West of Scotland Health Boards, Glasgow, Scotland), R.M.Mackie.
Phys. Med. & Biol. (GB), vol.28, no.5, p.589-7 (May 1983).
Measurements of daylight UVA have been carried out in Glasgow using a UVA-band detector and a spectroradiometer, both with the aperture window horizontal. Daily energy densities, defined as the total UVA energy each day per unit area, were obtained for the period November 1980 to May 1982. Levels rose from a mean December daily energy density of 4 J cm^{-2} to an average of 69 J cm^{-2} in June, with considerable fluctuations from day to day and with up to seven-fold changes observed on consecutive days. The UVA level sometimes varied rapidly during the day, with differences of up to a factor of six in successive 10 min periods. The daily temporal distribution of UVA for summer and winter, and the measured daylight spectra are presented. Measurements made by the spectroradiometer were compared with earlier published findings of solar UVA doses received by 56 patients who were photosensitised by 8-MOP in the course of PUVA therapy. It is shown that the median dose represented only 12 min daylight exposure and this indicates that the majority of patients do take care to avoid unnecessary exposure. However, the maximum dose was equivalent to some 84 min exposure to daylight UV and so there is clearly scope for a considerable reduction in exposure in some cases. (12 refs.)

69304 Latitudinal and vertical variation of thermodynamic instability over India as revealed by MONEX 1979. D.V.Viswanadham, M.R.Rameshkumar (Dept. of Marine Sci., Univ. of Cochin, Cochin, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, no.6, p.567-72 (Nov. 1982). [received: April 1983]
The static stability parameters σ_d and σ_m for dry air and moist air respectively which give a direct insight into the vertical variation of stability, have been computed, besides mixing ratio for select Indian stations situated in different latitude belts, by making use of the 2030 hr observations of MONEX 1979. The study revealed that the atmosphere up to 500 mb is convectively unstable in all latitude belts. The spatial variation of this stability revealed that the central parts are unstable. The middle layer (850-700 mb) is found to be highly unstable compared to other parts. An intercomparison for different months is made and discussed. (2 refs.)

69305 An estimate of the effect of the space-time coherence disturbances of the signal field on the effectiveness of optical communication lines in the atmosphere. Ye.R.Milyutin, Yu.I.Yaremenko.
Radio Eng. & Electron. Phys. (USA), vol.27, no.6, p.1-9 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR),* vol.27, no.6, p.1057-66 (June 1982). [received: May 1983]
It is well known that the state of the medium of propagation of theoretical radiation is the basic factor which determines the effectiveness of atmospheric optical communication lines (AOCL). Until the present time the effect of signal attenuation caused by various meteorological conditions on the AOCL performance has been investigated quite thoroughly, but such a statement is not quite true for the effect of space-time coherence disturbances of the signal field, caused by turbulence. The authors present a comparative analysis of the effectiveness of AOCL, which use different forms of modulation and different methods for reception of optical radiation, as a function of atmospheric turbulence parameters. (10 refs.)

69306 Dynamics of the middle atmosphere. M.A.Geller (Lab. for Planetary Atmosphere, NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Space Sci. Rev. (Netherlands), vol.34, no.4, p.359-75 (April 1982). [received: April 1983] (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
It is demonstrated by means of model calculations that while the general configuration of middle atmosphere dynamics (i.e. winter westerlies and summer easterlies) is determined by differenial solar heating, the deviations of the zonally-averaged temperature field from radiative equilibrium and the closure of the jet structures with increasing altitude results from the action of zonal mean momentum dissipation processes. The apparent heating and acceleration of the mean zonal state by planetary wave heat and momentum fluxes are examined using a Eulerian framework, and it is demonstrated that these are overestimates of their net effect. It is argued that since decelerations of the mean zonal flow are required in both winter and summer, and planetary waves are known to be very weak in the summer middle atmosphere, gravity waves are probably responsible for most of the middle atmosphere momentum dissipation as a result of their attenuation with height above their wave breaking altitude. (20 refs.)

69307 Circulation and waves in the middle atmosphere in winter. T.Matsuno (Geophys. Inst., Univ. of Tokyo, Tokyo, Japan).
Space Sci. Rev. (Netherlands), vol.34, no.4, p.387-96 (April 1982). [received: April 1983] (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
A few topics concerning the dynamics of the circulation and waves in the middle atmosphere are reviewed. The Lagrangian-mean descriptions of waves and wave-mean flow interactions developed in recent years give new views on the general circulation of the lower stratosphere and the mechanism of a sudden warming. In the former problem, the classical Brewer-Dobson circulation model is revived as the Langrangian-mean circulation which is directly connected with transports of long-lived trace species. In the latter problem, the easterly acceleration by planetary waves is understood in terms of the form drag through undulating material surfaces. This effect is nearly identical with the Eliassen-Palm flux, which is now used as a powerful tool to diagnose detailed mechanism of sudden warmings on individual event basis. Preliminary result of the author's numerical experiment to model sudden warmings caused by a variable planetary wave forcing in the troposphere is presented. (27 refs.)

69308 Influence of upper-level clouds on the thermal regime and circulation of the atmosphere. E.P.Borisenkov, V.P.Meleshko, A.P.Sokolov (Main Geophys. Obs., USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.1-10 (1981). Translation of: *Meteorol. & Gidrol. (USSR),* no.11, p.5-17 (1981).
The sensitivity of the Earth-atmosphere radiation balance to clouds at various levels is investigated. Numerical experiments are performed using a general atmospheric circulation model without upper-level clouds. Formation of clouds in an anticyclonic disturbance is reproduced. Variations governed by clouds and the thermal regime and circulation of the atmosphere are analyzed in detail. (23 refs.)

69309 Calculation of wind velocities in gusts in narrow cold-front zones. M.A.Masterskikh (Hydrometeorological Sci. Res. Center, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.76-8 (1981). Translation of: *Meteorol. & Gidrol. (USSR),* no.11, p.93-4 (1981).
The physical conditions that correspond to intensification of wind in narrow (up to 50 km) zones of cold fronts are examined. Formula are given for estimation of wind velocities in gusts in narrow frontal zones. (9 refs.)

69310 Dependency of tropospheric attenuation versus frequency and distance on radio relay links with optical sight. J.Kerhart, U.Kuhn, S.Ogulewicz.
Tech. Mitt. RFZ (Germany), vol.27, no.1, p.18-21 (March 1983). In German.
Within the framework of cooperation between the CSSR, the Polish People's Republic and the GDR, measurements of troposphere-dependent attenuation on radio relay links of differing length at the frequencies 3.5 GHz, 6 GHz and 11 GHz were made. Curves for tropospheric attenuation probability have been deduced. Deviations from CCIR data for 4 GHz over north-west Europe occur where greater distances are involved. (29 refs.)

69311 Atmospheric biopollutants of Gorakhpur. R.N.Tripathi, N.K.Dubey, S.N.Dixit (Dept. of Botany, Univ. of Gorakhpur, Gorakhpur, India).
Water, Air & Soil Pollut. (Netherlands), vol.19, no.3, p.215-21 (April 1983).
The present study on atmospheric biopollutants in the vicinity of Gorakhpur was carried out from July 1979 to June 1981 by exposing adhesive slides. Pollen grains, fungal spores and organic matters were found to be maximum amongst the traps. Plant parts (floral parts, hairs, pollens, tissue segments), algal parts; animal parts (danders, insects with pollen, insect eggs, legs, mouthparts, scales, spicules, wings) and identified and unidentified organic parts loaded with bacteria/fungi were found in the air throughout the year. Diurnal, monthly and seasonal variations in atmospheric biopollutants were studied quantitatively. The study of diurnal periodicity revealed maximum trapping of air-borne particles during morning and noon. The particles were maximum during the transition periods of the seasons (during mid October to mid November and March) and a minimum in June and August. The intensity of biopollutants increased with wind velocity and decreased with rainfall. (10 refs.)

69312 Wind tunnel simulation of the wind in an urban environment. K.W.Rutledge.
Report OUEL-1414/82, Univ. Oxford, England (July 1982), 20 pp.
Describes a part-depth simulation of an urban flow ($Z_0=1.0$ m) developed by the Wind Engineering Research Group in the Oxford University 4 m×2 m industrial aerodynamics tunnel. The velocity characteristics of the resulting simulation are investigated. (6 refs.)

69313 Cloud classification on multispectral images taken from meteorological satellites. G.Seze, M.Desbois, S.Senesi (Ecole Polytech., Palaiseau, France).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.87-92 vol.1 In French.
The dynamic cloud cluster method is applied to the spectral representation of image segments from meteorological satellites (which are furnishing pictures at 2, 3 or N wavelengths). In the case of METEOSAT, the resulting classifications are meteorologically significant, for mesoscales as well as for large scale. In this last case, the method can be applied to provide initial cloudiness parameters for an atmospheric general circulation model. (no refs.)

69314 Some tropospheric factors affecting the reliability of microwave LOS links over Northern India. S.K.Sarkar, H.N.Dutta, B.M.Reddy (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.294-7 part 2
Discusses how the predominance of any particular microwave propagation mode depends upon the radio frequency; the path geometry and the structure of radio-refractive index fluctuation of the medium and the propagation characteristics are determined by the dominant mechanism of propagation. According to homogeneous turbulence theory, field strength relative to free space is characterised by $\lambda^{-1/3}$ law. The dual frequency field strength measurements gives more information about propagation mechanisms compared to a single frequency experiment. When the mechanism of propagation is known and association of refractive index fluctuations and wind velocity component along the propagation path are determined, it is possible to interpret the characteristics of fading patterns from the knowledge of meteorological elements. (12 refs.)

69315 Accurate modeling of instantaneous solar radiation. C.K.Alexander, R.Z.Makki, R.E.Ohlin (Tennessee Technol. Univ., Cookeville, TN, USA).
IEEE SOUTHEASTCON '83 Conference Proceedings, Orlando, FL, USA, 11-14 April 1983 (New York, USA: IEEE 1983), p.448-52
Presents a simulation model that predicts average instantaneous solar radiation for different localities around the United States. The method differs from previous techniques in that it offers a peaking model rather than just average values. Based upon the results of the simulation, the authors present relationships leading to significant modifications of Laue's curves. The computer simulation presented can be used for any location around the world where monthly average total radiation and hours of sunshine data are available. (5 refs.)

69316 Fluctuations in the drought/flood area over India and relationships with the Southern Oscillation. H.N.Bhalme, D.A.Mooley, S.K.Jadhav (Indian Inst. of Tropical Meteorology, Pune, India).
Mon. Weather Rev. (USA), vol.111, no.1, p.86-94 (Jan. 1983).
An objective numerical drought/flood index has been used to obtain, on the dryness side, the Drought Area Index (DAI) and on the wetness side, the Flood Area Index (FAI) for India for the period 1891-1979. The DAI for a given year is the percentage area of India corresponding to a mean monsoon index with drought intensity ≤ -2 (moderate drought or worse). Likewise, on the wetness side, the Flood Area Index (FAI) for the given year is the percentage area of India corresponding to a mean monsoon index with flood intensity $\geq +2$ (moderate flood or worse), where the mean monsoon index of an area is the mean drought/flood index for the four monsoon months (June-September). A year with $DAI/FAI \geq 25$, i.e. 25% of the country area, is identified as a large-scale drought/flood year, respectively. The magnitude 25 used in identifying large-scale drought/flood corresponds approximately to twice the standard deviation of the DAI/FAI series. The large-scale April Pressure Index (PI) of the Southern Oscillation has been devised with the combination of surface pressure of stations from Australia, India, Indonesia and South America. The fluctuations of PI covering a period of 89 years (1891-1979) and its relation to the DAI and FAI have been examined. (30 refs.)

69317 An atmospheric $^{13}C/^{12}C$ reconstruction generated through removal of climate effects from tree-ring $^{13}C/^{12}C$ measurements. S.W.Leavitt, A.Long (Dept. of Geosci., Univ, of Arizona, Tucson, AZ, USA).
Tellus Ser. B (Sweden), vol.35B, no.2, p.92-102 (April 1983).
An accurate reconstruction of past $^{13}C/^{12}C$ ratios of atmospheric CO_2 may provide key constraints on the historical activity of the biosphere as CO_2 source or sink. Tree rings appear to be a repository of this information but there is much noise in the collection of previous reconstructions, presumably associated with site selection, radial variability, choice of representative wood chemical constituent, and subtle effects of climate on fractionation. The authors attempt to avoid these pitfalls and develop a 50-yr $\delta^{13}C_{ATM}$ record from juniper trees (genus Juniperus), in fact, by taking advantage of the influence of climate on fractionation. Trees were harvested from suitable sites in close proximity to weather stations with monthly records of temperature and precipitation, and ring material was separated from the sections in 5-year intervals around their full circumference. From each interval, relationships of $\delta^{13}C$ of the cellulose fraction with mean December temperature or precipitation of the respective sites emerged, showing nearly constant slopes from one interval to the next but with different intercepts. The separation of these regression lines of different intervals is interpreted as the response of the trees to the changing $\delta^{13}C$ of atmospheric CO_2 so that $\delta^{13}C_{ATM}$ curves are constructed from this spacing. (41 refs.)

69318 Dendroclimatological techniques in the study of climate history. A.Kh.Khrgian (Moscow State Univ., Moscow, USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.11-20 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.18-29 (1981).
Discusses certain examples in which climatic events and climate changes in the past influenced annual tree growth. Radiation, temperature, and rainfall variations have noticeable though lagging effects of the increments. Interpretation of dendroclimatic observations may be aided by results of modern instrumental observations and historical accounts. (12 refs.)

69319 An empirical analysis of the influence of CO_2 on contemporary variations in annual average surface air temperature in the Northern Hemisphere. K.Ya.Vinnikov, P.Ya.Groisman (State Hydrological Inst., USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.21-33 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.30-42 (1981).
Presents a nonstationary model of the Northern Hemisphere energy balance that takes account of the thermal lag of the climatic system, albedo variations due to variations of atmospheric transparency, (turbidity), the influence of CO_2 concentration on the longwave outgoing radiation, and feedback between albedo and temperature. The model is used to study variations of the global hemispheric thermal regime from 1883 through 1977. Estimates for the sensitivity of the global surface temperature regime to doubling of CO_2 content in the atmosphere vary from 2 to 3°C, in satisfactory agreement with the most reliable theoretical estimates. (see also 42.00 Optics)

69320 Overlapping effect of atmospheric H_2O, CO_2 and O_3 on the CO_2 radiative effect. Wei-chyung Wang, P.B.Ryan (Atmospheric and Environmental Res. Inc., Cambridge, MA, USA).
Tellus Ser. B (Sweden), vol.35B, no.2, p.81-91 (April 1983).
The effect of overlapping of atmospheric H_2O, CO_2 and O_3 absorption bands on the radiation budget perturbation caused by CO_2 doubling is investigated.

Since the effect depends on the amount of gases in the atmosphere as well as on the strength of the absorption bands, the authors examine the effect associated with the variation of gas abundance using a narrow band representation for the absorption bands. This band representation allows for the absorption band structure and thus accounts for the correlation of the spectral feature of the absorbing gases. (40 refs.)

69321 Atmospheric turbidity over Africa—disturbed by the El Chichon eruption?. R.Jaenicke, G.A.d'Almeida (Inst. fur Meteorologie, Univ. of Mainz, Mainz, Germany).
Geophys. Res. Lett. (USA), vol.10, no.3, p.233-5 (March 1983).
In a network, the atmospheric turbidity over Africa is observed for two years. The most recent data from a central Sahara station show increased values but horizontal visibility remained unchanged. This large turbidity seems to be produced not only regionally, rather the temporal development points toward the eruption of El Chichon in Mexico. (11 refs.)

69322 Extinction and scattering of infrared radiation by polydisperse systems of ice plates and cylinders. A.G.Petrushin.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.267-73 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
The extinction, absorption, scattering efficiencies and single albedo are obtained for polydisperse systems of plates and cylinders. The influence of ice particle shape, size, orientation as well as the direction of incident radiation propagation relative to the plane of orientation on these characteristics is studied. The values of extinction, scattering and absorption efficiencies are shown to vary not more than by factor of 2-2.5 at the orientation of ice cylinders and plates as the direction of incident radiation propagation changes relatively to the given plane, whereas the value of single albedo changes by factor of 0.2-0.3. (21 refs.)

69323 Image processing adapted to the atmosphere speckle. I. Speckle formation in turbulent atmosphere. Statistical properties. J.Vernin, M.Azouit (Dept. d'Astrophys., Univ. de Nice, Nice, France).
J. Opt. (France), vol.14, no.1, p.5-9 (Jan.-Feb. 1983).
Reviews the theory of the production of speckle by the diffraction of light waves through turbulent layers seen as phase screens. Different atmospheric situations allow the authors to show the influence of the distance between the diffuser and the observer on the speckle geometry. The small perturbation approximation is experimentally justified and it is shown that the speckle pattern is still contrasted even with broadband photoelectric receivers. Image processing by means of spatiotemporal analysis of a single or multiple star could give one a variety of geophysical information. (11 refs.)

69324 Spatio-temporal study of the point spread function of the terrestrial atmosphere by solar limb observation. P.Druesne (Lab. d'Electricite, Univ. de Pau et des Pays de l'Adour, Pau, France), J.Borgnino, C.Aime, R.Petrov, S.Kadiri.
J. Opt. (France), vol.14, no.1, p.11-17 (Jan.-Feb. 1983). In French.
By solar limb observation the temporal variations of image motion and blurring are studied. Measurements of typical time constants of these parameters are deduced and the results are found in agreement with the lower values obtained by other observers. Comparison with theory leads to the estimation of Fried's parameter r_0 (see J. Opt. Soc. Amer., vol.56, p.1372, 1966). (13 refs.)

69325 Chemical elemental composition of wind-blown dust, April 19, 1980, Beijing. Wang Mingxing (Inst. of Atmospheric Phys., Acad. Sinica, Beijing, China), J.W.Winchester, T.A.Cahill, R.Lixin.
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1193-8 (Nov. 1982). [received: April 1983]
World interest in the long-range transport of dust from dry areas of China to the Pacific and Arctic oceans as well as the possible importance of surface dust as a factor in air quality of North China justifies the investigation of the chemical composition of soil dust in China during periods of dust storm activity. In this paper the first measurements of North China dust composition as a function of particle size for the principal earth crustal elements are reported. The results are evaluated from the standpoints of the constancy of this composition over time and with particle size, effects of sampler inlet design on coarse particle dust concentrations, and the concentrations in various particle size ranges during high-wind conditions as compared with normal quiet air conditions in North China. (12 refs.)

69326 Calculations of the intensity of a partially coherent optical beam in a turbulent atmosphere. V.A.Loginov, V.V.Slonov.
Sov. J. Quantum Electron. (USA), vol.12, no.11, p.1443-6 (Nov. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.11, p.2221-5 (Nov. 1982). [received: May 1983]
An investigation of the main energy characteristics of the field of a partially coherent optical beam propagating in a turbulent atmosphere: the beam intensity on the axis and the beam width. It is found that these characteristics depend on the degree of initial spatial coherence of the beam, the turbulent distortions, and the wave parameter. Numerical calculations are made of the spatial distribution of the beam intensity and simple empirical relationships are derived and discussed. (7 refs.)

69327 Certain problems of seeing through clouds and fogs. A.S.Drofa, I.L.Katsev (Inst. of Experimental Meteorology, Acad. of Sci., USSR).
Sov. Meteorol. & Hydrol. (USA), no.11, p.85-95 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.11, p.101-9 (1981).
Theoretical and experimental studies of the visibility of objects through clouds and fogs are reviewed. Relationships are presented for estimation of the optical transfer function of a cloud medium and the signal/noise ratio in the image of an object observed through the medium. The manner in which these characteristics are affected by the light-scattering properties of the cloud medium and their distributions along the line of sight are discussed. (48 refs.)

69328 An analytical model to calculate the atmospheric correction on infrared thermal signals. P.G.Berardi (Istituto di Aerodinamica, Univ. di Napoli, Napoli, Italy).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.329-34 vol.1
Determines the radiative field in the atmosphere with its upwelling, and downwelling components for an absorbing and emitting medium. The atmospheres behaviour in the infrared spectrum is modelled by means of Bignell's formula. The radiative field is obtained in closed form. It is possible, for a given atmosphere, to define an equivalent atmospheric temperature (T_e^a), dependent on the altitude, which allows one to compute the monochromatic intensity with the classical isothermal model. The bounding values of the function T_e^a define three different surface temperature intervals with regards to the atmospheric correction. The model is tested by using meteorological data. (6 refs.)

92.90 OTHER TOPICS IN HYDROSPHERIC AND ATMOSPHERIC GEOPHYSICS

69329 Investigation of remote sensing possibilities of the lower atmosphere in the microwave range and some aspects of statistical data use. K.P.Gaikovich, N.N.Markina, A.P.Naumov, V.M.Plechkov, M.I.Sumin (Radiophys. Res. Inst., Gorky, USSR).
Int. J. Remote Sens. (GB), vol.4, no.2, p.419-31 (April-June 1983).
An integral relation is obtained between variations of the brightness temperature for ground-based microwave radiometry and meteorological parameters of the atmosphere which permits a general approach to the statement of inverse problems of thermal and humidity sensing in the microwave range. Statistical estimations of accuracy for recovering low-altitude temperature and humidity profiles are given. Using the example of ammonia pollution of the atmosphere possibilities are illustrated of remote-sensing methods for the definition of constituents of an industrial origin. Problems are considered for the use of remote-sensing data in real-time monitoring of the astronomical refraction and the electrical path length of the atmosphere in the radio range. (41 refs.)

69330 The paleogeography of Paleozoic and Mesozoic storm depositional systems. K.M.Marsaglia, G.Devries Klein (Dept. of Geology, Univ. of Illinois, Urbana, IL, USA).
J. Geol. (USA), vol.91, no.2, p.117-42 (March 1983).
Present-day hurricane belts are confined to 5°-45° latitude along the western edges of oceans, whereas winter storms occur ubiquitously above 25° latitude. Both hurricanes and winter storms occur between 25° and 45° latitude in some areas. Storm zones can be identified on global paleogeographic maps with the assumption that this latitudinal zonation of storm systems existed in the geological past. Evaluation of 69 previously-recognized Paleozoic and Mesozoic storm depositional systems on such maps shows that only 70% of them occur in ancient hurricane, mixed hurricane and winter storm, and winter storm belts. The remainder occur on the western sides of continents and/or at low paleolatitudes, and therefore well may be of different origin. Mesozoic storm depositional systems containing hummocky stratification tend to occur in counterpart paleo-winter storm belts, whereas hummocky stratification in suggested Paleozoic examples occur in both winter storm and hurricane belts and in paleolatitudes where the authors infer storm activity did not occur. (134 refs.)

69331 Landsat-data for distributed hydrological models. L.Gottschalk, I.Krasovskaia (Dept. of Hydrology, Univ. of Uppsala, Uppsala, Sweden), J.J.Talts.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.407-12 vol.1
The most widely used models in hydrology today are lumped models, but they do not answer sufficiently to the present needs of hydrological information for water resources planning. When model parameters are determined from hydrological and climatological observations with the help of statistical methods, the choice of basin is governed by the pattern of the observation network and not by the needs of a specific water planning problem. Landsat-data are used to make a classification of the basin of one of the largest lakes in Sweden. Landsat-data are then transformed to the map grid system and the two data sets are used together in a maximum-likelihood classification into 34 categories representing water, built up areas, forest, bogs and arable land. The demands of new types of spatial data are discussed as well as methods of data acquisition with examples from a hydrological project in Sweden. (5 refs.)

69332 An operational program for monitoring surface temperatures of lakes and coastal-zone waters in Canada from polar-orbiting satellite infrared data. G.J.Irbe, A.Saulesleja (Atmospheric Environment Service, Downsview, Ontario, Canada).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.717-24 vol.1
Surface temperatures of the Laurentian Great Lakes and Nova Scotia coastal waters in Canada are monitored regularly using infrared radiances in the 10.5-11.5 μm region detected by sensors on board NOAA polar-orbiting satellites. Temperatures are corrected for atmospheric attenuation by radiative transfer calculations, using the Low Resolution Transmission (LOWTRAN) model of Selby et al. (1976), and local radiosonde data for water vapour distribution in the atmosphere. The satellite-derived temperatures have been found to have a root-mean-square difference of 0.6°C from temperatures measured at buoys. The performance of the method under diverse atmospheric conditions is investigated in the course of operational temperature monitoring. (8 refs.)

69333 Water depth mapping from passive remote sensing data under a generalized ratio assumption. J.M.Paredes, R.E.Spero (W.W. Gaertner Research Inc., Stamford, CT, USA).
Appl. Opt. (USA), vol.22, no.8, p.1134-5 (15 April 1983).
Estimating water depth on the basis of measurements taken in a single spectral band can be unreliable due to the confounding effect of variation in bottom type. This can be partially corrected for by including more than one band in the process. Depth processing is based on a reflectance model and if bands exist such that the ratio of the bottom reflectances is the same for all points in the scene, an equation giving depth which is independent of bottom type can be produced. Thus, a generalized version of the assumption that a pair of bands exists such that the ratio of the bottom reflectances in these two bands is the same for all bottom types in the scene is that there exists a pair of band and constants c_1, c_2 such that $(r_{A1})^{c1}(r_{A2})^{c2}=(r_{B1})^{c1}(r_{B2})^{c2}=...=\alpha$ holds for all bottom types in the scene. The authors see how this assumption makes it possible to derive an equation giving depth as a function of light intensity which is valid for all bottom types. Then, the authors take a closer look at the assumption to give a simple condition in which it must hold. (5 refs.)

69334 Electron microscopy of minerals. P.R.Buseck (Dept. of Geology, Arizona State Univ., Tempe, AZ, USA).
Am. Sci. (USA), vol.71, no.2, p.175-85 (March-April 1983).
Transmission electron microscopy allows one to see details of crystals at close to the atomic level, increasing the understanding of the chemical and physical properties of minerals. The author first of all describes the high-resolution transmission electron microscopy method and then provides examples of the new knowledge gained by use of this method. TEM images of asbestos (chrysotile), clay, mica and pyrrhotite are presented. (41 refs.)

69335 Some scientific objectives of a satellite-borne lightning mapper. M.H.Davis (Univ. Space Res. Assoc., Boulder, CO, USA), M.Brook, H.Christian, B.G.Heikes, R.E.Orville, C.G.Park, R.G.Roble, B.Vonnegut.
Bull. Am. Meteorol. Soc. (USA), vol.64, no.2, p.114-19 (Feb. 1983).
The Lightning Mapper Sensor is proposed as an instrument for use on a geosynchronous satellite in the late 1980s to monitor lightning activity continuously over broad areas of the Earth. The system was suggested in response to a variety of needs and the resulting data will provide important research information for such fields of geoscience as magnetospheric and ionospheric physics, atmospheric electricity, atmospheric chemistry, and storm physics. The research applications of Lightning Mapper Sensor data and related research programs are explored and sensor requirements are discussed. (12 refs.)

69336 Using midday surface temperature to estimate daily evaporation from satellite thermal IR data. B.Seguin (Station de Bioclimatologie, INRA, Montfavet, France), B.Itier.
Int. J. Remote Sens. (GB), vol.4, no.2, p.371-83 (April-June 1983).
The practical experience obtained by participation in the European project TELLUS (a part of the HCMM programme) led the authors to state that the thermal inertia concept and sophisticated models are useful for understanding basic processes and for performing informative simulations, but cannot be used for a real estimation of evaporation. On the other hand, a simplified procedure like that proposed by Jackson et al. (1977) appears feasible, but its theoretical basis and its field of application are subject to discussion. Two main questions arise, namely, the conditions underlying the use of one instantaneous measurement to estimate daily integrated values, and the significance of the adjustment parameter B in the simplified relationship $ET_d=Rn_d-B(Ts-Ta)_i$ which relates the daily evaporation to daily net radiation by means of one measurement of the surface and air temperature at a given time of day. These questions are discussed with reference to results of recent experiments. (24 refs.)

69337 Measurement of wind across a microwave line-of-sight propagation path. G.D'Auria, D.Solimini (Istituto di Elettronica, Univ. di Roma, Rome, Italy).
Int. J. Remote Sens. (GB), vol.4, no.2, p.385-98 (April-June 1983).
Methods of measuring wind across a microwave propagation path are examined and specific problems involved are discussed. Both the initial slope and the time-delay method are considered and the use of a filter in the time domain for changing the shape of the weighting functions is examined. An experiment that has been carried out at X-band along a 37 km propagation path over hilly terrain is described. In this experiment emphasis has been given to straightforward procedures for inferring the wind across the path by making use of simple wind models valid for some kind of air circulation. A comparison of the results with data obtained from conventional wind measurements is reported. (13 refs.)

69338 An approximate procedure to isolate single scattering contribution to lidar returns from fogs. P.Bruscaglioni, G.Zaccanti (Istituto di Fisica Superiore, Univ. di Firenze, Firenze, Italy), L.Pantani, L.Stefanutti.
Int. J. Remote Sens. (GB), vol.4, no.2, p.399-417 (April-June 1983).
Lidar signatures from fogs can be affected by a substantial contribution from multiple scattering. This latter is strongly dependent on the aperture α of the receiver's field of view. Since lidar IROE IV allows the use of different values of α, an analysis is made of an approximate procedure to process the data in order to extract the single scattering contribution to the received power. Some experimental results are presented. (7 refs.)

69339 The design of optimum remote-sensing instruments. G.F.Peckham (Heriot-Watt Univ., Edinburgh, Scotland), D.A.Flower.
Int. J. Remote Sens. (GB), vol.4, no.2, p.457-63 (April-June 1983).
Remote-sensing instruments allow values for certain properties of a target to be retrieved from measurements of radiation emitted, reflected or transmitted by the target. The retrieval accuracy is affected by random variations in the many target properties which affect the measurements. The authors describe how statistical properties of the target and theoretical models of its electromagnetic behaviour can be used to choose values for the instrument parameters which maximise the retrieval accuracy. The technique is applicable to a wide range of remote-sensing instruments. (14 refs.)

69340 Optimising a remote sensing instrument to measure atmospheric surface pressure. G.E.Peckham, C.Gatley (Heriot-Watt Univ., Edinburgh, Scotland), D.A.Flower.
Int. J. Remote Sens. (GB), vol.4, no.2, p.465-78 (April-June 1983).
Atmospheric surface pressure can be remotely sensed from a satellite by an active instrument which measures return echoes from the ocean at frequencies near the 60 GHz oxygen absorption band. The authors optimise the instrument by selecting its frequencies of operation, transmitter powers and antenna size through a new procedure based on numerical simulation which maximises the retrieval accuracy. The predicted standard deviation error in the retrieved surface pressure is 1 mb. In addition the measurements can be used to retrieve water vapour, cloud liquid water and sea state, which is related to wind speed. (26 refs.)

69341 Seismic contact transducer. A.V.Rykov.
Seism. Instrum. (USA), p.1-4. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.3-6 (1980).
Describes a seismic parametric displacement sensor which measures the electrical conductivity of contacts of two conductors that changes jumpwise 0 to ∞. One contact is attached to the pendulum and the other, to the seismometer. Displacement and velocity feedback circuits are used to get the pendulum into high frequency, low-amplitude oscillations that cause closing and opening of the contacts, resulting in pulse duration modulation of the pendulum displacements. The acceleration sensitivity of the transducer model without electronic amplification varies within the range 0.1-10 V/gal. (4 refs.)

69342 STKS symmetric three-component electrodynamic seismometer. G.L.Shnirman.
Seism. Instrum. (USA), p.5-10. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.7-13 (1980).
Describes the STKS symmetric, three-component, electrodynamic field seismometer designed and developed at the Institute of Physics of the Earth of the Soviet Academy of Sciences. The seismometer is intended for long-duration operation under field conditions. (5 refs.)

69343 Multichannel seismographs with galvanometric recording. A.G.Mysh.
Seism. Instrum. (USA), p.11-17. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.13-20 (1980).
Transfer functions and the frequency response of seismometers with n degrees of freedom, equipped with a single transducer but having different configurations are derived and analyzed. (8 refs.)

69344 N-052 engineering-seismic system. Yu.M.Kuchinskii, Yu.M.Sil'yanov, A.A.Fridman.
Seism. Instrum. (USA), p.18-28. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.20-34 (1980).
A 14-channel FM magnetic recording system equipped with a magnetic drum delay memory is described. The system is intended for registration of local and near earthquakes and can be used under stationary and field conditions. (no refs.)

69345 Magnetic drum recorder of seismic blast waves. Yu.B.Dvoeglazov, V.M.Sergeev.
Seism. Instrum. (USA), p.37-43. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.42-9 (1980).
Describes a magnetic drum recorder of seismic blast waves. The principal design parameters of the magnetic drum and the aerodynamic magnetic head mount are calculated. Requirements imposed on the electronics of the recorder are formulated. (2 refs.)

69346 Digital-to-analog converter unit. G.S.Grebenchuk.
Seism. Instrum. (USA), p.49-50. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.55-6 (1980).
Describes a digital-to-analog (frequency) converter developed in conjunction with other equipment for registration of parallel-coded signals on a single track of a magnetic tape. This is achieved by means of narrow-band frequency manipulation (modulation) and recording in frequency separated, record-playback channels. Seismic applications are considered. (2 refs.)

69347 Dynamic memory systems of geophysical equipment. G.S.Grebenchuk.
Seism. Instrum. (USA), p.51-3. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.57-9 (1980).
Deals with problems encountered in using operational memory devices in geophysical recording equipment. Various types of signal storage and delay lines are considered. The design of a dynamic memory system consisting of a shift register is described and its characteristics are given. (4 refs.)

69348 A device for converting analog records of autonomous ocean-bottom seismograph systems into digital form and recording on a digital tape recorder in ES computer format. A.M.Bodyagin, V.P.Karman, B.Ya.Karp, V.E.Smolin, A.V.Sudakov, R.P.Chaptsov.
Seism. Instrum. (USA), p.54-6. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.60-3 (1980).
A device is described for converting analog signals into digital ES computer format adapted to peculiarities of analog data recording of autonomous ocean-bottom seismograph systems. The device records signals from three signal channels of ocean-botton seismographs at two gain levels with a dynamic range of 60 dB. Digitizing rate is determined by the repetition rate of synchronous pulses recorded on the tape recorder of the ocean-bottom seismograph. This makes it possible to decrease the error associated with tape speed nonuniformities during recording and playback. (no refs.)

69349 Use of materials based on antimony sulfoiodide in piezoelectric seismometers. G.K.Arakelyan, V.A.Lyakhovitskaya, V.D.Spitsina, V.M.Fremd.
Seism. Instrum. (USA), p.57-60. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.63-7 (1980).
The results of experimental measurements of the principal electrophysical parameters of crystalline piezoelectric materials based on SbSI are considered. High values of bulk piezoelectric modulus and fairly low values of transverse piezoelectric moduli make it possible to develop small piezoelectric seismometers made of these materials with almost zero transverse sensitivity. Several characteristics of materials based on SbSI, promising for use in piezoelectric seismometers are discussed. (3 refs.)

69350 Methods and certain results of tests of SSRZ-M accelerographs. D.P.Kirnos, V.I.Davydov, M.V.Zabelin, A.I.Levin, A.E.Manokhin, S.M.Potapov.
Seism. Instrum. (USA), p.61-71. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.67-78 (1980).
Describes methods of determining the principal operating parameters of the SSRZ-M accelographs (sensitivity, natural frequency, damping constant, trigger level of the starter, timing marks) and its characteristics (linearity and transverse sensitivity). The principal results of tests of the accelerograph are given. (3 refs.)

69351 A technique of increasing reliability of transient (pulse) calibration of complex seismographs. Z.I.Aranovich, A.Ya.Melamud, E.S.Gomzyakova, A.Plesinger, I.Khoralek.
Seism. Instrum. (USA), p.93-6. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.100-3 (1980).
A technique of decreasing the number of parameters determined by the least squares method is utilized in order to increase the reliability of transient calibration of complex seismographs. The parameters obtained in this manner are used to calculate the sensitivity curve throughout the whole required range of periods with an accuracy sufficient for practical applications. (3 refs.)

69352 Choice of parameters of seismographs for registration of distant earthquakes. Z.I.Aranovich, N.L.Trapeznikov.
Seism. Instrum. (USA), p.102-6. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.108-12 (1980).
The dependence of amplitudes and periods of seismic phases on the magnitude and the epicentral distance is established. This makes it easy to select the required parameters of seismographs (sensitivity, dynamic range, magnification curve). Several variants of sets of seismographs that will record teleseismic earthquakes of magnitude $M \geq 4$ are considered. (9 refs.)

69353 Simple high-sensitivity short-period electronic velocity seismograph. N.L.Trapeznikov.
Seism. Instrum. (USA), p.107-8. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.114-15 (1980).
An electronic seismograph is described that is constructed using mass produced components. The seismograph can be used with any type of recording system, including digital recorders. Parameters are given and the components are described. (2 refs.)

69354 A floating point formatter for digitally recording seismic systems. S.A.Negrebetskii, I.M.Turetskii.
Seism. Instrum. (USA), p.115-18. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.122-6 (1980).
A universal floating point formatter for seismic data acquisition systems has been developed. The device converts input signals with amplitudes ranging over 12 dB into an analog mantissa of a number for input into a 10-bit analog-to-digital converter and into a two bit exponent. Only integrated circuits are used in the formatter. The design of the formatter makes possible its wide use in various geophysical recording systems. (6 refs.)

69355 Digital magnetic narrow-band frequency-manipulated and summed (NFMAS) recording of strong earthquakes. G.S.Grebenchuk.
Seism. Instrum. (USA), p.119-28. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.126-37 (1980).
Describes a method of digital magnetic recording of strong earthquakes by means of narrow-band frequency manipulation and summation of multi-byte information. This method makes it possible to use one track of a magnetic tape for frequency-separated digital record-playback channels. Certain theoretical problems of choosing parameters of digital recording are considered and a strong motion seismograph designed on this principle is described. A dynamic type, digital delay line that makes it possible to utilize standby operation modes for registration of strong earthquakes is also described. (7 refs.)

69356 Equipment for regional seismic investigations. Yu.V.Brulev, G.G.Krylov, I.L.Nersesov, V.I.Raizman, G.A.Sychev, V.F.Totmenin.
Seism. Instrum. (USA), p.129-41. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.138-53 (1980).
Describes equipment for regional seismic investigations consisting of a three-component short-period seismometer; a field magnetic recording system and a radiotelemetry system for seismic data transmission. (2 refs.)

69357 Two operating modes of a piezoelectric accelerometer. G.K.Arakelyan, B.G.Uspenskii.
Seism. Instrum. (USA), p.142-4. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.154-6 (1980).
A piezoelectric accelerometer operating in a no-load mode is considered. A formula is derived for the sensitivity of a piezoelectric accelerometer operating in a short-circuit integrating mode. Recommendations are given on the choice of the operating mode of a piezoelectric accelerometer in an industrial seismic warning system. (6 refs.)

69358 Electronic time mark generator for light-beam oscillographs [seismic applications]. I.M.Rozenberg.
Seism. Instrum. (USA), p.145-6. Translation of: *Seism. Prib. Instrum. Sredstva Seism. Nabl. (USSR)*, vol.13, p.156-7 (1980).
An electronic, 10 Hz time mark generator constructed using integrated circuits is described. The AC power grid is used as the source of the reference frequency. (2 refs.)

69359 An accuracy goal for a comprehensive satellite wind measuring system. N.A.Phillips (Nat. Meteorological Center, NOAA, Washington, DC, USA).
Mon. Weather Rev. (USA), vol.111, no.1, p.237-9 (Jan. 1983).
Variational analysis with a geostrophic constraint is used to estimate a critical accuracy for a satellite lidar wind measuring system. This accuracy is such that the combination of satellite winds with satellite temperatures can produce analyses with an accuracy equal to that obtained from a rawinsonde network. An important assumption allowing this estimate to be made is that the satellite wind and temperature measurements are made with a spatial density equal to that of the rawinsonde network. (8 refs.)

69360 Laboratory calibration of the Photon-1 spectrometer for measuring the ultraviolet emission of the atmosphere on the IKB-1300 satellite. M.Yu.Kozlovskii, V.G.Kurt, M.D.Nusinov, T.V.Perevodchikova, Yu.S.Pogodin, L.P.Smirnova, M.Gogoshev, S.Sargoichev.
Cosmic Res. (USA), vol.20, no.4, p.451-60 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.620-30 (July-Aug. 1982). [received: April 1983]
The method of calibrating the ultraviolet spectrometer installed on board the Interkosmos-Bulgaria 1300 satellite for measuring the resonance emission of the upper atmosphere of the Earth between 1150 and 2500 Å is presented. A description of the high-vacuum measurement apparatus is given. The results of a calibration using a PMT calibrated agaist a synchrotron accumulator are presented. (24 refs.)

69361 Seismic transducers: load amplifiers and signal conditioners. IV. C.Parmigiani.
Elettron. Oggi (Italy), no.1, p.159-70 (Jan. 1983). In Italian.
For pt.III see ibid., no.12, p.239 (1982). The first section deals with load amplifiers. It includes sample schematics and some mathematical relationships and performance curves. There is a photograph of a low noise level load amplifier. The triboelectric effect is described, with the help of a diagram. The effect of a shunt resistance in the input of a load amplifier is described, with the help of further schematics. Some numerical examples are given and worked out and some further mathematical relationships are given. A series of graphs is given. These show increase of noise with frequency, the 'slow rate' effect, a curve for an integrator circuit and a nomogram for calculating 'slow rate'. A section describes the methods of preparing signals for piezoresistive accelerometers, with two simple schematics. The preparation of the accelerometer is also described. (2 refs.) *G.V.D.*

69362 Resistivity/depth mapping with airborne electromagnetic survey data. K.-P.Sengpiel (Bundesanstalt fur Geowissenschaften und Rohstoffe, Hannover, Germany).
Geophysics (USA), vol.48, no.2, p.181-96 (Feb. 1983).
Using the homogeneous half-space as a universal interpretation model, all of the secondary field data obtained with a single-frequency airborne electromagnetic (EM) system that satisfies the superposed dipole condition can be converted to the model parameters ρ_a (apparent resistivity) and d_a (apparent depth). These parameters are investigated for their behavior above various conductivity models and at various flight altitudes. Moreover, a depth value has a meaning only within the lateral limits of a target conductor. A method is described to locate these lateral limits and to select acceptable depth and resistivity values. The results of the resistivity/depth mapping model are presented in the form of two contour maps. (2 refs.)

69363 Automated identification of rock boundaries: an application of the Walsh transform to geophysical well-log analysis. E.N.Lanning, D.M.Johnson (Univ. of Washington, Seattle, WA, USA).
Geophysics (USA), vol.48, no.2, p.197-205 (Feb. 1983).
A system of orthogonal functions, known as Walsh functions, which assume only the values $+1$ and -1, are presented as a tool appropriate for the analysis of well-log data. Many of the characteristics of these rectangular waveforms, such as discrete transitions in signal level, make them ideal for processing borehole data. Using the generalized Fourier transform, the basic equations for the Walsh transform and Walsh power spectrum are developed showing how the energy in a given signal is distributed among these rectangular wave components. As a first application of the Walsh transform to logging data, a method of computer-aided rock boundary identification is developed and demonstrated on a set of well logs from a continental basalt sequence. (6 refs.)

69364 Airborne gravity is here!. S.Hammer (Dept. of Geology & Geophys., Univ. of Wisconsin-Madison, Madison, WI, USA).
Geophysics (USA), vol.48, no.2, p.213-23 (Feb. 1983).
The achievement of practical and useful airborne gravity exploration for petroleum is a major culmination of more than twenty years of research and development. Commercial surveys have now been conducted for three years. The precision and anomaly resolution attainable are twice as good as that of current shipborne gravity data. The author presents data to demonstrate the precision of airborne gravity and discusses its usefulness. (25 refs.)

69365 Deconvolution of seismograms by the autoregressive method. G.J.Nair (Neutron Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).
Geophysics (USA), vol.48, no.2, p.229-33 (Feb. 1983).
A method of deconvolution of single-channel seismic data based on an autoregressive mode of the time series is discussed. With it one can estimate the primary pulses and the deconvolution function simultaneously in an objective manner. Examples are provided to substantiate the applicability of the method using synthetic data simulating single and multiple explosions. The method is also applied to actual data for a presumed underground explosion from Eastern Kazakh. (10 refs.)

69366 Werner deconvolution of profile potential field data. K.T.Kilty.
Geophysics (USA), vol.48, no.2, p.234-7 (Feb. 1983).
Werner (1953), in analyzing the magnetic fields of dipping, magnetized dikes, proposed a method of separating the field contributed by the particular dike under study from the interference of neighbouring dikes. The author discusses some limitations of the Werner method of deconvolution and also points out some possible extensions of the method to the general interpretation of potential field data. (8 refs.)

69367 Computer processing of vertical seismic profile data. M.W.Lee (US Geological Survey, Denver Federal Center, Denver, CO, USA), A.H.Balch.
Geophysics (USA), vol.48, no.3, p.272-87 (March 1983).
Vertical seismic profiles (VSP) are a powerful tool in a variety of seismic exploration situations. Only after extensive computer processing of the raw field data, however, can the full value of this tool be realized. With the help of processing, relations between important rock parameters and acoustic properties can sometimes be established and highly reliable ties from well logs to surface seismic profiles can usually be obtained. The basic theory of the processing techniques is well known. However, the techniques used in processing standard surface seismic profiles usually must be modified to adapt them to the unique conditions associated with VSPs. Processing procedures, and their relevance to the interpretation of VSP and surface seismic profile data, are described. (8 refs.)

69368 Synthetic body wave seismograms for laterally varying layered structures by the Gaussian beam method. V.Cerveny (Inst. of Geophys., Charles Univ., Praha, Czechoslovakia).
Geophys. J. R. Astron. Soc. (GB), vol.73, no.2, p.389-426 (May 1983).
Several approaches to computing body wave seismograms in 2-D and 3-D laterally inhomogeneous layered structures are suggested. They are based on the Gaussian beam method, which has been recently applied to the evaluation of time-harmonic high-frequency wavefields in inhomogeneous media. Three variants are discussed in some detail: the spectral method, the convolutory method and the wave-packet method. The most promising seems to be the wave-packet approach. In this approach, the wavefield, generated by a source, is expanded into a system of wave packets, which propagate along rays from the source in all directions. The resulting seismogram at any point of the medium is then obtained as a superposition of those packets which propagate close to the point. Numerical examples of synthetic seismograms computed by the wave-packet approach are presented. (91 refs.)

69369 Analysis of palaeomagnetic time series—techniques and applications. C.E.Barton (Graduate School of Oceanography, Univ. of Rhode Island, Kingston, RI, USA).
Geophys. Surv. (Netherlands), vol.5, no.4, p.335-68 (Feb. 1983).
This review is intended to provide an introduction for the nonspecialist to concepts and techniques which are useful for analysing palaeomagnetic time series. Emphasis is placed on analysis in the frequency domain, particularly the periodogram and maximum entropy methods. The review consists of two parts dealing with techniques and applications respectively. (107 refs.)

69370 Review of archaeointensity methods. R.Thomas (Dept. of Geophys., Univ. of Edinburgh, Edinburgh, Scotland).
Geophys. Surv. (Netherlands), vol.5, no.4, p.381-93 (Feb. 1983).
Most of the traditional methods of determining the intensity of the ancient geomagnetic field from archaeological materials utilized thermal demagnetization of the natural remanent magnetization (NRM) and of the laboratory induced thermoremanent magnetization (TRM). When applied rigorously these methods are foolproof. They are, however, very time consuming and the number of samples with which they can be used is limited. Attempts to speed up these traditional methods have generally led to the use of subjective criteria in assessing the reliability of the results and archaeomagnetic research has recently been concentrated on extending the range of samples to which the method can be applied. Through the use of alternating field, rather than thermal, demagnetization of NRM and TRM it has become possible to apply corrections for alteration occurring during laboratory firing of the archaeological samples and develop objective criteria of reliability. Recent research has shown that it may be possible to determine archaeointensities by the laboratory redeposition of lake sediments. (28 refs.)

69371 The chemistry of geothermal waters in Iceland. III. Chemical geothermometry in geothermal investigations. S.Arnorsson, E.Gunnlaugsson (Sci. Inst., Univ. of Iceland, Reykjavik, Iceland), H.Svavarsson.
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.567-7 (March 1983).
For pt.II see ibid., vol.47, no.3, p.547-66 (1983). New data from geothermal wells in Iceland have permitted empirical calibration of the chalcedony and Na/K geothermometers in the range of 25-180°C and 25-250°C respectively. The temperature functions are: $t°C=1112\ (4.91-\log SiO_2)^{-1}-273.15$ and $t°C=933(0.993+\log Na/K)^{-1}-273.15$. Concentrations are expressed in ppm. These temperature functions correspond well with the chalcedony solubility data of Fournier (1973) and the thermodynamic data for low-albite/microcline/solution equilibria of Helgeson (1969). A new CO_2 geothermometer is proposed which is considered to be useful in estimating underground temperatures in fumarolic geothermal fields. (36 refs.)

69372 Precision measurements of rare radioisotopes with a tandem Van de Graaff accelerator. M.Suter, R.Balzer, G.Bonani, M.Nessi, Ch.Stoller, W.Wolfli (Lab. fur Kernphys., ETH, Zurich, Switzerland), M.Andree, J.Beer, H.Oeschger.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1528-31 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The existing accelerator facility has been improved for accurate measurements of rare radioisotopes. So far the system has been applied for ^{14}C dating and studies of ^{10}Be in various geophysical samples. The properties of the accelerator based mass spectrometer have been studied extensively. (8 refs.)

69373 Small accelerators for borehole application. G.R.Morris, C.H.Bush, J.W.Reichardt (Kaman Instrumentation Corp., Colorado Springs, CO, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1648-51 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
After a general discussion on the utility of pulsed high energy neutrons in borehole applications, the authors summarize the operational and environmental characteristics of borehole configured neutron generators. They discuss design, operation and performance characteristics of a 1 11/16" outside diameter generator which has recently been developed for use in geologic well logging. (14 refs.)

69374 Carbon-Oxygen Log applications in complex reservoir evaluation by neutron interactions from (D,T) accelerators. M.J.Lochmann (GeoNuclear Consultants Inc., Abilene, TX, USA), L.O.Berg, R.C.Ivey.
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1652-6 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Granite Wash reservoirs in Oklahoma, Texas, Colorado and New Mexico have proven to be effective commercial producers of hydrocarbons. Substantial drilling activity continues to penetrate this formation either as a primary or secondary objective. A new technique to provide additional lithologic data to engineers and geologists will yield significant benefits in the evaluation and treatment of these reservoirs. This information can be obtained by data available from spectrum analysis through the use of tools such as the Carbon/Oxygen Log, Spectralog and NGS. (7 refs.)

69375 Status of a pulsed-neutron logging probe using a high-purity germanium detector. D.H.Jensen, R.W.Barnard, H.M.Bivens, D.R.Humphreys, J.H.Weinlein, W.A.Stephenson (Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1657-63 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
In 1979 Sandia began the development of a logging tool to identify elements contained in minerals often associated with the deposition of uranium. This tool, a multi-element logging probe containing a high-purity germanium detector, may be used in two modes; passive—which detects the gamma rays emitted from natural radionuclides in a formation, and active—which uses a pulsed neutron generator to irradiate the rock formation surrounding a borehole and detects the gamma rays gnerated from interactions with nuclei in the formation. The authors briefly review the probe design and describe some of the operational experiences and analytical results of field logging work with the probe. (5 refs.)

69376 Experiences with a PFN uranium logging system. R.W.Barnard, W.A.Stephenson, J.H.Weinlein, D.H.Jensen, D.R.Humphreys (Special Applications Div., Sandia Nat. Labs., Albuquerque, NM, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1664-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The Prompt Fission Neutron (PFN) uranium logging system has been used by Sandia National Laboratories for field operations for about six years; during that time, the system has been used at several exploration sites from southern Texas to Wyoming. Some of the improvements, recent changes to the system, and new applications are discussed. (8 refs.)

69377 Restitution of atmospheric optical parameters profiles using laser sounding data. V.E.Zuev, S.I.Kavkyanov, G.M.Krekov.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.3, p.255-66 (March 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
Noiseproof and accuracy of restitution of atmospheric optical parameters are investigated using the data of single-frequency sounding. A statistical model of lidar measurements interpretation is suggested that enables one to use a priori information on noises and solutions for constructing optimal noiseproof interpretation algorithms. (16 refs.)

69378 Relations between the acoustic response (5 kHz) and the lithologic character of sea floor. M.Frappa, M.Duprat (Lab. d'Etudes et de Recherches de Geophys. Appliquee, Univ. de Bordeaux, Talence, France).
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.405-19 (1983). In French.
Studies the ability of seismic methods to probe the structure of seafloor sediments. Seismic recordings are compared to bucket dredged and core samples from a 15 km^2 survey area. (6 refs.)

69379 Isolated sensor ocean bottom seismometer. D.A.Byrne, G.H.Sutton, J.G.Blackinton, F.K.Duennebier (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).
Mar. Geophys. Res. (Netherlands), vol.5, no.4, p.437-49 (1983).
In most of the Ocean Bottom Seismometers (OBS) used today, the sensors, electronics, recorders, flotation, and ballast are contained in one rigid package. Usually this configuration requires a large mass, a large vertical cross section in the water, and relatively small bearing surface area in contact with the bottom, resulting in poor seismic characteristics and increased noise sensitivity. An OBS recently developed at the Hawaii Institute of Geophysics (HIG) minimizes these problems by physically separating the sensor from the main OBS package. Direct comparison between signals recorded by a standard HIG configuration Pop-up Ocean Bottom Seismometer (POBS) and signals from the new Isolated Sensor Ocean Bottom Seismometer (ISOBS), deployed near each other in deep water, clearly demonstrates the advantages of the isolated sensor configuration. (11 refs.)

69380 Survey of high resistivity basement by common measurement of electric and magnetic fields of quasi-stationary point sources. L.Szarka (MTA Geodeziai es Geofizikai Kutato Intezete, Sopron, Hungary).
Magy. Geofiz. (Hungary), vol.24, no.1, p.1-10 (1983). In Hungarian.
One of the basic problems of the geoelectric exploration is to determine the thickness of the high conductivity sediments above a high resistivity basement. The author determines the horizontal electric conductance on the basis of the impedance calculated from the electric and magnetic fields of distant quasi-stationary point sources. Applying the proposed method, the horizontal conductance of the sediments can be determined from artificial noise coming from sources of unknown position and intensity. The results of analogue modeling and field examples prove the correctness of this theory. (7 refs.)

69381 Dynamic sampling. A numerical solution and employment of Fourier transformation for describing the IP effect by system characteristic functions. E.Turai (Nehezipari Muszaki Egyetem, Geofizikai Tanszek, Budapest, Hungary).
Magy. Geofiz. (Hungary), vol.24, no.1, p.11-19 (1983). In Hungarian.
A numerical method for Fourier transformation of sampled signals is discussed. Advantages over the generally used discrete Fourier transformation

and fast Fourier transformation are considered. The Fourier transformation method discussed is suitable amongst others for the transformation of induced polarisation (IP) curves and for describing the IP-effect by system characteristic curvers. (6 refs.)

69382 The maximum entropy method (MEM), determination of time series spectra by MEM. M.Varga (MTA Geodeziai es Geofizikai Kutato Intezete, Sopron, Hungary).
Magy. Geofiz. (Hungary), vol.24, no.1, p.20-2 (1983). In Hungarian.
Presents an extension to the paper on the 'Use of maximum entropy method in geomagnetic time series' by Szendroi, (1983) Varga, Vero (1983) and gives a theoretical summary of the subject. The author describes the program package in a digested form. (4 refs.)

69383 Use of maximum entropy method in geomagnetic time series. J.Szendroi, M.Varga, J.Vero (MTA Geodeziai es Geofizikai Kutato Intezete, Sopron, Hungary).
Magy. Geofiz. (Hungary), vol.24, no.1, p.23-32 (1983). In Hungarian.
In the reduction of geomagnetic observatory or magnetotelluric field data determination of the data spectrum is a frequent process. In both cases there is a problem in computing a good quality spectrum from relatively short recordings (that contain few complete waves). To solve this problem estimation of maximum entropy spectrum was developed. The authors describe the effectivity of MEM spectrum estimation. The use of MEM is favourable if one wants to show the presence of several periods in a given time. The method does not give precise information about the power ratio of certain components. (1 ref.)

69384 Lidar system for visibility monitoring. F.Castagnoli, M.Morandi, I.Pippi, B.Radicati (CNR-IROE, Firenze, Italy).
Opt. & Quantum Electron. (GB), vol.15, no.3, p.261-8 (May 1983).
Describes a Lidar (light detection and ranging) system. It allows high-speed data acquisition of Lidar signals and meteorological parameters by means of standard instrumentation. The Lidar, controlled by a computer, utilized two laser sources (Nd: Yag and ruby), a modified Ricthey-Chretien telescope and signal detection, storage and real-time monitoring equipment. The whole system was installed in a container for field experiments. (13 refs.)

69385 A method of construction of a resonator radio refractometer. B.A.Levin, V.A.Pavlyushnev, N.K.Proschechkin.
Radio Eng. & Electron. Phys. (USA), vol.27, no.6, p.68-71 (June 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.6, p.1128-31 (June 1982). [received: May 1983]
A new method is proposed for measurement of the index of refraction of the atmosphere by the resonator method which uses a discrete scanning of frequency of the exciting signal. The error resulting from the suggested method of measuring is analyzed and the instrument error of the realized radio refractometer is estimated. One of the technical realizations of the instrument is briefly described, its block diagram and external photographs are given. The RMS error of measurement of the index of refraction by a radio refractometer with discrete frequency scanning was not more than ±0.1 *N*-units. (7 refs.)

69386 Density distribution of the flux of delayed fission neutrons in water. E.G.Vertman.
Sov. At. Energy (USA), vol.53, no.2, p.574-5 (Aug. 1982). Translation of: *At. Energ. (USSR)*, vol.53, no.2, p.116-17 (Aug. 1982). [received: April 1983]
Activation analysis of geological material for uranium and thorium, based on the method of delayed neutrons, imposes especially stringent requirements on the recording units. In order to improve the sensitivity of the method, it is necessary to maximize the neutron recording efficiency and minimize the background. This can be achieved by a suitable choice of detectors and by using the optimum measurement geometry. The author investigates the density distribution of the flux of delayed fission neutrons from a point source in water in order to determine the optimum recording geometry. (3 refs.)

69387 Grid generation for environmental flows. W.C.Thacker (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.266-9, vol.2
For numerical models based on the shallow water wave equations, computational grids should be configured so that the distance separating neighboring points is proportional to the local depth. A fully automatic scheme for generating such grids for natural basins with varying bathymetry is presented. (27 refs.)

69388 Estimation of the atmospheric path radiance from multispectral infrared images. T.Yokota (Nat. Inst. for Environmental Studies, Ibaraki, Japan), H.Hanaizumi, M.Inamura, S.Fujimura, H.Toyota.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.319-28 vol.1
Described is a method for extracting the spatial pattern of the atmospheric path radiation, substantially due to water vapor in the IR region from remotely sensed data. The authors use three IR bands 4.3-5.5 μm, 4.5-4.9 μm, and 10.5-12.5 μm. The atmosphere gives different affects on the data in the bands. By computer simulation and experiments using actual data it is confirmed that the ratio (W(10.5-12.5)-W(4.5-4.9))/(W(10.5-12.5)-W(4.3-5.5)) calculated from the data obtained in the three bands is an increasing function of path radiance. Sufficient conditions for band selection are also discussed. (4 refs.)

69389 Main advances and needs on the study of geothermal resources in Chile by using remote sensing techniques. M.F.Araya (Univ. de Chile, Santiago, Chile), R.L.Piraces, M.P.Pardo.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.577-86 vol.1
Successful preliminary results have been obtained in several pilot experiments related to the study of geothermal resources in the Los Andes Range, Chile by using remote sensing techniques. These results are related to prospecting and exploration stages of a geothermal field. Multispectral and multitemporal satellite and aereal photographs and images have been used for these purposes. Based on the results, a general global program is intended to study geothermal resources along the whole country. This methodology is also applied to other countries along the Los Andes Range. The main aspects of the performed experiments and the future activities related with this global program are included. (4 refs.)

69390 Microwave remote sensing of sea ice. R.K.Hawkins, A.L.Gray, C.E.Livingstone, L.D.Arsenault (Canada Centre for Remote Sensing, Ottawa, Ontario, Canada).
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.789-99 vol.1
Reviews a series of airborne microwave experiments on sea ice conducted by the Canada Centre for Remote Sensing during the period 1979 to 1982. Principal sensors used include a Ku-band, dual-polarized scatterometer, a K-band radiometer and the SAR-580, a synthetic aperture radar operating at X-, C-, and L-bands with dual polarization. The potential of simultaneous active and passive sensors for the detection and identification of various sea-ice classes is examined with profiling sensor data and the implication for operational reconnaissance is supported by radar imagery examples. The influence of radar parameters, including frequency, polarization, incidence angle, resolution, and sensitivity, on the interpretability of microwave imagery of sea ice is discussed for airborne and satellite systems. (27 refs.)

69391 Microwave signatures and mapping of snow. E.Schanda, C.Matzler, K.Kuenzi, S.Patil (Inst. of Appl. Phys., Univ. of Berne, Berne, Switzerland), H.Rott.
Actes du Symposium International de la Commision VII de la Societe Internationale de Photogrammetrie et Teledetection (International Society of Photogrammetry and Remote Sensing Commission VII International Symposium), Toulouse, France, 13-17 Sept. 1982 (Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982), p.801-9 vol.1
Ground-based and satellite-borne microwave sensors have been used to investigate and utilize the microwave signatures of snow. Typical signatures for dry and wet snow can be used to identify and quantify this type of snow. Also some unusual behavior of the snow cover (e.g. melt-freeze cycles, precipitation) can be identified by remote microwave probing. The feasibility of mapping the global snow cover (extent, water equivalent, onset of snow melt) has been demonstrated with the use of Nimbus-7 SMMR data. (10 refs.)

69392 Ring core magnetometers at 200°C [oil well application]. M.R.Foster, R.E.Poole, J.A.Skinner (Plessey Electronic Systems Res. Ltd., Havant, England).
Colloquium on 'High Temperature Electronics', London, England, 23 March 1983 (London, England: IEE 1983), p.5/1-2
A requirement has arisen for the use of magnetometers as a 3-dimensional compass system to measure the Earth's field components in 3 axes at the bottom of an oil well, in order to establish the orientation of the tool. The depth of an oil well can be of the order of 4 miles or so, with a maximum ambient temperature at the bottom of about 100°C. Refrigeration methods are possible, but inconvenient, and it was requested that the possibility of using standard magnetometers be investigated. The authors provide a short summary of the methods of sharing magnetic fields, the considerations for high temperature operation and a qualitative account of the preliminary investigations made. 94.00 AERONOMY AND SPACE PHYSICS

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

69393 The dynamic response of the high-latitude thermosphere and geostrophic adjustment. M.F.Larsen (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA), I.S.Mikkelsen.
J. Geophys. Res. (USA), vol.88, no.A4, p.3158-68 (1 April 1983).
It was found that certain features of the response of the high-latitide thermosphere to inputs of energy and momentum can be explained qualitatively in terms of the theory of geostrophic adjustment. The adjustment process is critically dependent on the ratio of the scale size of the forcing to the Rossby radius of deformation, a natural parameter of the mean atmospheric state. When the ratio is small, large wind speeds are efficiently generated by a momentum source. When the ratio is large, changes in the mass field associated with a heat source are more effectively produced. The variation of the Rossby radius with height explains the qualitatively different responses of the high-latitude E and F regions during disturbed geomagnetic conditions as shown by both observations and numerical models. The E region is a more efficient generator of large winds, whereas the F region creates perturbations equally well in the mass field and the wind field. (33 refs.)

69394 Meridional neutral winds in the thermosphere at Arecibo: simultaneous incoherent scatter and airglow observations. R.G.Burnside (Dept. of Atmospheric & Oceanic Sci., Univ. of Michigan, Ann Arbor, MI, USA), R.A.Behnke, J.C.G.Walker.
J. Geophys. Res. (USA), vol.88, no.A4, p.3181-9 (1 April 1983).
Simultaneous measurements of ion and neutral wind velocities have been obtained at Arecibo, Puerto Rico, on several nights in both the summer and winter seasons. The diffusion velocity of O^+, calculated in an analysis by using the accepted value for the ambipolar; diffusion coefficient and the MSIS model atmosphere, is found to be in fairly close agreement with the observations. Incoherent scatter radar data have also been used to derive height profiles of the meridional neutral wind velocity. In the spring and summer months, the meridional wind is strongest near 2100 AST, with a southward velocity ranging from 50-100 m s^{-1}. At about 0100 AST the 'midnight descent' of the F layer occurs, in association with a slackening, or sometimes a reversal, of the meridional wind. (29 refs.)

69395 Thermospheric odd nitrogen. I. NO, $N(^4S)$, and $O(^3P)$ densities from rocket measurements of the NO δ and γ bands and the O_2 Hertzberg I bands. R.P.McCoy (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3197-205 (1 April 1983).
Airglow emissions from the upper atmosphere were measured with instruments on a sounding rocket launched on November 7, 1979. The nitric oxide delta and gamma bands and the molecular oxygen Herzberg I bands were observed at evening twilight with a pair of ultraviolet spectrometers and a photometer. Nightglow emission of NO and O_2 were measured on the upleg. Twilight NO gamma band fluorescence and NO delta band chemiluminescence were measured on the downleg. The altitude profiles of the NO and O_2 nightglow emissions were inverted to yield the density of $O(^3P)$ between 90 and 120 km and the density of $N(^4S)$ between 100 and 200 km. These observations provide the first simultaneous measurements of the thermospheric densities of NO, $N(^4S)$, and $O(^3P)$. (51 refs.)

69396 Thermospheric odd nitrogen. II. Comparison of rocket observations with a diffusive transport chemical model. R.P.McCoy (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3206-10 (1 April 1983).
For pt.I see ibid., vol.88, no.A4, p.3197-205 (1983). A one-dimensional model of thermospheric odd nitrogen chemistry is used to simulate simultaneous rocket measurments of NO, $N(^4S)$ and $O(^3P)$ at twilight. Good agreement between the observations and the model is obtained for the $N(^4S)$ densities above 100 km and for the NO densities above 130 km. Differences between the $N(^4S)$ profiles from the upleg nightglow and downleg twilight airglow measurements are consistent with the diurnal variation of $N(^4S)$ predicted by the theory. The model shows that with high thermospheric temperatures the diurnal variation of NO decreases, while the $N(^4S)$ diurnal variation increases. This behaviour is attributed to the temperature sensitivity of the rate for the production of NO from $N(^4S)$ and O_2. The model is used to predict the solar cycle dependence of the NO chemiluminescence. (24 refs.)

69397 Concerning sources of $O(^1D)$ in aurora: electron impact and dissociative recombination. W.E.Sharp, D.Ortland, R.Cageao.
J. Geophys. Res. (USA), vol.88, no.A4, p.3229-32 (1 April 1983).
The electron impact and dissociative recombination source functions of $O(^1D)$ in the aurora are examined. The data from nine AE-D passes plus one rocket flight are examined at altitudes between 150 km and 335 km. It is found that in nighttime aurora 90% of the total source function is unidentified below 200 km. Electron impact (including thermal electrons) and dissociative recombination are probably adequate source functions above 250 km. (11 refs.)

69398 Solar variability and minor constituents in the lower thermosphere and in the mesosphere. G.Brasseur, P.de Baets, A.de Rudder (Inst. d'Aeronomie Spatiale, Brussels, Belgium).
Space Sci. Rev. (Netherlands), vol.34, no.4, p.377-85 (April 1982). [received: April 1983] (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The variation in the solar irradiance related for example to the 11-year cycle leads to changes in the photodissociation and photo-ionization of the upper and middle atmosphere. The strength of the particle precipitation is also modified. These phenomena are responsible for cyclic variations in the concentration of neutral constituents such as water vapor, nitric oxide, atomic oxygen and ozone, and of ionic compounds in the E- and D-region. Such effects have been simulated by means of a zonally-averaged two-dimensional model taking into account the latitudinal and seasonal dependences. As an example, the increase of thermospheric nitric oxide with solar activity, the corresponding enhancement of the downward flux of NO reaching the stratosphere during the winter and the impact of this effect on the photoionization will be considered. (22 refs.)

69399 Infrared emission of nitrogen oxide during the heating of the thermosphere. B.F.Gordiets, M.N.Markov.
Sov. Phys.-Lebedev Inst. Rep. (USA), no.8, p.42-6 (1982). Translation of: *Sb. Kratk. Soobshch. Fiz. AN SSSR Fiz. Inst. P.N. Lebedeva*, no.8, p.48-53 (1982).
It is shown theoretically that during magnetic storms which heat the gas to 2500-4000K, the NO concentration at altitudes 120-500 km reaches 1-10% of the total concentration, and the volume density of the infrared radiation is 10^{-3} erg.sec^{-1}.cm^{-2}. The calculations explain the results of cosmic experiments which measured the infrared radiation, and the anomalous concentrations of NO and N. (8 refs.)

94.10Q Airglow and nightglow

69400 Measurements of metastable $N^+(^1D)$ 6584 Å emission in the twilight thermosphere. D.G.Torr, W.A.Abdou, M.R.Torr (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA), R.G.Burnside, J.W.Meriwether,Jr..
J. Geophys. Res. (USA), vol.88, no.A4, p.3190-6 (1 April 1983).
Measurement of the 6584-Å emission that arises from the transition $N^+(^3P-{}^1D)$ were made at Sutherland, South Africa, in the summer of 1977. The twilight variations show a rapid decay at sunset from >10 R to 1 R followed by a persistent emission at ~1 R into the very later twilight. The authors identify the early twilight emission as being produced mainly by photodissociation ionization of N_2 and estimate a branching ratio $\beta \simeq 0.1$ for the production rate of N^+ in the (^1D) state. The authors conclude that electron quenching is the main loss process with an estimated value of $\sim 10^{-7}$ cm^3 s^{-1} for its rate coefficient k. (18 refs.)

94.10S Aurora

69401 A rocket observation of the 6300 Å/5200 Å intensity ratio in the dayside aurora: implications for the production of $O(^1D)$ via the reaction $N(^2D)+O_2 \rightarrow NO+O(^1D)$. R.Link (Centre for Res. in Experimental Space Sci., York Univ., Downsview, Ontario, Canada).
Geophys. Res. Lett. (USA), vol.10, no.3, p.225-8 (March 1983).
An analysis of rocket AMF-VB-41 measurements of the spatial variation of the I6300/I5200 intensity ratio in the dayside cleft and polar cap ionosphere is reported. The measured variation of the I6300/I5200 ratio is not consistent with significant production of 6300 Å emission via the reaction $N(^2D)+O_2 \rightarrow NO+O(^1D)$. An upper limit to the $O(^1D)$ yield of 0.1 is obtained for this mechanism. (12 refs.)

69402 N I [3466 Å] AND N I [5200 Å] emissions from various nighttime and daytime auroras. G.G.Sivjee, R.A.Marshall (Geophys. Inst., Univ. of Alaska, Fairbanks, AL, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3153-7 (1 April 1983).
N I [$2p^3$ $2P \rightarrow {}^4S$, 3466 Å] and N I [$2P^3$, $^2D \rightarrow {}^4S$, ~5200 Å] multiplet radiations were monitored simultaneously from various nighttime and daytime auroras by using two large through-put co-aligned spectrophotometers. Measurements were made around winter solstice periods at Longyearbyen (Λ=74°N), Svalbard, where large (>20°) solar depression angles, even during local midday, permitted continuous round the clock observations. Average energy of particles precipitating in auroras sighted over Longyearbyen ranged from a few keV at night to less than a hundred eV in the midday cusp section of the auroral oval; the corresponding atmospheric heights of peak auroral-energy deposition varied from around 110 km, where molecular species are the major constituents of the atmosphere, to above 200 km, where atomic species are more dominant. The intensity ratio I [5200 Å]/I [3466 Å] varied in dynamic auroras associated with large changes in auroral energy flux. (35 refs.)

Concerning sources of $O(^1D)$ in aurora: electron impact and dissociative recombination ....See Entry 69397

94.20 PHYSICS OF THE IONOSPHERE

(for planets, see 96.30)

69403 Investigation of sporadic solar radio emission and parameters of the Earth's ionosphere by Intercosmos-Copernicus 500. VI. Morphological and spectral characteristics of electron density in the ionosphere. V.I.Aksenov, G.M.Artem'eva, G.P.Komrakov, L.A.Skrebkova.
Cosmic Res. (USA), vol.20, no.4, p.383-91 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.542-51 (July-Aug. 1982). [received: April 1983]
For pt.V see Kosm. Issled., vol.18, no.5, p.740-7 (1980) or Cosmic Res., vol.18, no.5, p.536-42 (1980). Results are given for studies of inhomogeneities in the electron density obtained in 1973 using the Intercosmos-Copernicus 500 satellite. A high-frequency impedance device on the satellite (working frequencies of 3.1 and 15 MHz) provided measurements of the electron density in the innosphere in the range from 10^3 to 1.8×10^6 cm^{-3}, and inhomogeneities with sizes from 0.5 to 100 km and relative fluctuations $\Delta N/N \geq 3 \times 10^{-4}$. The probability for the appearance and intensity of inhomogeneities is studied. A spectral analysis is made of them for middle and equatorial latitudes for day-and nighttime periods during calm and disturbed geomagnetic conditions for altitudes in the ionosphere from 200 to 1500 km. (8 refs.)

69404 Variations in the intensity and anisotropy of precipitating particle fluxes with energies above 30 keV. V.I.Altyntseva, A.V.Dronov, A.S.Kovtyukh, M.I.Panasyuk, N.M.Polekh, S.Ya.Reizman, E.N.Sosnovets.
Cosmic Res. (USA), vol.20, no.4, p.392-9 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.552-9 (July-Aug. 1982). [received: April 1983]
Using Cosmos 900 data, spatial-temporal variations in the precipitation of electrons with energies of 50-80 keV and protons with energies of 210-320 keV are compared during the magnetic storm on July 29, 1977. In contrast with the protons, electron precipitation has the form of short bursts and is stronger in the morning-day sector. It is found that anisotropy in the electrons decreases as the fluxes increase, and their magnitude is limited by a critical

level. An excess of precipitating electron fluxes over quasitrapped ones has been observed in the auroral zone. (23 refs.)

69405 Measurements of the stability of energetic electron beams in the ionosphere. G.R.J.Duprat, B.A.Whalen, A.G.McNamara (Hertzburg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), W.Bernstein.
J. Geophys. Res. (USA), vol.88, no.A4, p.3095-108 (1 April 1983).
A Nike Black Brant V rocket was launched from the Churchill Research Range (Manitoba) on December 3, 1979, into a bright east-west oriented auroral arc. The rocket payload consisted of two separable sections, each containing its own telemetry and a full set of wave and charged particle detectors. An electron gun, carried in the main payload, produced a pulsed electron beam with energies of 1.9, 4, and 8 keV at 1, 10, and approximately 100 mA in a programed format. Charged particle observations from the flight are used to define the spatial distribution of perturbed volume surrounding the accelerator during gun firing. The radial dimensions of the perturbation were found to scale with the primary electron beam gyroradius and current and were also dependent on the beam injection angle. On magnetic field lines near the gun, the induced return electron energy spectrum is characterized by a monotonically decreasing intensity with increasing energy out to the approximate beam energy. At increasing distances across field lines the energy spectrum takes on a monoenergetic appearance peaked near the beam energy. All beam-induced electron fluxes drop rapidly to background at the edge of the perturbed volume. Other aspects of the electron beam-plasma interaction are described. (25 refs.)

69406 Observations of small-scale auroral vortices by the S3-2 satellite. W.J.Burke (Air Force Geophys. Lab., Hanscom Air Force Base, Bedford, MA, USA), M.Silevitch, D.A.Hardy.
J. Geophys. Res. (USA), vol.88, no.A4, p.3127-37 (1 April 1983).
The purpose of this paper is to present a detailed examination of two small-scale electrodynamic structures observed at low altitudes by the S3-2 satellite. Both events were detected near the dawn-dusk meridian, in the southern auroral ionosphere, during a substorm period. (33 refs.)

69407 Three-dimensional current flow and particle precipitation in a westward travelling surge (observed during the Barium-GEOS rocket experiment). H.J.Opgenoorth (Uppsala Ionospheric Obs., Uppsala, Sweden), R.J.Pellinen, W.Baumjohann, E.Nielsen, G.Marklund, L.Eliasson.
J. Geophys. Res. (USA), vol.88, no.A4, p.3138-52 (1 April 1983).
During the Barium-GEOS rocket experiment on September 24, 1979 the passage of a westward travelling surge (WTS) was observed over Scandinavia. Extended instrument networks in that area allowed simultaneous observation of the two-dimensional character of magnetic and electric field disturbances and particle precipitation associated with the auroral feature. By combination of the different datasets and additional information from particle and electric field measurements aboard the Barium-GEOS rocket it was possible to derive the two-dimensional distribution of ionospheric electric fields and conductivities and to model the three-dimensional current flow in the vicinity of the westward travelling surge. The main feature of the resulting model current system is the presence of a localized upward field-aligned current directed out of the head of the surge and fed by a westward electrojet, which is composed of both Hall and Pedersen currents. (44 refs.)

69408 Influence of the *E* region dynamo on equatorial spread *F*. W.B.Hanson, S.Sanatani (Center for Space Sci., Univ. of Texas, Richardson, TX, USA), T.N.L.Patterson.
J. Geophys. Res. (USA), vol.88, no.A4, p.3169-73 (1 April 1983).
The integrated *E* region Pedersen conductivity can be an important parameter in determining whether the bottomside of the equatorial *F* layer will be stable against the Rayleigh-Taylor gravitational instability. The *F* layer is observed to become unstable when it rises to great heights after sunset. One effect of this height rise is to decrease the stabilizing influence of ion-neutral collisions at *F* region heights. It is shown here that the same eastward electric field that raises the *F* layer also decreases the Pedersen conductivity of the *E* region, which further destabilizes convective overturning. Because the conductivity of magnetic tubes that penetrate the main *F* layer is large compared to the *E* layer contribution, these effects are important only for the bottomside of the equatorial *F* layer. (13 refs.)

69409 Conjugate studies of an isolated equatorial irregularity region. E.J.Weber (Air Force Geophys. Lab., Hanscom AFB, MA, USA), J.Aarons, A.L.Johnson.
J. Geophys. Res. (USA), vol.88, no.A4, p.3175-80 (1 April 1983).
Coordinated ground and airborne measurements were conducted at three points along the Ascension Island magnetic meridian to investigate the distribution of scintillation-producing (km scale) ionospheric irregularities within an isolated equatorial plasma depletion. Airglow measurements near the northern Appleton anomaly show that irregularities are confined to the region within a 6300-Å airglow depletion. The airglow measurements are then used to map the depletion region along magnetic field lines for comparison with scintillation measurements near the magnetic equator and near the conjugate point at Ascension Island. Results show that the irregularity region is magnetic flux tube aligned and conjugate over north-south distances of ~ 3000 km. (21 refs.)

69410 Theoretical modeling of low-latitude Mg^+. C.G.Fesen, P.B.Hays (Space Phys. Res. Lab., Univ. of Michigan, Ann Arbor, MI, USA), D.N.Anderson.
J. Geophys. Res. (USA), vol.88, no.A4, p.3211-23 (1 April 1983).
F region metal ion morphology is important because these long-lived ions act as tracers of the dynamical processes. The behavior of Mg^+ was inferred from the 2800 Å resonance emission observed by the Visible Airglow Experiment on the Atmosphere Explorer E satellite. Data were obtained over 5 months near winter solstice during solar maximum conditions. Theoretical modelling the Mg^+ densities was undertaken by solving the coupled continuity and momentum equations for one major and one minor ion. A uniform layer of 100 metal ions cm^{-3} at the lower boundary of 125 km was assumed. The calculations reproduced the observed appearance of largest metal ion densities in the early afternoon in winter solstice conditions, and number density profiles that are nearly altitude independent near the equator near noon. Longitudinal effects are apparent mainly at high altitudes ($\gtrsim 350$ km) near dusk. The influence of E-region dynamics on the F-region is studied. (41 refs.)

69411 Monte Carlo calculations of the O^+ velocity distribution in the auroral ionosphere. A.R.Barakat, R.W.Schunk, J.P.St.-Maurice (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3237-41 (1 April 1983).
The O^+ velocity distribution in the high latitude *F* region has been calculated by using a Monte Carlo technique. The calculations were restricted to the altitudes where O^+-O collisions dominate, i.e. between about 200-350 km. The Monte Carlo calculations confirm the earlier predictions, which were based on a simple relaxation collision model, that the O^+ velocity distribution takes a toroidal shape for large convection electric fields. However, the toroidal features appear only for electric fields greater than about 80-100 mV/m when a more rigorous ion neutral collision model is used, whereas the relaxation collision model predicted toroidal features for electric fields greater than about 40 mV/m. Since a toroidal velocity distribution is unstable, ionospheric irregularities can be expected at altitudes between 200-350 km when the convection electric field exceeds 80-100 mV/m. (19 refs.)

69412 Ionospheric plasma cloud dynamics via regularized contour dynamics. I. Stability and nonlinear evolution of one-contour models. E.A.II.Overman, N.J.Zabusky (Dept. of Math. & Statistics, Univ. of Pittsburgh, Pittsburgh, PA, USA), S.L.Ossakow.
Phys. Fluids (USA), vol.26, no.4, p.1139-53 (April 1983).
The linear stability and nonlinear evolution of a regularized contour dynamical model of an ionospheric plasma cloud (or deformable dielectric) is examined. That is, the cloud is modeled by piecewise-constant ion density regions and the regularization is accomplished with a tangential diffusion operator that models aspects of the diffusion operator in two dimensions. A complete linear stability analysis of a circular cloud shows that a single-mode excitation 'cascades downward' in wavenumber as it grows in amplitude, a process that results from the symmetry-breaking electric field. Approximate formulas are derived for the amplitude growth and cascade-down phenomena and verified with precise numerical calculations. A simple rescaling shows that clouds with large λ (=cloud-ion density/ambient-ion density) evolve more slowly and appear more dissipative. The regularized contour-dynamical algorithm for computations in the nonlinear regime is validated against the linear analysis and truncation errors are assessed by using different spatial resolutions. Calculations in the nonlinear regime show the experimentally observed 'backside' striations. Furthermore, at long times, a secondary structure arises on the sides of the primary striations. A comparison of simulations with different λ shows that nonlinear effects arise sooner in normalized time (but longer in real time) if λ is larger. (26 refs.)

69413 Controlled stimulation of magnetospheric electrons by radio waves: experimental model for lightning effects. R.A.Goldberg, S.A.Curtis (Lab. for Planetary Atmospheres, NASA/Goddard Space Flight Center, Greenbelt, MD, USA), J.R.Barcus, C.L.Siefring, M.C.Kelley.
Science (USA), vol.219, no.4590, p.1324-7 (18 March 1983).
Magnetospheric electrons precipitated by ground-based coded very low frequency radio transmissions have been detected by rocket measurement of bremsstrahlung X-rays, caused by impact of the electrons with the upper atmosphere. The direct correlations obtained between the very low frequency signals and the X-rays demonstrate the limits of sensitivity required and indicate that this remote sensing technique would be useful for future study of very low frequency effects induced by single lightning strokes. (18 refs.)

69414 The connection between radiation belt and auroral processes. J.M.Cornwall (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.235-43 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The aurora with its associated electric fields and energetic particles affects the structure of the ionosphere, plasmaphere, and ring current. It injects protons and heavier ions (He^+, O^+) into the magnetosphere which can yield energy to or absorb energy from the ring current and plasmasphere via electromagnetic ion-cyclotron interactions. Its parallel electric fields are determined by perpendicular convection electric fields, which may (on a sufficiently long time scale) be themselves strongly affected by the ring current. The authors briefly review some of these connections, with emphasis on the relationship between between parallel potential drops and the gross convection pattern. (33 refs.)

69415 Plasmasphere and its interaction with the ring current. K.I.Gringauz (Inst. for Space Res., Moscow, USSR).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.245-57 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
In the last few years (after 1976) new instruments have been used for plasmaspheric studies ('mutual-impedance' probe, ion energy-mass spectrometers) which have led to new results. The existence in the plasmasphere of previously unknown ions (He^{2+}, O^{2+}) was revealed and the pitch-angle distributions of ions with energies 10-20 eY were measured. New measurements confirmed the existence of a 'hot' ('warm') zone in the outer plasmasphere and of a midday-midnight asymmetry of the plasmasphere. The source of outer plasmasphere heating is apparently the ring-current decay; electrons are heated less than ions. The plasmasphere is not only the medium of ring current decay, but it appears that it is one of the ring-current ion sources. (25 refs.)

69416 Electric fields in the ionosphere and magnetosphere. R.A.Greenwald (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.305-15 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Reviews low altitude observations of the high latitude convection electric field as obtained with a variety of instruments including polar orbital spacecraft, barium, incoherent and coherent scatter radars, and ground-based magnetometers. There still appears to be some contradiction in the observations, particularly with regard to plasma flow into and out of the polar cap. Also there does not appear to be any simple relationship between the sign of B_y and the local time location of the throat region. Rather, under active conditions, it appears that the plasma entry and exit regions rotate towards earlier times and there is a significant component of dawn-dusk now across the polar cap. Superimposed on this may be some B_y-dependence of the plasma entry region. (27 refs.)

69417 Dynamics of the disturbed ionosphere. H.Volland (Radioastron. Inst., Univ. of Bonn., Bonn, Germany).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.327-35 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The ionospheric storm process at *F* layer heights is reviewed and an explanation in terms of wind-induced diffusion of atomic oxygen is given. (15 refs.)

69418 Ionospheric disturbances resulting from ion-neutral coupling. J.G.Luhmann (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.337-46 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Recent advances in subjects related to ion-neutral coupling in the disturbed ionosphere are summarized. Areas of emphasis include traveling ionospheric disturbances, ionospheric irregularities and the atmospheric dynamo. (63 refs.)

69419 Meteorological control of the D region. J.Taubenheim (Central Inst. of Solar-Terrestrial Phys., Berlin-Adlershof, Germany).
Space Sci. Rev. (Netherlands), vol.34, no.4, p.397-411 (April 1982). [received: April 1983] (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
After a short review of the characteristics of the ionized state and meteorology of the mesopause region, the winter anomaly of the *D* region electron density and its variability are described as manifestations of meteorological control. A major mechanism is the redistribution of nitric oxide, another important mechanism is the strong temperature dependence of cluster ion formation rates. The meteorological control can be described either in a 'concerted' scenario of more or less independently acting mechanisms, or in a 'unitary' scenario where all mechanisms are regarded as effects of a common cause, viz. the strong winter vortex circulation of the middle atmosphere. (41 refs.)

69420 Simplified evaluation of propagation characteristics for HF radio waves reflected from the ionospheric F2 layer. M.Lockwood (Rutherford Appleton Lab., Chilton, England).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.233-7 part 2
New algorithms are presented for the rapid evaluation of ordinary-wave, basic maximum usable frequency (MUF) and mirror-reflection height (h_T) of F2-layer skywave modes, in terms of input parameters regularly scaled from ionograms. The errors in the values calculated by these algorithms are assessed. Comparisons are made with existing simplified procedures, having regard to method complexity and evaluation time. (10 refs.)

69421 Prediction and observation of HF propagation modes and signal intensities. J.Caruana.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.238-43 part 2
Compares some observations of sky-wave propagation modes and their signal intensities with predictions generated by the Australian Ionospheric Prediction Service (IPS) pathloss computer program. The predicted quantities are the monthly median values of either the available signal power at the input to the receiver of the RMS field strength at the antenna of the receiver. The recorded data were obtained from the Defence Research Centre at Salisbury, Australia (DRCS), and from the CCIR Data Bank. The IPS pathloss program is based on the second CCIR interim method of making signal intensity predictions. IPS uses its own world grid-point maps of ionospheric characteristics and basic MUF formulae. (7 refs.)

69422 Short-term variability in HF radio wave absorption at Camden (34°S, 151°E). B.G.Ferguson.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.244-8 part 2
The short-term variability (occurring on time scales of minutes to hours) in the amplitude of the single frequency A1 measurements obtained at Camden during 1980 was found to be associated with changes in the deviative absorption. This variability was observed to be diurnally and seasonally dependent, being most prevalent in the afternoon around the equinoxes and essentially absent in summer. The source of this variability (the effects of which pervade the data) is enhanced electron-density gradients (ledges) occurring at the base of the E region which perturb the normal E region electron-density profile and cause the absorption to decrease by 10-30 dB. The variability in HF radio wave absorption is probably linked with dynamical processes occurring in the E region of the ionosphere. The other parameters affecting absorption, namely the electron-neutral collision frequency, together with the intensity and direction of the earth's magnetic field, are not considered important in the present study because their variations occur on much longer time scales (months to years). (11 refs.)

69423 A revised set of coefficients to represent the global variation of foF2. C.M.Rush, M.PoKempner, D.Anderson, F.Stewart, J.Perry.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.249-53 part 2
Briefly describes the process used to determine the new coefficients for foF2 and to illustrate the improvement in specifying foF2 using the new coefficients. (15 refs.)

69424 Predicting BBC external broadcasting HF transmissions by minicomputer. R.Fricker.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.254-8 part 2
The External Services of the BBC have been broadccsating HF skywave transmission for many years, and for the planning of these it is useful to have a prediction method which can be carried out by a minicomputer. The method can predict the regularity of the propagation and the field strength of transmissions from any location to any other location for any month of the year and for any sunspot number. A method for use on a programmable calculator has been developed and adapted for use on a minicomputer. The method has been extended for use up to 10 hops on the F layer, and up to 30000 kms. Predictions are made for the centre transmission frequency in each of the nine broadcasting bands, and at intervals of every two hours throughout the twenty four, with the option of predicting for a given time or times. (1 ref.)

69425 'The boundary fence'—limits to bistatic auroral field aligned propagation over large areas of Europe. C.E.Newton.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.259-62 part 2
Concerns the maximum range limitations that the auroral mode imposes on participating stations. Only contacts in excess of 800 kilometres are used. For convenience it has been assumed that 'E' layer aurora is at 110 kilometres height, for which the isoflectional maps have also been drawn, and the operating frequency is in the VHF two-metre amateur band (144-146 megahertz). (4 refs.)

69426 Dynamics of the ionosphere during disturbed conditions. A.K.Barbara, M.Devi, P.Bardoloi, K.Rahman (Dept. of Phys., Gauhati Univ., Assam, India).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.263-7 part 2
Using amplitude and phase data of Radio Beacons at 140 and 136 MHz from ATS 6 and ETS II taken at Gauhati (26.20°N; 91.75°E), an attempt has been made to study the dynamics of the ionosphere during highly disturbed conditions (i) during the solar eclipse of Feb. 16, 1980 and (ii) during the severe geomagnetic storm of Dec. 19, 1980. The two events have caused drastic changes in the normal ionospheric conditions in different ways, but from analysis of the structures, periodic fluctuations and temporal variations of the irregularities, it is concluded that large and small scale irregularities generated during both the disturbed conditions came possibly from the same origin. (15 refs.)

69427 Ionospheric indices for monthly and daily use. P.J.Wilkinson.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.268-72 part 2
The derivation of monthly ionospheric indices is reviewed and then applied to daily data to obtain daily global ionospheric indices. Some applications of the daily indices to forecasting are then discussed. (7 refs.)

69428 Long term variation of the noon-time critical frequency of the F 2 layer of the ionosphere over Delhi in relation to sun-spot numbers and 10 cm solar flux. C.S.R.Rao (Res. Dept., All India Radio, New Delhi, India).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.273-5 part 2
An analysis of the noon-time frequency of the F2 layer of the ionosphere over Delhi from 1948 to 1981 is studied in relation to the corresponding variations in the sunspot numbers and 10 cm solar flux. (4 refs.)

69429 Estimation of ionospheric cross-modulation. N.M.Maslin.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.299-303 part 2
Provides a brief overview of the physical processes involved in the phenomenon, outlines a simple theory, discusses and reviews its limitations, and provides a more reliable method of predicting the likely cross-modulation effects produced on broadcast transmissions. (20 refs.)

69430 Nonlinear effects in the ionospheric propagation of high power radio waves. T.B.Jones, T.Robinson (Univ. of Leicester, Leicester, England), P.Stubbe, H.Kopka.
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.304-7 part 2
Describes some observations of nonlinear effects associated with the generation of FAI by highpower radio waves, and provides an explanation of the phenomena involved in terms of current theory. The physical processes which give rise to the observed effects are outlined in order to provide a basis for the presentation of the experimental results in the subsequent sections. (11 refs.)

69431 Long distance reception of TV signals through ionosphere. T.C.Ramadorai, C.S.R.Rao (Res. Dept., All India Radio, New Delhi, India).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.318-20 part 2
The Delhi (28°40′N; 77°10′E) Television transmitter operates on band-I channel-4 (video 62.25 MHz, sound 67.75 Mhz) with 50 kw ERP and effective antenna height of 87 m. Rohtak (28°55′N; 76°25′E) is situated at about 65 Km towards North West of Delhi and gets a median field strength of 30 to 40 dB (uv/m) from the Delhi TV Transmitter. TV viewers in the Rohtak area complained of interference in the reception of the Delhi channel. Investigations revealed that the interfering transmitter operates on channel-3 with the signal strength of 30 to 35 dB (uv/m) and causes interference to upper adjacent channel due to insufficient protection ratio. (5 refs.)

69432 Interference for sporadic-E propagation at frequencies around 70 MHz. K.J.Edwards, L.Kersley, L.F.Shrubsole (Univ. of Coll. of Wales, Aberystwyth, Wales).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.321-4 part 2
While an extensive observational campaign to investigate the occurrence of sporadic-E propagation on lower Band I television frequencies was carried out by the European Broadcasting Union in the 1960s, at higher frequencies little is available to guide the spectrum planner. The authors discuss observations within the frequency range 59.25 to 77.25 MHz which have been made on a near-continuous basis since 1972. (4 refs.)

69433 Experimental results for the 144 MHz transequatorial propagation in the Euro-African sector. C.G.Fimerelis, N.K.Uzunoglu (Nat. Tech. Univ. of Athens, Athens, Greece).
Third International Conference on Antennas and Propagation ICAP 83, Norwich, England, 12-15 April 1983 (London, England: IEE 1983), p.325-8 part 2
Some new experimental TEP results are reported specifically for the top 144 MHz frequency band and for radio circuits between Athens (Greece), Limassol (Cyprus) on Europe and Harare (Zimbabwe), Pretoria (S Africa) on Africa. Parameters such as circuit reliability, duration and signal strength during the 'openings' signal fading and spreading are presented for the three radio circuits. The geographic areas where the 'mean' TEP is observable is also discussed. (5 refs.)

94.30 PHYSICS OF THE MAGNETOSPHERE

(for planets, see 96.30)

69434 Exit of boundary layer plasma from the distant magnetotail. W.J.Heikkila (Center for Space Sci., Univ. of Texas, Richardson, TX, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.218-20 (March 1983).
It is pointed out that the boundary layer plasma must somehow leave the magnetospheric system. It is proposed that the boundary layers on the dawn and dusk flanks are continued into the far magnetotail, becoming joined together far downstream, still on closed magnetic field lines. Within the com-

bined layer there would be a dusk to dawn electric field for antisunward convection (as is the case for the boundary layers on the dawn and dusk flanks nearer to the earth). It is suggested that the boundary layer flow is so massive that the flow itself can generate the right electric field for continued flow. Most of the plasma in the mantle over the polar caps would also be convected out in a similar manner, rather feeding the plasma sheet. There would be a stagnation point inside the magnetotail, with any boundary or mantle plasma diffusing earthward of this point becoming the plasma sheet. It is deduced that no steady state solution is possible. (18 refs.)

69435 Neutral sheet current interruption and field-aligned current generation by three dimensional driven reconnection. T.Sato (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA), T.Hayashi, R.J.Walker, M.Ashour-Abdalla.
Geophys. Res. Lett. (USA), vol.10, no.3, p.221-4 (March 1983).
The authors have simulated externally driven reconnection by solving the magnetohydrodynamic equations in a three-dimensional, tail-like geometry. As reconnection proceeds, the tail current is interrupted locally and field aligned currents are generated. The field aligned current flows towards the ionosphere on the morning side and away from the ionosphere in the evening. The field aligned currents flow in a narrow band at the outer edge of the plasma sheet. Thus, the simulation demonstrates that the nightside substorm current system is a natural consequence of the driven reconnection model. (26 refs.)

69436 Charge neutrality and plasma distribution function in a dipole magnetic field. R.Rajaram, M.Roy (Indian Inst. of Geomagnetism, Bombay, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.804-7 (Oct. 1982). [received: April 1983]
The problem of charge neutrality in a low-density plasma trapped in a dipole magnetic field and subjected to a weak electric field (normal to the magnetic field) has been examined. It has been argued that the braking of the electric field can result in the build-up of charge separation unless the redistribution of protons and electrons in the system continuously neutralizes it. The restriction that this imposes on the possible forms of the distribution function has been reduced and discussed. The geophysical relevances of the results obtained have also been presented. (9 refs.)

69437 Lower hybrid drift instability with temperature gradient in a perpendicular shock wave. Y.M.Zhou, H.K.Wong, C.S.Wu (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), D.Winske.
J. Geophys. Res. (USA), vol.88, no.A4, p.3026-34 (1 April 1983).
The lower hybrid instability is studied in the perpendicular bow shock geometry including finite beta effects and an electron temperature gradient. The flute ($k_\parallel=0$) mode, which for constant electron temperature is stable at the shock, is destabilized for sufficiently large temperature gradient ($\epsilon_T \rho_i \gtrsim 1$). Numerical solutions are presented for cases in which the ion distribution is either a drifting Maxwellian or consists of two Maxwellians to represent the effect of reflected ions at the shock. Implications of the results concerning ion and electron heating and electron acceleration at the bow shock are also discussed. (39 refs.)

69438 Stability of electron distributions within the Earth's bow shock. M.F.Thomsen, H.C.Barr, S.P.Gary, W.C.Feldman, T.E.Cole (Earth & Space Sci. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3035-45 (1 April 1983).
The linear Vlasov stability of a class of electron velocity distributions which model those observed within the Earth's bow shock is examined. The study is restricted to electrostatic waves which propagate parallel to the ambient magnetic field **B**. Two instabilities are identified which are driven by free energy in the direction parallel to **B**: an ion acoustic wave with real frequency below the ion plasma frequency and an electron acoustic wave with real frequency of several times the ion plasma frequency. The characteristics of the unstable waves are in accord with obvervations obtained within the bow shock, in particular, with the trend of the observed electrostatic waves to be polarized parallel to the magnetic field. The instabilities identified may contribute to electron dissipation in collisionless shocks. (12 refs.)

69439 A source of the backstreaming ion beams in the foreshock region. M.Tanaka (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), C.C.Goodrich, D.Winske, K.Papadopoulos.
J. Geophys. Res. (USA), vol.88, no.A4, p.3046-54 (1 April 1983).
A new source mechanism is proposed for the 'reflected' ion beams observed in the foreshock region of the Earth's bow shock. In this model the beams originate in the magnetosheath downstream of the quasi-perpendicular portion of the shock. The quasi-perpendicular shock transition is characterized by two downstream ion populations including high-energy gyrating ions in addition to the directly transmitted anisotropic ions. The authors show by particle simulations that this highly anisotropic downstream ion distribution ($T_\perp/T_\parallel \gg 1$) can excite electromagnetic ion cyclotron waves which, in turn, pitch angle scatter the gyrating ions in a few ion gyroperiods. As a result, some ions acquire large parallel velocities and move fast enough along the convecting downstream magnetic field to escape back across the bow shock into the upstream region. The distribution of escaping ions calculated by using the pitch-angle-scattered ions, as a source, becomes a beam with a large temperature anisotropy $T_\perp \sim 3\text{-}5\ T_\parallel$ and a mean velocity along the magnetic field of about twice that of the solar wind velocity. (30 refs.)

69440 Characterization of geostationary particle signatures based on the 'injection boundary' model. B.H.Mauk, C.-I.Meng (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3055-71 (1 April 1983).
To lend further support to the 'injection boundary' concept, this paper characterizes the details of geostationary particle signatures using a very simpleminded analysis procedure. The signatures are generated using the time of flight effects which evolve from an initial sharply defined, double-spiraled boundary configuration. By using only the most fundamental characteristics of standard convection configurations, the very complex and highly variable dispersion patterns frequently observed by geostationary satellites are successfully reproduced. In particular, seven distinctly different ion-electron paired dispersion patterns on energy versus time spectrograms (1 eV to 100 KeV) are predicted, and all seven of these are observed on a regular basis by both the SCATHA satellite (in the near geostationary orbit) and the ATS-6 satellite. It is concluded that most dynamical dispersion features (including energetic ion and electron echoes) can be mapped to the double-spiral boundary without further ad hoc assumptions. (23 refs.)

69441 Computer simulation of whistler mode wave-particle interactions using a free-boundary encounter model. K.Hashimoto (Dept. of Electrical Engng., Kyoto Univ., Kyoto, Japan), H.Matsumoto, Y.Serizawa, I.Kimura.
J. Geophys. Res. (USA), vol.88, no.A4, p.3072-8 (1 April 1983).
Computer simulations of whistler mode wave-particle interactions have been performed by using a free-boundary encounter model electromagnetic code. The free boundary is attained by adding a collision dominated damping region near one boundary to remove periodicities usually used in electromagnetic codes. In this model, a wave front encounters a resonant bi-Maxwellian hot electron beam. Spatial amplitude modulations are observed in this simulation. The dips of the amplitude, however, sometimes decrease to zero levels. The null points of the wave magnetic field and the associated phase reversals of the wave cannot be described by the usual particle trapping theory. A component of the field contains a feature reminiscent of a double sideband (DSB) wave without a carrier. This is interpreted as a beat between an incident wave and a generated wave. (15 refs.)

69442 Electrostatic bursts generated by electrons in Landau resonance with whistler mode chorus. L.A.Reinleitner, D.A.Gurnett, T.E.Eastman (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3079-93 (1 April 1983).
Recent studies of wideband plasma wave data from the ISEE 1 and ISEE 2 spacecraft have revealed that whistler mode chorus emissions in the Earth's outer magnetosphere are often accompanied by high-frequency bursts of electrostatic waves with a frequency slightly below the electron plasma frequency. Investigations have shown that in some cases the electrostatic waves are modulated at the chorus frequency. Further studies indicate that these bursts are produced by a 'beam' of electrons in Landau (longitudinal) resonance with the chorus wave and thus moving at the chorus phase velocity. A threshold exists in the chorus intensity below which the electrostatic bursts do not appear. The high-frequency electrostatic waves are believed to be caused by a type of two-stream instability called the resistive medium instability. The resistive medium instability is characterized by a reduction in the electrostatic burst frequency below the electron plasma frequency. (32 refs.)

69443 Generation of lower hybrid waves by inhomogeneous electron streams. M.J.Keskinen, J.D.Huba (Plasma Phys. Div., Naval Res. Lab., Washington, DC, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3109-15 (1 April 1983).
A linear, electrostatic, kinetic theory of velocity-sheared inhomogeneous electron streams flowing parallel to a magnetic field is presented. This development, which includes the effects of a density gradient, background plasma, and electron collisions, is valid for arbitrary T_{es}/T_i and T_{eb}/T_i, where T_{es}, T_{eb}, and T_i are the temperatures of the sheared electrons, background electrons, and background ions, respectively. For hot electron streams $T_{es}/T_i \gg 1$ and $T_{es} \gg T_{eb}$, the authors find a new resonant instability driven by velocity shear with freqeuncy near the lower hybrid frequency. This mode is characterized by wave numbers k such that $kr_{Les} \lesssim 1$, where r_{Les} is the sheared electron gyroradius and is damped by collisional effects. Application is made to wave turbulence in the auroral zone and solar corona. (29 refs.)

69444 Numerically simulated two-dimensional auroral double layers. J.E.Borovsky, G.Joyce (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3116-26 (1 April 1983).
Electrostatic plasma double layers are numerically simulated by using a magnetized $2^1/_2$ dimensional particle-in-cell system, periodic in one direction and bounded by reservoirs of Maxwellian plasma in the other. The simulations of both oblique and two-dimensional double layers show periodic instability, indicate Debye length rather than gyroradii scaling, and reveal low-frequency electrostatic turbulence and electron beam excited electrostatic electron-cyclotron waves. Simulated electric field and electron beam data resemble referenced satellite measurements of oppositely directed electric fields within auroral regions and of precipitating electrons in inverted v events. Estimates are given for the thicknesses of auroral double layers and for the separations within multiple auroral arcs. The temporal modulation of accelerated beams is investigated. Simulations including the atmospheric backscattering of electrons predict the presence of an ionospheric sheath that acts to accelerate ionospheric ions upward. (21 refs.)

69445 Upstream waves and particles. C.T.Russell, M.M.Hoppe (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.155-72 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The region upstream from terrestrial, planetary, and interplanetary shocks in which the magnetic field lines are connected to the shock is filled with a variety of plasma waves, MHD waves, energetic electrons, and ions associated with the near presence of the shock. These upstream waves and particles present the researchers with a natural plasma laboratory which is providing basic information on plasma instabilities and collisionless shock physics, as well as insight into how cosmic ray acceleration may occur in the interstellar medium. Much remains to be done, however, before present empirical knowledge is woven into the stronger fabric of theoretical understanding. (58 refs.)

69446 IMF control of the Earth's magnetosphere. A.Nishida (Inst. of Space & Astronautical Sci., Tokyo, Japan).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.185-200 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Recent progress in the understanding of the IMF control on the Earth's magnetosphere through the reconnection process is reviewed. Major points include (1) the identification of the magnetopause structure under the southward IMF polarity to be the rotational discontinuity and the resulting interference that the reconnection line is formed in the equatorial region, and (2) the confirmation from several observational aspects that under the northward IMF the reconnection takes place in the polar cusp. The point (1) is consistent with the observed correlations of geomagnetic indices with IMF but raises an important theoretical issue, and the point (2) is accompanied by an interesting issue of explaining why the polar cap electron precipitation is more energetic under such IMF conditions. Critical studies have reaffirmed the view that the energy supplied by reconnection is partly transported directly to the ionosphere to drive the DP-2 type current system but at the same time it is partly stored in the magnetic field of the tail to be unloaded 0.5~1 hr later to produce the expansion phase of substorm. (51 refs.)

69447 Magnetic structure of the boundary layer. E.W.Hones,Jr. (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.201-11 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
It now appears that magnetospheric convection is driven by both magnetic reconnection and 'viscous' dragging of closed flux tubes acting in varying proportions but with reconnection being, on the average, the predominant cause. But the action of the closed flux tubes of the low latitude boundary layer seems predominant in driving system 1 field aligned currents and discrete auroras. A search of ISEE boundary layer data for the magnetic shear effects associated with field aligned currents has revealed, on some occasions, a 'reverse draping' of boundary layer field lines whose cause might be plasma entry around the cusps, a north-south asymmetry in current flow to the polar regions, or magnetic reconnection at high latitudes. Observed asymmetries in the nature and distribution of boundary layer encounters suggest that the boundary layer and/or the plasma mantle may differ substantially at the

dawn and dusk sides of the magnetosphere and that there may be seasonal dependencies of their properties. (12 refs.)

69448 Plasma processes within the magnetosphere boundaries. A.A.Galeev (Space Res. Inst., Acad. of Sci., Moscow, USSR).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.213-20 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
A brief summary is presented of recent progress in estimating the rates of energy, momentum and mass transport of the solar wind through the magnetopause in terms of an analysis of the nonlinear stage of various plasma instabilities. It is shown that the energy supply to the Earth's magnetosphere is due to reconnection on the dayside magnetopause and its dissipation during magnetospheric substorms, being controlled by both the interplanetary field parameters and by the dynamic pressure of the solar wind. (30 refs.)

69449 The Earth's ring current: causes, generation, and decay. D.J.Williams (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.223-34 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The development of currents due to arbitrary distributions of trapped particles in the geomagnetic field is described. These currents form the Earth's ring current and are responsible for world wide decreases of the surface magnetic field observed during magnetic storms. It is shown that the relative abundances of the ions forming the ring current are not yet known. Because of this it is not known how various sources mix to produce the ring current. Several possible generation mechanisms are discussed. Finally, the decay of the ring current is discussed and is shown to be due primarily to charge exchange with important secondary effects attributable to wave-particle interactions. (39 refs.)

69450 Wave generation in the terrestrial magnetosphere. D.J.Southwood (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.259-70 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The Earth's magnetosphere supports a large variety of plasma wave phenomena covering nine decades of frequency from 10^{-3} Hz to 10^{-3} Hz. Understanding why waves occur when and where they do involves sorting out the subtle interplay between the background macroscopic features of the system, the geometry, the large scale flow, etc., and the microphysics of the plasma populations that take part. The convection induced by the solar wind produces pathological plasma phase space distributions because collisions are unimportant. Such distributions may have steep spatial gradients, inverted energy distributions or strong pitch angle anisotropy, any of which can act as a free energy source for plasma waves. Large currents along the magnetic field transmit stresses between magnetosphere and ionosphere. If the electrons carrying such currents have high enough drift velocity, waves are generated. Several very different examples of magnetospheric wave generation are reviewed. (62 refs.)

69451 Wave particle interactions as an energy transfer mechanism between different particle species. R.Gendrin (Centre de Recherches en Phys. de l'Environnement, CNET, Issy-les-Moulineaux, France).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.271-87 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Recent improvements in experimental techniques and cooperative data analysis efforts have brought a lot of information on the basic mechanisms by which energy can be exchanged between different particle species in the collisionless magnetospheric or solar wind plasmas. Some of these mechanisms are reviewed. A particular emphasis is put on interactions which occur in the equatorial magnetosphere between energetic protons and electromagnetic ultra low frequency (ULF) waves and which are linked with He^+ ion trapping and heating as well as with field-aligned suprathermal electron beam generation. The process by which ion conic distributions are produced by electrostatic ion cyclotron waves generated at high altitude along auroral field lines by drifting electrons is also discussed. (68 refs.)

69452 Electric currents and voltage drops along auroral field lines. D.P.Stern (Planetary Magnetospheres Branch, Goddard Space Flight Center, Greenbelt, MD, USA).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.317-25 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The current state of knowledge concerning Birkeland currents ($j_\parallel$) and parallel electric field ($E_\parallel$) is briefly reviewed. Four types of $j_\parallel$ are discussed—the primary 'region 1' sheets, the 'region 2' sheets which parallel them and which seem to close in the partial ring current, the cusp currents which appear to correlate with interplanetary B_y, and the 'Harang filament'. The energy required by $E_\parallel$ and by the associated particle acceleration processes seems to be derived from $j_\parallel$. Much of the evidence for $E_\parallel$ comes from particles, from 'inverted V' spectra, rising ion beams and expanded loss cones, while 'conics' may signify acceleration by Electrostatic Ion Cyclotron (EIC) waves, associated with beams accelerated by $E_\parallel$. Different theoretical studies predict for $E_\parallel$ a smooth, disordered or abrupt structure, and evidence for all 3 types can be deduced from S3-3 electric field probe observations. (34 refs.)

69453 Cosmic rays from binary neutron stars. W.Kundt (Inst. fur Astrophys., Univ. Bonn, Bonn, Germany).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.59-66 (Feb. 1983).
Revives the suggestion that neutron stars are the dominant source of high-energy cosmic rays. To be more precise: the (relativistic) ionic component of the cosmic rays is argued to be injected by young binary neutron stars ($\lesssim 10^5$ yr) whose rotating magnetospheres act like grindstones in the wind of their companion (Kundt, 1976). The high-energy ($\gtrsim 30$ GeV) electron-positron component may be generated by young pulsars ($\lesssim 10^5$ yr) and by collision processes and the electron component below 30 GeV predominantly by supernova remnants. 69454 Diffusion of low-energy electrons as a function of the position of outburst relative to the interplanetary current sheet. M.A.Zel'dovich, O.M.Kovrizhnykh, M.A.Livshits.
Cosmic Res. (USA), vol.20, no.4, p.399-404 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.560-5 (July-Aug. 1982). [received: April 1983]
A correlation is found between the maximum flux of electrons more energetic than 30 keV produced by solar flares and the maximum intensity of decimetric radio-bursts. It is shown that the conditions for diffusion are most favorable when the flares are distributed near the projection of a sector boundary on the solar surface. On the other hand, with flares located in the center of a sector in a local region of magnetic field with the opposite sign from that of the sector, the electron flux is noticeably weakened. (14 refs.)

69455 Cosmic ray modulations related to the interplanetary magnetic field intensity. S.P.Duggal, M.A.Pomerantz, R.K.Schaeffer, C.H.Tsao (Franklin Inst., Univ. of Delaware, Newark, DE, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.2971-81 (1 April 1983).
Data covering a complete solar cycle (1965-1976) have been analyzed in a comprehensive investigation of the nature of transient modulations of relativistic galactic cosmic rays associated with interplanetary magnetic field intensity excursions in the vicinity of the Earth. The correlation coefficient between the cosmic ray intensity and the IMF magnitude is small, in fact it remains less than 0.5 throughout the solar cycle. In order to understand the nature of field-related modulations and to minimize the complications arising from the effects of other features of solar plasma, the data are here analyzed by the method of superposed epochs. It is demonstrated that, while the days characterized by high IMF magnitude B are associated with intensity decreases, the IMF rarefactions (low B) cause an increase in the flux. Maximum cosmic ray intensity variations associated with both high and low B occur 1 day after the key days characterized by field departures from average values. This indicates that the modulation mechanism becomes efficient only when the plasma engulfment of the Earth extends at least a gyroradius beyond 1 AU. The results suggest that, on average, interplanetary magnetic field intensity variations which are presumably related to disturbances traveling from the Sun are effective transient modulators of the relativistic particles and that the corotation of the modulating region plays a significant role in the recovery of the cosmic ray intensity. (40 refs.)

69456 Theoretical studies of interplanetary propagation and acceleration. J.J.Quenby (Blackett Lab., Imperial Coll., London, England).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.137-53 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Studies evaluating the transport coefficients for energetic particles in interplanetary space are described in relation to particle data. In position space, the main mode of propagation is along field lines but perpendicular diffusion and drift motion are also possible. Diffusion coefficients based on interplanetary magnetic field data are either derived from quasi-linear, adiabatic theory or this theory corrected for finite scattering near 90° pitch angle or by numerical techniques. Relevant particle data includes solar proton event time profile and anisotropy measurements. In general, when Fokker-Planck transport equations solutions are fitted to particle data, the parallel diffusion coefficients obtained still appear rather larger than those given by theoretical estimates. Perpendicular diffusion is shown to be due to field line wandering and random drift motion effects. The importance of drift motion in cosmic ray modulation theory is mentioned. (108 refs.)

69457 MHD structure of an interplanetary stream from Prognoz-7 measurements of the plasma and magnetic field (STIP Interval Number VI, April 25, 1979). G.N.Zastenker, A.N.Omel'chenko, E.G.Eroshenko, K.G.Ivanov, V.A.Styazhkin.
Cosmic Res. (USA), vol.20, no.4, p.404-10 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.566-71 (July-Aug. 1982). [received: April 1983]
Studies the MHD structure of the interplanetary stream on April 25, 1979 by means of measurements of the plasma and magnetic field on the near-Earth spacecraft Prognoz-7. Particular attention is paid to the interaction region between the fast stream (presumably from a low latitude coronal hole) and the slow solar wind. An especially large discontinuity (the stream boundary) divides the interaction region into a forward shock wave with dense hot ($\beta > 1$) turbulent magnetoplasma, and a reverse shock wave with a strong regular magnetic field and cold ($\beta \ll 1$) plasma. (17 refs.)

69458 Variation of the intensity of ultrahigh energy γ-rays with altitude. lu Sui-Ling, Su Shi, Ren Jing-ru, Wang Dian-chen (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.1, p.118-20 (Jan. 1983). In Chinese.
The intensities of ultrahigh energy γ-rays observed in Chinese emulsion chamber experiments at several altitudes, including Yunnan Station (3200 m), Mt. Kambala (5500 m), and the foot of Mt. Qomolangma (Everest, 6500 m)

are summarized. An intensity-altitude relation and in particular, the attenuation length of γ-rays at the foot of Mt. Qomolangma are presented. (7 refs.)

69459 Solar cycle variations of cosmic ray intensity and large-scale structure of the heliosphere. S.P.Agrawal (Vikram Space Phys. Centre, APS Univ., REWA, India).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.127-35 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
This review summarizes some of the recent results obtained by ground-based detectors recording cosmic-ray intensity at high energies (>1 GeV) for almost five decades. The long-term changes observed in the isotropic and anisotropic components of cosmic-ray intensity are presented. It is noted in particular that significant changes occurred in the characteristics of cosmic-ray modulation after the 1969-70 period. Most of these are definitively related to the reversal of the solar poloidal field; their characteristics are described with a view to relate these with the heliospheric configuration. Anomalies in the variational characteristics of both isotropic and anisotropic parts of cosmic ray intensity, noticed particularly during the period of very high speed solar wind streams, are discussed in detail. Phenomena with periodicities of 11 and 22 years occur simultaneously; their relative importance is derived and related to interplanetary variables. Suggestions for further studies, as needed, are also incorporated. (35 refs.)

69460 Effect of neutrino-oscillations on the fluxes of atmospheric neutrinos. D.V.Dass (Indian Inst. of Technol., Bombay, India), K.V.L.Sarma.
Proceedings of the VI High Energy Physics Symposium (papers in summary form only received), Mysore, India, 6-11 Dec. 1982 (Bombay, India: Dept. Atomic Energy 1982), p.28
An analysis of the effects of neutrino oscillations on both the upward and downward fluxes of atmospheric neutrinos is given for different ranges of the oscillation parameters. Some simple relations for the oscillation-modified fluxes of $(\nu_e+\bar{\nu}_e)$ and $(\nu_\mu+\bar{\nu}_\mu)$ in the atmosphere are given as useful future tests of the two-component model.

69461 Cosmic-ray abundances of Sn, Te, Xe, and Ba nuclei measured on HEAO 3. W.R.Binns (Dept. of Phys., Washington Univ., St. Louis, MO, USA), R.K.Fickle, T.L.Garrard, M.H.Israel, J.Klarmann, K.E.Krombel, E.C.Stone, C.J.Waddington.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L93-6 (15 April 1983).
Elements with even atomic number (Z) in the interval $50 \leq Z \leq 56$ have been resolved in the cosmic radiation using the Heavy Nuclei Experiment on the *HEAO* 3 satellite. The observation that $_{50}$Sn and $_{56}$Ba are more abundant than $_{52}$Te and $_{54}$Xe is inconsistent with a pure r-process cosmic-ray source. Adjustment of source abundances for an enhancement of those elements with a low first ionization potential does not change this conclusion. (12 refs.)

69462 Cosmic-ray muon spectrum derived from the transferred energy spectrum of bursts observed by the Mutron calorimeter. K.Mitsui, A.Okada, Y.Kawashima, T.Katamura, S.Matsuno, Y.Muraki, Y.Ohashi, T.Suda (Inst. for Cosmic Ray Res., Univ. of Tokyo, Tanashi, Japan), T.Takahashi, S.Higashi, S.Ozaki, I.Nakamura, Y.Kamiya, K.Kobayakawa, H.Shibata, Y.Minorikawas, S.Mikamo.
J. Phys. G (GB), vol.9, no.5, p.573-93 (May 1983).
Measurements of the energy transfer, E', of bursts produced in a calorimeter are calibrated by the two magnet spectrometers of Mutron. Using this calibrated calorimeter, the authors observed the energy spectrum of bursts produced in the calorimeter up to 10 TeV and derived the muon energy spectrum at sea level. The exponent of the differential pion production spectrum is 2.62 ± 0.10 and 2.75 ± 0.17 in the muon energy region from 200 GeV to 6 TeV and from 1 TeV to 6 TeV, respectively. The muon energy spectrum thus obtained is compared with the direct measurement of the muon spectrum by the Mutron magnet spectrometers. (65 refs.)

69463 Possibility of studying cosmic rays with energies $>10^{20}$ eV. G.A.Gusev, L.G.Dedenko, I.M.Zheleznykh, M.A.Markov (Inst. of Nuclear Res., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.268-71 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.216-19 (20 Sept. 1982). [received: April 1983]
It may be possible to detect extensive air showers at energies above 10^{20} eV on the basis of their radio emission, with the radio waves reflected and scattered from the ionosphere. Estimates show that it would be possible to move up to energies of 10^{22} eV in research on the spectrum of cosmic rays, with statistics on the order of one event per year in the absence of a 'relict cutoff' of the spectrum of cosmic protons or in the case of oblique extensive air showers produced by neutrinos. 94.60 INTERPLANETARY SPACE

(see also 96.60 Solar physics)

69464 On the equation of state of solar wind ions derived from Helios measurements. E.Marsch (Center for Space Res., MIT, Cambridge, MA, USA), K.H.Muhlhauser, H.Rosenbauer, R.Schwenn.
J. Geophys. Res. (USA), vol.88, no.A4, p.2982-92 (1 April 1983).
Observations of solar wind ion velocity distributions made by the Helios spacecraft between 0.3 and 1 AU are used to study the radial evolution of the so-called adiabatic invariants, for example, the ion magnetic moments. Significant differences between the parameters of protons and α particles have been found in dependence on the wind velocity. On the average, adiabaticity is observed to be violated. This violation of adiabatic invariance is interpreted as evidence that protons are heated perpendicular in the field in fast streams and, with less statistical significance, that α particles are cooled more strongly than for adiabatic expansion parallel to the magnetic field. The contribution of the differential streaming energy to the total internal energy of the ions is briefly investigated. Also, average heliocentric radial profiles for the ion heat fluxes are presented, and the possible role of the ion heat flux in supplying thermal energy during the radial expansion of the wind is examined. (34 refs.)

69465 A statistical study of MHD discontinuities in the inner solar system: Helios 1 and 2. F.Mariani (Istituto di Fisica, Univ. di Roma, Rome, Italy).
Sol. Phys. (Netherlands), vol.83, no.2, p.349-65 (March 1983).
A statistical study is made of the magnetic field directional discontinuities observed in early 1976 onboard Helios 1 and 2. Strong day-to-day variations of occurrence rates are found on either tangential or rotational discontinuities. No large variation (if any) is found versus either heliocentric distance or heliographic latitude. This contradicts previous findings obtained by the same technique on Pioneer 8 data in 1968-69; however, reasons are given to expect different results, under different solar conditions. Evidence of crossing of flux tubes on the order of one/hour is presented. (17 refs.)

69466 Helium abundance variations in the solar wind. G.Borrini (Inst. for Plasma Res., Stanford Univ., Stanford, CA, USA), J.T.Gosling, S.J.Bame, W.C.Feldman.
Sol. Phys. (Netherlands), vol.83, no.2, p.367-78 (March 1983).
Helium abundance variations in the solar wind have been studied using data obtained with Los Alamos plasma instrumentation on IMP 6, 7, and 8 from 1971 through 1978. For the first time, average flow characteristics have been determined as a function of helium abundance A(He). Low and average values of A(He) are each preferentially identified with a different characteristic plasma 'state': interplanetary magnetic field polarity reversals and high speed streams, respectively. (67 refs.)

69467 Momentum flux invariance and solar wind sources. R.Steinitz (Dept. of Phys., Univ. of Ulm, Ulm, Germany).
Sol. Phys. (Netherlands), vol.83, no.2, p.379-84 (March 1983).
New solar wind data from Helios-2 are used to study, in a statistical fashion, the relation between proton number density n, flow speed u and heliocentric distance r. It is shown that the average of nu^2r^2 does not depend on flow speed nor on distance, verifying the previously established invariance of momentum flux density (mnu^2) carried by the solar wind. Averages of mnu^2 from different spacecraft do not show correlation with solar cycle. Rather, the close agreement (to within 1.8%) of values from Helios-1 and Helios-2 suggests that the momentum flux density carried by the solar wind may be also constant during the solar cycle. (14 refs.)

69468 Propagation of solar disturbances: theories and models. S.T.Wu (Univ. of Alabama, Huntsville, AL, USA).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.73-83 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Recent theoretical developments and the construction of several models for the propagation of solar disturbances from the Sun and their continuation throughout heliospheric space are discussed. Emphasis centers on physical mechanisms as well as mathematical techniques (i.e. analytical and numerical methods). This outline leads to a discussion of the present state-of-art of theoretically-based modeling efforts in this area. It is shown that the fundamental theory for the study of propagation of disturbances in heliospheric space is centered around the self-consistent analysis of wave and mass motion within the context of magnetohydrodynamics in which the small-scale structures will be modified by kinetic effects. Finally, brief mention is made of some interesting problems for which attention is needed for advancement of understanding the physics of large-scale propagation of solar disturbances in heliospheric space. (20 refs.)

69469 Direct correlations between coronal transients and interplanetary disturbances. R.Schwenn (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.85-99 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Major interplanetary shock waves have often been successfully associated with major solar flares. The interplanetary response to weaker solar events, e.g. eruptive prominences (EP) and slow coronal transients, is far less pronounced. Recently, progress has been made by combining the newly-available data of white-light-coronagraph measurements from the Earth-orbiting satellite P78/1, in-situ plasma measurements from the HELIOS solar probes positioned mostly above the Sun's limb at solar distances between 60 and 200 $R_\odot$ ground based Hα-coronagraphs. In the years 1979 to 1981 about 25 uniquely associated events were identified. The events can be sorted into three main categories: The 'flare-type': 13 events, probably all of them flare-related. The 'EP-type': 4 events, none of them flare-related, at least one was observed as an Hα-EP, transient speed from 200 to 410 km s^{-1}, all post-accelerated (indicating 'driven' injection), all followed by shocks with at least one magnetic cloud, one showing presence of He$^+$ and O^{2+} behind the shock. The 'NCDE-type': 2 events, one observed as an Hα-EP, the other without known solar source, $v_t = 130$ and 470 km s^{-1}, one post-accelerated, the other one not, considerable density increase in interplanetary plasma (however, in pressure equilibrium with surroundings), one event including shock, the other not. (27 refs.)

69470 Observations of interplanetary shocks: recent progress. E.J.Smith (Jet Propulsion Lab., Pasadena, CA, USA).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.101-10 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Interplanetary shock observations since 1978 are reviewed. Since the interval coincides with the recent solar maximum, emphasis is placed on shocks associated with transient solar phenomena, including coronal transients and eruptive prominences as well as flares. A good correlation between shocks and Storm Sudden Commencements has persisted into the recent maximum. Shocks have been identified that are associated with disappearing filaments and coronal transients rather than with flares. Significant progress has been made in the indirect observation of shocks near the Sun as a result of radio wave measurements in interplanetary space and measurement of the scintillation and spectral broadening of spacecraft radio transmissions. Preliminary results regarding the thickness of interplanetary shocks have appeared. Several quasi-parallel shocks propagating more nearly along, rather than across, the magnetic field have been identified. The plasma drivers accompanying interplanetary shocks magnetic field have been identified. The plasmas drivers have received increased attention and distinctive features have been found in electron, ion and magnetic field data. (28 refs.)

69471 Ion acceleration at shocks in interplanetary space: a brief review of recent observations. J.T.Gosling (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.113-26 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The mechanism by which ions are accelerated near the Earth's bow shock and near shocks propagating outward from the Sun in response to solar activity appears to be essentially the same. For both types of shock the solar wind thermal distribution acts as a seed population. Leaked magnetospheric ions and resident flare ions are additional seed populations for the bow shock and outward propagating shocks respectively. The acceleration of solar wind ions at these shocks begins with either the reflection of ions off the shock or leakage of shocked plasma back through the shock. Interaction with a disruption wave field self-generated by these backstreaming ions is reponsible for the remainder of the acceleration at the bow shock. Both the disruption wave field and the ambient interplanetary wave field play important roles in accelerating ions at outward propagating shocks, but on different time scales. The geometry of the shock and the duration of field line connection to the shock play decisive roles in determining what is observed. (31 refs.)

69472 Solar-wind disturbances and the solar wind-magnetosphere energy coupling function. S.-I.Akasofu (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA).
Space Sci. Rev. (Netherlands), vol.34, no.2, p.173-83 (Feb. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Recent studies of the solar wind-magnetosphere interaction are reviewed in terms of the input-output relationship. It is shown that the magnetosphere is primarly a directly driven system and that the interaction constitutes a dynamo. As another important problem of the interaction, the chain of processes is examined by which the dynamo-generated power is transmitted to the polar ionosphere, leading to various auroral phenomena. Possible implications of these magnetospheric findings for solar flare studies are discussed. It emerges from this analysis that in solar-terrestrial physics the solar activity-magnetospheric disturbance relationship should be considered as a single sequence of process involving four dynamos: (1) the solar wind generation dynamo, (2) the sunspot dynamo, (3) the solar wind-magnetosphere dynamo, and (4) the auroral dynamo. As one of the basic problems in solar-terrestrial physics, the importance of a study of causes of the north-south component of the solar wind magnetic field and of its time variations is emphasized as a missing link between solar activity and magnetospheric disturbances. 69473 Satellite orbit perturbations due to the deforming potential of centrifugal forces. M.Bursa (Astron. Inst., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.74-9 (March 1983).
The additional potential in outer space, generated by the deformation of Earth masses due to the variations in the direction of the vector of the Earth's rotation relative to the axes of the Earth's ellipsoid of inertia, is derived. The influence of this potential on the satellite orbit dynamics is studied. (6 refs.)

69474 Spatial and radiometric resolution of the Landsat-3 RBV system. P.Dosiere, C.Justice (ESA/EPO, Frascati, Italy).
Int. J. Remote Sens. (GB), vol.4, no.2, p.447-55 (April-June 1983).
Major constraints on the RBV (Return Beam Vidicon) system spatial and radiometric resolution are the optical limitations of the camera lens, the sensitivity of the vidicon, the system noise and the video sampling rate. The Landsat-3 RBV lens resolution limit is 21.45 m ground equivalent half-cycle. The Earthnet video sampling rate at 7.5 megasamples, gives an across track ground pixel size of 18 m. The along track pixel size is controlled by the number of scan lines in one frame, which gives a ground equivalent pixel size of 24 m. The MTF curve calculated from the RCA manual shows an EIFOV of 45.5 m. At 21.45 m ground equivalent half-cycle, the modulation transfer factor is 5.4 per cent which with a dynamic range of 64 quantising levels gives a two- or three-level contrast between black and white linear ground targets. In the panchromatic waveband with a white level saturation at 2.013 mW/cm^2-sr, most ground cover types will occur within the first 50 per cent of the dynamic range. Given the Earthnet quantisation step size to r.m.s. noise ratio of 0.51, there is a 56 per cent probability of assigning a level to within ±1 value of its correct level. This is assuming a Gaussian distribution for the system noise. The noise is equivalent to the MTF sensitivity of the system at the lens resolution limit. (12 refs.)

69475 Maximizing the entry corridor and minimizing energy expenditures during insertion of a spacecraft into the orbit of an artificial satellite of Jupiter by a composite method. N.M.Ivanov, A.I.Martynov, N.L.Sokolov.
Cosmic Res. (USA), vol.20, no.4, p.372-83 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.529-41 (July-Aug. 1982). [received: April 1983]
Questions of control during the insertion of a glider-type spacecraft into the orbit of an artificial satellite of Jupiter with preliminary aerodynamic braking in the atmosphere and with the use of additional atmospheric correction of the spacecraft's motion are investigated. Solutions of the variational problems of seeking the maximum of the entry corridor width and the minimum of the required energy expenditures in the formation of the orbit are obtained. Some quasioptimal control programs are examined for the atmospheric segment of the motion. Numerical and graphical material is shown. (5 refs.)

69476 The last 14 days of Skylab 1: orbit determination and analysis. D.M.C.Walker (Royal Aircraft Establ., Farnborough, England).
Proc. R. Soc. London Ser. A (GB), vol.387, no.1792, p.187-217 (8 May 1983).
The orbit of Skylab 1 (1973-27 A) has been determined from some 1400 observations during the 14 days before decay on 1979 July 11. There are 14 daily orbits with standard deviations corresponding to average accuracies of 40 mm cross track and 30 m radial. A 15th orbit, only slightly less accurate, was determined from observations on July 11 between the manoeuvre at 07.45 UT and decay at 16.37 UT. The variations in inclination due to atmospheric rotation and 16th-order resonance with the geopotential have been successfully analysed, to give the first values of 16th-order geopotential coefficients determined from resonance, and a value for the atmospheric rotation rate at a height of 210-220 km. The daily changes in semi-major axis have been used to determine 13 daily values of air density, at heights from 252 km down to 179 km. The variations of eccentricity and argument of perigee take unusual forms, but detailed analysis shows that the variations are in full accord with the theory for an atmosphere with day-to-night variation in density, with the perigee progressing towards the point of minimum density. (27 refs.)

69477 Spacecraft charging effects. R.Grard, K.Knott, A.Pedersen (Space Sci. Dept., ESA, ESTEC, Noordwijk, Netherlands).
Space Sci. Rev. (Netherlands), vol.34, no.3, p.289-304 (March 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
This paper gives an overview of electrostatic charging which occurs on spacecraft in different plasma environments. Particular emphasis is given to differential charging between sunlit and shadowed insulated surfaces, a phenomenon which is often observed in the geostationary orbit. It can generate potential differences of several kilovolts between adjacent surfaces. This can lead to discharges and serious spacecraft anomalies such as spurious telecommands caused by voltage and current transients on cable harnesses. Experience with the GEOS and ISEE satellites has demonstrated that differential charging can be avoided by making outer surface elements conductive and connecting them to a common ground. (20 refs.)

69478 Problem of three rigid bodies. Conversion of the Hamiltonian to Delaunay and Andoyer variables. M.Sidlichovsky (Astron. Inst., Czechoslovak Acad. of Sci., Praha, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.65-74 (March 1983).
The problem of three rigid bodies is formulated in Andoyer and Delaunay variables. The Delaunay variables are based on Jacobi coordinates. Knowledge of the density distribution inside the bodies is not required and only their Stokes constants must be known. The Hamiltonian of the problem is presented without truncation. Starting with this Hamiltonian averaged over the fast variables, applies various restrictive assumptions and obtain different approximations of the problem. (13 refs.)

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

69480 The statistics of gravitational lenses: apparent changes in the luminosity function of distant sources due to passage of light through a single galaxy. M.Vietri, J.P.Ostriker (Princeton Univ. Obs., Princeton, NJ, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.488-510 (15 April 1983).
Considers how the apparent distribution of fluxes (*N-F* relation) of point sources seen behind an intervening galaxy will change due to gravitational lensing of the galaxy as a whole or due to mini-lenses within it. The analysis is exact in the limit that the optical depth to lensing is small. There should be a significant increase in the apparent density of quasars seen near galaxies but that a sample of more than $10^{4.5}$ galaxies will have to be studied before a statistically significant result is found. (19 refs.)

69481 Dissipation of MHD waves in an inhomogeneous streaming plasma. R.Singh, K.M.Srivastava (Dept. of Math., Univ. of Roorkee, Roorkee, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.3-18 (Feb. 1983).
The investigation of instabilities adopting the point of view of inhomogeneous mass flow, physically corresponds to consideration of stability of the perturbations whose wavelengths in the direction of plasma inhomogeneities are much larger than the characteristics plasma scale length. The dissipation of hydromagnetic-waves and instabilities takes place due to the inhomogeneous plasma flow. Both the velocity and plasma density vary in the direction perpendicular to the magnetic field. It is found that the Alfven wave branch and magnetosonic branch may be driven unstable by the velocity shear. Instability, oscillatory modes, marginal instability and overstability are worked out. (11 refs.)

69482 Nonlinear Rayleigh-Taylor instability. S.K.Malik, M.Singh (Dept. of Math., Simon Fraser Univ., Burnaby, BC, Canada).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.45-50 (Feb. 1983).
The Rayleigh-Taylor instability in hydromagnetics is investigated with the use of the method of multiple scales. It is shown that when the wavenumber K is equal to the critical wavenumbers K_c, the amplitude modulation of a standing wave can be described by the nonlinear Schrodinger equation from which the nonlinear cutoff wavenumber is subsequently derived. (11 refs.)

69483 On disk accretion. V.A.Urpin (A.F. Ioffe Phys. & Tech. Inst., Acad. of Sci., Leningrad, USSR).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.79-107 (Feb. 1983).
A simple but sufficiently accurate method for calculating an accretion disk structure is developed. The detailed analysis of the accretion disk is fulfilled by using this method. The effect of turbulent heat transfer on the disk structure is taken into account along with the effect of radiative transfer. The turbulent heat transfer is shown to play an important role, and may be even predominant in the inner disk region. The dependence of temperature T and density ρ on the z-coordinate is found. Simple analytic expressions are proposed for the run of the density in all the disk zones. It is shown that the inner disk region is convectively stable. The main parameters of all the zones are derived. The geometry of regular motions is studied; the regular hydrodynamical flows are found to appear directed both toward and outside the central object. A detailed comparison is made with the results of other authors. (41 refs.)

69484 Polytropic spheres with isothermal cores. K.Pandey, A.K.Pande, M.C.Durgapal (Dept. of Phys., Kumaun Univ., Nainital, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.139-45 (Feb. 1983).
The paper deals with massive fluid spheres with an isothermal core (having finite central density) and a polytropic envelope in terms of general relativity. The matching of the solutions in the core and envelope has been done using Bondi's condition, $H=0$ and also without it. The study reveals that since this condition does not correspond to any particular physical situation the maximum values of fractional core size, fractional core mass and the redshift do not occur at $H=0$, but that they occur at some other point. Within the permissible physical conditions ($\mathrm{d}P/\mathrm{d}\rho \leq 1$) the maximum values of M_{core}/M, R_{core}/R and the surface redshift, for an isothermal core $P=\rho/3$, are respectively 0.473, 0.554 and 0.565. Using the condition $H=0$, it has been shown that for isothermal cores corresponding to the equation of the state $P \geq 0.6\rho$, the configurations are pulsationally unstable. (13 refs.)

69485 A self-similar flow of self-gravitating gas behind a shock wave with radiation heat flux. I. J.B.Singh, P.R.Vishwakarma (Dept. of Math., SGR Postgraduate Coll., Jaunpur, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.153-9 (Feb. 1983).
Self-similar flows of self-gravitating gas behind the spherical shock wave propagating in a non-uniform atmosphere at rest, taking radiation heat flux into consideration, are investigated. The total energy of the wave is non-constant and can be made to vary slowly with time. (6 refs.)

69486 A self-similar flow in generalised Roche model with radiation heat flux. II. J.B.Singh, P.R.Vishwakarma (Dept. of Math., SGR Postgraduate Coll., Jaunpur, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.161-9 (Feb. 1983).
For pt.1, entitled 'A self-similar flow in generalised Roche model with increasing energy', see ibid., vol.88, no.2, p.269 (1982). Self-similar flows of a gas moving under the gravitational attraction of a central body of fixed mass behind a spherical shock wave and propagating in a non-uniform atmosphere at rest, taking radiation heat flux into consideration, are investigated. The total energy of the wave between the shock front and inner expanding surface is taken to be time-dependent. (8 refs.)

69487 Gravitational lenses. J.R.Gott,III (Dept. of Astrophys. Sci., Princeton Univ., Princeton, NJ, USA).
Am. Sci. (USA), vol.71, no.2, p.150-7 (March-April 1983).
Cosmic mirages produced by gravitational bending of light may solve some of the most pressing problems in cosmology today. (30 refs.)

69488 Quasi-axisymmetric circulation and superrotation in planetary atmospheres. H.G.Mayr, I.Harris (Lab. for Planetary Atmospheres, Goddard Space Flight Centre, Greenbelt, MD, USA).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.124-36 (May 1983).
Using a spectral model the authors discuss a quasi-axisymmetric circulation in an anisotropic viscous fluid. It is understood that the required large eddy diffusivities may arise from longitudinal disturbances and therefore, basically, the flow is not completely axisymmetric. Solar radiation absorbed at low latitudes drives large scale motions, with air rising near the equator and falling at higher latitudes. Near the equator in particular, where the Coriolis force vanishes, the momentum balance is established between horizontal and vertical eddy diffusion. Applications to Venus, Jupiter and Saturn are discussed. (45 refs.)

69489 Laboratory measurement of the 4_{04}-3_{13} 70 GHz transition ground-state methylene (CH_2). F.J.Lovas, R.D.Suenram (Molecular Spectroscopy Div., NBS, Washington, DC, USA), K.M.Evenson.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L131-3 (15 April 1983).
Measurement of the $N_{\mathrm{KK}}=4_{04}$-3_{13} rotational transition of X^3B_1 CH_2 is reported. The rotational transition is split into three fine-structure components due to electron spin and spin-rotation interactions. These were observed at 68.37 GHz, 69.01 GHz, and 70.68 GHz, each line within 20 MHz of the values predicted from a prior analysis of the far-infrared rotational spectrum. Also, the triplet hyperfine structure due to the proton nuclear spin was well resolved. (9 refs.)

69490 Dyon black hole and its mass formula in the Tomimatsu-Sato-Yamazaki space-time. M.Kasuya (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.347-50 (April 1983).
It is shown that a dyon solution, characterized by five parameters (mass M, angular momentum J, electric change Q, magnetic charge Φ, and distortion parameter δ), has an event horizon for arbitrary odd integer δ and satisfies the Christodoulou-Ruffini mass formula. (5 refs.)

69491 Relativistic paramagnetism. W.T.Grandy,Jr. (Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA).
J. Phys. A (GB), vol.16, no.6, p.1207-14 (21 April 1983).
The equation of state is obtained for a degenerate system of non-interacting, relativistic, neutral fermions with spin $^1/_2$ in a uniform magnetic field. The question of arbitrarily large fields is addressed, and previous results for the ground state are extended to finite temperatures. (13 refs.)

69492 The synthetic method in radiative transfer theory. D.J.Bond (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England).
J. Phys. A (GB), vol.16, no.7, p.L239-42 (11 May 1983).
The utility of the synthetic method for performing non-LTE line radiation transfer calculations is investigated. The stability and convergence of the method are determined for an idealised problem. This analysis is compared to numerical calculations. Regimes where the method is likely to be useful are identified. (6 refs.)

69493 The pure rotation spectrum of the hydroxyl radical and the solar oxygen abundance. A.Goldman, D.G.Murcray (Dept. of Phys., Univ. of Denver, Denver, CO, USA), D.L.Lambert, J.F.Dominy.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.767-76 (May 1983).
Observations of pure rotation $^2\Pi$ (0-0) lines of the hydroxyl radical in the solar photospheric spectrum provide a new and independent determination of the solar oxygen abundance. These OH lines with the Holweger-Muller model atmosphere give $\log \epsilon(0)=8.84$ which is within 0.08 dex of the abundance provided by the [0 I] lines and the same model. It is pointed out that a detection of the CH pure rotation lines would permit a determination of the O/C abundance ratio with a much reduced sensitivity to the model atmosphere uncertainties. Selected combinations of atomic and molecular (not including the OH pure rotation lines) lines give $\log \epsilon(0)/\epsilon(C)=0.23 \pm 0.03$ dex. (29 refs.)

69494 Line ratios for O VII. J.G.Doyle, S.S.Tayal (Armagh Obs., Armagh, N Ireland), A.E.Kingston.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.31p-4 (May 1983).
New theoretical rates for electron excitation of the transitions 1^1S-2^3P and 1^1S-2^3P in O VII are used to calculate the line ratios R_0 (forbidden line to intercombination line) and G_0 (forbidden plus intercombination lines to resonance line). The theoretical values of R_0 are slightly larger than earlier calculations but the values of G_0 are significantly lower than the earlier calculations. With the results the value of $G_0 \doteq 1.0$, from the solar observations of McKenzie and Landecker (1982), would predict an electron temperature of 2.0×10^6K, which is in good agreement with the temperature of 1.8×10^6K predicted by recombination-ionization equilibrium calculations. (17 refs.)

69495 Monopole heat. M.S.Turner (Astron. & Astrophys. Center, Univ. of Chicago, Chicago, IL, USA).
Nature (GB), vol.302, no.5911, p.804-6 (28 April 1983).
The most stringent astrophysical limit on the flux of superheavy magnetic monopoles is based on the energy released when monopoles captured by a neutron star catalyse nucleon decay within the neutron star, and is: $F_G \lesssim 10^{-22}$ cm^{-2} sr^{-1} s^{-1}. This, and other astrophysical bounds, are bounds on the average flux of monopoles in the Galaxy, not on the local flux of monopoles. Monopoles moving more slowly than about $3 \times 10^{-5}c$ (10^{16} GeV m^{-1}) are stopped in the Earth. Inside the Earth they catalyse nucleon decay, resulting in the release of heat. A bound on the local flux of monopoles moving more

slowly than $3\times10^{-5}c$ (10^{16}GeV m^{-1}), $F_{\otimes}\lesssim10^{-21}$ cm^{-2} sr^{-1} s^{-1}, is derived by requiring the energy released to be less than the measured heat flow at the surface of the Earth. Similar arguments are used to derive a bound on the flux of monopoles at Jupiter moving more slowly than $10^{-3}c$ (10^{16} GeV m^{-1}), $F_3\lesssim10^{-18}$ cm^{-2} sr^{-1} s^{-1}. (21 refs.)

69496 Limitation imposed by strong Langmuir turbulence on the shelf-consistency of the quasi-linear dynamics. R.J.-M.Grognard (Div. of Radiophys., CSIRO, Sydney, Australia).
Sol. Phys. (Netherlands), vol.83, no.2, p.207-15 (March 1983).
Strong turbulence occurs when Langmuir waves reach Zakharov's (1972) threshold for the formation and collapse of plasma wave solitons. A more precise criterion, derived by Goldman et al. (1980) in the case of broadband Langmuir noise, is used to derive a necessary condition of self-consistency for models of the quasi-linear dynamics. The results suggest that a regime in which quasi-linear relaxation is important but strong turbulence is not may be relevant to type III solar radio bursts. (12 refs.)

95.55 ASTRONOMICAL INSTRUMENTS

69497 Radio-astronomy antennas for 3K cosmic radiation measurements. P.Bielli, E.Pagana (CSELT, Torino, Italy), G.Sironi.
CSELT Rapp. Tec. (Italy), vol.11, no.2, p.79-83 (April 1983).
The '3K Blackbody' study requires antennas quite different from those currently used for standard radioastronomical observations, because of the peculiar nature of Background Radiation. A first requirement is a main beamwidth 10-15 degree HPBW (Half Power Beam Width). Then extremely low sidelobes and backlobes and very good matching at the input of the antenna are necessary in order to minimize the antenna noise contribution. First investigation showed the possibility of improving the radiation performance of a horn reflector antenna by corrugating the feeding conical waveguide. The final solution consists in a corrugated conical horn which presents excellent radiative characteristics as a middle gain and low noise antenna. (4 refs.)

69498 New infra-red telescope [IRAS]. R.A.J.Arthur.
Indian & East. Eng., vol.124, no.10, p.439-40 (Oct. 1982). [received: March 1983]
A dream of infra-red astronomy for many years is close to realisation with the three-nation Infra-Red Astronomical Satellite. The author describes the new telescope. (no refs.)

69499 One-dimensional telescope aperture for brightness and velocity speckle interferometry measurements. C.Aime, J.Demarcq, F.Martin, G.Ricort (Dept. d'Astrophys., Univ. de Nice, Nice, France).
Opt. Eng. (USA), vol.22, no.2, p.224-6 (March-April 1983).
The use of a telescope with a 'one-dimensional' aperture (10×800 cm, for example) is suggested for high angular speckle interferometry. In the image plane, the speckles are elongated in a direction perpendicular to the entrance pupil. For a given amount of atmospheric turbulence, a one-dimensional pupil gives a contrast gain in the high frequencies region compared to the circular objective having the same resolution limit. Associated with a spectroscope a one-dimensional telescope allows the representation of the spatial-spectral plane with no loss of photons. This is obtained because the image of the telescope aperture is the entrance slit of the spectroscope. It permits precise, high resolution astronomical measurements as a function of wavelength, as well as velocity speckle interferometry at a high level of photons with CORAVEL-type experiments. The study of a domeless, altazimuthal mount, low cost prototype of 4 cm×80 cm, intended for solar observations is currently underway at the Nice Observatory. (13 refs.)

95.65 AUXILIARY AND RECORDING INSTRUMENTS

69500 The near infrared spectrophotometer for the 182 cm Asiago telescope. D.Lorenzetti, R.Orfei, P.Saraceno (Istituto di Fisica, Spazio Interplanetario, Frascati, Italy), F.Strafella, C.B.Cosmovici.
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.171-8 (Feb. 1983).
A new near infrared spectrophotometer has been built for the Asiago 182 cm telescope. The instrument performs both broad band JHKLM photometry and 1-5 μ spectrophotometry; a tracking system on a field star allows closed loop mapping. The design and performance are discussed. (4 refs.)

69501 Star transits with a photoelectric micrometer applied to the transit instrument of Torino Observatory. E.Anderlucci, G.Chiumiento, M.G.Fracastoro, R.Iervolino (Osservatorio Astron. di Torino, Torino, Italy).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.142-5 (May 1983).
A photoelectric micrometer with a multislit grid and a photon counting device has been applied to the reversible transit instrument of Torino Observatory since January 1980. It allows the automatic determination of transit time of stars up to 8.0 visual magnitude. From the analysis of about 1300 observations of FK4 stars the mean square error of the mean transit time for one observation (reduced to the equator) proved to be $\epsilon_i=\pm0.0046$ s. The external mean error deduced from 80 group observations from January to October 1981 taking into account the residuals between $UT1(OAT)$ and $UT1(BIH)$ is $\epsilon_e=\pm0.0104$ s$=\pm0.156''$. The description of the photoelectric micrometer and the method for deriving the transit time from the photometric data are

also given. The photoelectric micrometer is now currently employed for regular observations for the determination of Universal Time with respect to the uniform time scale (*UTC*) in order to contribute to the studies of Earth's rotation. (8 refs.)

69502 High efficiency spectrographs for the EUV and soft X-rays. W.Cash (Lab. for Atmospheric & Space Phys., Univ. of Colorado, Boulder, CO, USA).
IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1535-8 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A basic need of modern UV and X-ray astronomy is the capability to perform high resolution spectroscopy of faint stars. The use of modern grazing incidence optics can be coupled to high blaze angle reflection gratings used in the conical diffraction mount to offer a versatile, efficient approach to the design problem. The author discusses two designs of interest: an echelle spectrograph for use longward of 100 Å, and an objective reflection grating spectrograph for use in the soft X-rays. General design considerations and measurements of grating efficiencies are also presented. (7 refs.)

69503 The Berkeley parasitic SETI program. S.Bowyer, G.Zeitlin, J.Tarter, M.Lampton, W.J.Welch (Space Sci. Lab., Univ. of California, Berkeley, CA, USA).
Icarus (USA), vol.53, no.1, p.147-55 (Jan. 1983).
Parasitic programs for the Search for Extraterrestrial Intelligence (SETI), carried out concurrently with conventional radio astronomical observing programs, can be an attractive and cost-effective means of exploring the large multidimensional search space intrinsic to this effort. The authors describe a microprocessor-based automated SETI acquisition system which searches for and records spectra of narrowband signals in the IF band of an observatory receiver. Data taken with this system over 35 days at the Hat Creek Radio Observatory at 1612 MHz are discussed. Out of approximately 10^5 spectra processed during this period, 4000 were identified by the system as containing narrowband signals and were recorded. Subsequent analysis indicates that over 3900 of these are due to local RF contamination. The remainder are undergoing further investigation. (6 refs.)

69504 The design of polarimeters for astronomy. L.J.Cox (Hatfield Polytech. Obs., Hertford, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.571-9 (May 1983).
The concept of information capacity is used to compare the performance of different designs of astronomical polarimeter, as an aid in selecting the design which is most suited to a particular application. The example chosen to illustrate the method is the comparison of visible-region stellar polarimeters, but the method is of general applicability and the constraints applying to infrared polarimeters are also discussed. (41 refs.)

69505 Space and time resolved soft X-ray spectra using X-ray transmission gratings. N.M.Ceglio, A.M.Hawryluk, R.H.Price (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Opt. Eng. (USA), vol.22, no.2, p.241-6 (March-April 1983).
Gold transmission gratings with 0.3 μm spatial period, 0.6 μm thick have been fabricated and are being used for the spectroscopy of high temperature, laser-produced plasmas. A transmission grating has been coupled with a soft X-ray streak camera producing the first time resolved (20 psec resolution) continuous X-ray spectrum over the range 0.1 to 1.5 keV from a laser-produced plasma. In addition, a transmission grating has been coupled with a high resolution, Wolter-design X-ray microscope to produce an imaging spectrometer of unprecedented spatial and spectral resolution. In laboratory experiments the imaging spectrometer demonstrated a spectral resolving power $(\lambda/\Delta\lambda)$ of 200 and a spatial resolution of 1 μm. (9 refs.)

69506 Infrared camera for ten micrometer astronomy. J.F.Arens, G.M.Lamb, M.C.Peck (NASA/Goddard Space Flight Center, Greenbelt, MD, USA).
Opt. Eng. (USA), vol.22, no.2, p.267-8 (March-April 1983).
Describes an infrared imaging photometer employing a monolithic 32×32 pixel bismuth doped silicon charge injection device array. The device is primarily useful in the 8 to 13 μm atmospheric window. The detector is sufficiently sensitive to provide good performance on ground-based telescopes and promises to be very good for low background space flight operation. (no refs.)

95.70 OTHER INSTRUMENTATION AND TECHNIQUES

(inc. clocks, frequency standards)

69507 A holographic surface measurement of the Texas 4.9-m antenna at 86 GHz [space applications]. C.E.Mayer, J.H.Davis, W.L.Peters,III, W.J.Vogel (Dept. of Electrical Engng., Univ. of Texas, Austin, TX, USA).
IEEE Trans. Instrum. & Meas. (USA), vol.IM-32, no.1, p.102-9 (1982). (CPEM 82 Digest. Conference on Precision Electromagnetic Measurements, Boulder, CO, USA, 28 June-1 July 1982).
An instrument has been built which allows the electromagnetic measurement of the surface accuracy of a large millimeter-wavelength antenna. The University of Texas 4.9-m radiotelescope has been measured with this technique at 86.1 GHz to an accuracy of 4 μm at the surface. The technique is an interferometric one which is fast, accurate, and able to measure the whole antenna surface at once. While the technique is illustrated by its use on a large antenna, it could be used in a near-field measurement of a smaller antenna. Several antenna surface maps are presented. A comparison of run-to-run repeatability was made. The technique itself was tested by deforming the antenna surface in a known way and subsequently detecting the deformation. (23 refs.)

95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

69508 A computer program to reduce photometric data. C.Cunningham, M.Kaitting (Dance Hill Obs., Kitchener, Ontario, Canada).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.10-16 (1982).
A description is given of a computer program written in BASIC and designed to yield ΔV and ΔB magnitudes in the standard UBV system. The program also yields other relevant data, such as standard deviation, mean error, Julian Date, and air mass. (2 refs.)

69509 Method of estimating Langmuir's turbulence in a solar flare. M.Karlicky (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.100-2 (March 1983).
In principle, the theory of hard X-ray emission and microwave solar bursts enables one to determine the development of the 'mean' distribution function of hot or superthermal electrons during the impulse phase of a flare. On the basis of this development of the distribution function of electrons, the method described is used to determine the parameters of Langmuir's turbulence, assumed to exist in a solar flare. (11 refs.)

69510 Method for automatic compensation of geometrical distortions in astronomical television equipment. V.A.Kachmin, Yu.A.Seliverstov.
Sov. J. Opt. Technol. (USA), vol.49, no.8, p.478-80 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.9-11 (Aug. 1982). [received: April 1983]
A method and algorithm are described for the automatic compensation of geometrical distortions, which were developed with consideration given to the specific requirements caused by the unique features of automated astronomical television equipment. The accuracy of the compensation algorithm, formulated on the basis of approximation splines, is evaluated by means of a mathematical model of the geometrical distortions. (8 refs.)

69511 Absentee Astronomy. L.F.Robinson.
Sky & Telesc. (USA), vol.65, no.4, p.310-11 (April 1983).
Discusses the control of telescope operations over very large distances. The Edinburgh UKIRT Remote Observing Facility is discussed. (no refs.)

69512 Phase retrieval in astronomy. J.R.Fienup (Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA).
Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.ThA8/1-5
Reviews a number of proposed methods for reconstructing 2-D objects from stellar interferometry data. Emphasis is placed on an iterative algorithm for reconstructing an object from its Fourier modulus, for which computer-simulation results are shown. (40 refs.)

95.85 CATALOGUES, ATLASES ETC

69513 Two newly discovered S stars in a list of faint red objects. E.R.Craine, D.E.Turnshek, D.A.Turnsheck (Steward Obs., Univ. of Arizona, Tucson, AZ, USA), P.C.Boeshaar.
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.185-91 (March 1983).
Presents a list of 103 faint red stars in a 0.7-square-degree area located near NGC 6820/23 on the galactic plane in the constellation Vulpecula. The stars were selected from Near Infrared Photographic Sky Survey visual and near-infrared photographic pairs and were chosen for their visual faintness as well as their red colors. Since some of these stars may be intrinsically extremely red they are interesting targets for spectroscopic observation. The authors note that two of the stars in the list have already been determined to be faint, pure S stars. (9 refs.)

69514 Sky atlas 2000.0. W.Tirion.
Cambridge, England: Cambridge (1981), 28 pp. [0 521 24467 6]
Sky Atlas 2000.0 is the first comprehensive set of star charts for this new coordinate epoch. It has been carefully planned and executed with the active observer in mind. It contains some 43000 stars to visual magnitude 8.0 and about 2500 deep-sky objects. The deluxe edition, with deep-sky objects and the Milky Way shown in various colors according to the key atop each chart, follows the introduction of the unbounded black-and-white desk and field editions of this atlas; these have, respectively, black stars on a white background and white stars against a black background.

96.00 SOLAR SYSTEM

96.10 GENERAL, SOLAR NEBULA, AND COSMOGONY

69515 Models of the formation of the solar nebula. P.Cassen, A.Summers (Ames Res. Center, NASA, Moffett Field, CA, USA).
Icarus (USA), vol.53, no.1, p.26-40 (Jan. 1983).
Models of the collapse of a protostellar cloud and the formation of the solar nebula reveal that the size of the nebula produced will be the larger of $R_{CF} \equiv J^2/k^2GM^3$ and $R_V \equiv (GMv/2c_s{}^3)^{1/2}$ (where J, M, and c_s are the total angular momentum, total mass, and sound speed of the protostellar material; G is the gravitational constant; k is a number of order unity; and v is the effective viscosity in the nebula). From this result it can be deduced that low-mass nebulas are produced if $P \equiv (R_V/R_{CF})^2 \gg 1$; 'massive' nebulas result if $P \lesssim 1$. The value of J distinguishes most current models of the solar nebula, since $P \propto J^{-4}$. Analytic expressions for the surface density, nebular mass flux, and photospheric temperature distributions during the formation stage are presented for some simple models that illustrate the general properties of growing protostellar disks. (39 refs.)

69516 Some cosmochemical consequences of a turbulent protoplanetary cloud. G.E.Morfill (Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).
Icarus (USA), vol.53, no.1, p.41-54 (Jan. 1983).
Physical processes affecting dust and vapor in a turbulent disk, which is hot in a small central region ($T > 1500$K) and cold at its outer edge ($T \sim 50$K) are discussed. Such disks are obtained from hydrodynamic collapse calculations of rotating gas clouds. While these calculations give the result that most of the disk, including the planetary region, remains cold ($\lesssim 400$K) throughout the evolution of the system, it can be shown, nevertheless, that the information of the hot interior is preserved in solids. Therefore it is suggested that the basic cosmochemical evidence from meteorite analysis, in favor of a hot protoplanetary cloud, can be understood. Detailed calculations involving estimates of sizes, both for inclusions and chondrules, as well as rim structures are given. (48 refs.)

69517 Evolution of cometary perihelion distances in Oort cloud: another statistical approach. B.Lago, A.Cazenave (Centre Nat. d'Etudes Spatiales, Toulouse, France).
Icarus (USA), vol.53, no.1, p.68-83 (Jan. 1983).
The evolution of the perihelion distance distribution in the Oort cloud was studied over the age of the Solar System, under the gravitational perturbations of random passing stars, using a statistical approach. These perturbations are accounted for through an empirical relation relating the change in cometary perihelion distance to the closest-approach comet-star distance; this relation is deduced from a previous study [Scholl, Cazenave, and Brahic, (1982)]. Two kinds of initial perihelion distances are considered: (a) perihelion distances <2500 AU, associated with an origin of comets as icy planetesimals in the region of the giant planets, and (b) larger perihelion distances (up to 5×10^4 AU), possibly representative of comet formation as satellite fragments in the accretion disk of the primitive solar nebula. Distant star-comet encounters, as well as rare close encounters, are considered. Several quantities are estimated. (16 refs.)

96.20 MOON

69518 Sulphur content and sulphur isotope composition of orange and black glasses in Apollo 17 drive tube 84002/1. T.P.Ding (Dept. of Geology & Chem., McMaster Univ., Hamilton, Ontario, Canada), H.G.Thode, C.E.Rees.
Geochim. & Cosmochim. Acta (GB), vol.47, no.3, p.491-6 (March 1983).
The sulphur contents and $\delta^{34}S$ values have been determined for the bulk and various grain size fractions of three 74002/1 lunar drive tube samples. The sulphur contents of the bulk samples are much lower than those of other lunar soils. These samples show an increase of sulphur concentration with decreasing particle size which is more marked than for other soils and indicates that the orange and black glass droplets have a coating enriched in sulphur and other volatile elements. In sharp contrast with other soils, the orange and black glasses have slight positive $\delta^{34}S$ values for large particles while the smallest particle sizes show negative $\delta^{34}S$ values. This indicates that the coating of the glassy droplets is enriched in isotropically light sulphur. These observations favour the theory that the orange and black glasses were generated by a volcanic fire fountain. (25 refs.)

96.30 PLANETS AND SATELLITES

(exc. the Moon; for celestial mechanics, see 95.10; for Earth as an astronomical body, see 91. Geophysics)

69519 The variations of eccentricity and apse precession rate of a narrow ring perturbed by a close satellite. N.Borderies, P.Goldreich (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA), S.Tremaine.
Icarus (USA), vol.53, no.1, p.84-9 (Jan. 1983).
Derives a Hamiltonian which describes the first-order perturbations of orbital eccentricity and apse precession rate of a narrow ring due to a close satellite whose orbit is also eccentric. The treatment covers cases in which the satellite crosses the ring. The level curves of the Hamiltonian are displayed for several values of the parameters. The authors apply results to the interaction of Saturn's F ring with its inner shepherd satellite. (6 refs.)

96.30E Venus

69520 Atmosphere of Venus from optical measurements by Venera-11 and -12. Yu.M.Golovin, V.I.Moroz, B.E.Moshkin, N.F.San'ko, A.P.Ehkonomov.
Cosmic Res. (USA), vol.20, no.4, p.410-29 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.572-94 (July-Aug. 1982). [received: April 1983]
Results of spectral and angular measurements of solar radiation in deep layers of Venus' atmosphere, made by Venera-11 and -12, are presented. The measurements of spectra and of angular scans were carried out over an altitude range from 63 km to the surface. (50 refs.)

69521 Formation of the plasma mantle in the Venus magnetosphere. L.M.Zelenyi, O.L.Vaisberg.
Cosmic Res. (USA), vol.20, no.4, p.438-51 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.604-19 (July-Aug. 1982). [received: April 1983]
A model is proposed for the interaction of the solar wind with Venus, including the formation of the magnetic barrier characteristics of the ionopause, plasma dynamics in the magnetic barrier, and formation of Venus' tail. The formation of the magnetic tail is determined by convection of force tubes from the magnetic barrier, where the solar-wind plasma is replaced by ions of planetary origin. The possible role of anomalous ionization in the interaction of the solar wind and Venus is examined. (28 refs.)

69522 Reply to the critique of Reasenberg and Bills on 'Elastic thickness of the Venus lithosphere estimated from topography and gravity'. A.Cazenave, K.Dominh (Groupe de Recherche de Geodesie Spatiale, Centre Nat. d'Etudes Spatiales, Toulouse, France).
Geophys. Res. Lett. (USA), vol.10, no.3, p.196-8 (March 1983).
For original see ibid., vol.10, no.1, p.93-6 (1983). The authors re-examine their earlier conclusions (Cazenave and Dominh, ibid., vol.8, p.1039-42, 1981), namely that the lithosphere of Venus may partially support moderate topographic features located in the rolling plains province and that the elastic thickness of the lithosphere in that province is of the order of 10 km, in the light of the arguments of Reasenberg and Bills (1983), who find an elastic thickness of about 120 km. They conclude that the results of Cazenave and Dominh (1981) are compatible with the data used, and that even the more refined topographic and gravity data published by Reasenberg et al. (1981) cannot support the conclusions drawn by Reasenberg and Bills (1983). (7 refs.)

69523 Atomic oxygen emissions observed from Pioneer Venus. R.R.Meier, D.E.Anderson,Jr. (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), A.I.F.Stewart.
Geophys. Res. Lett. (USA), vol.10, no.3, p.214-17 (March 1983).
Atomic oxygen features at 1304 and 1356 Å detected by the Orbiting Ultraviolet Spectrometer (OUVS) on Pioneer Venus are compared to theoretical emission models. Limb scans from three orbits of the O I 1304 Å emission were analyzed using an improved model which removes the restrictive assumptions of complete frequency redistribution and isothermal multiple scattering. Data-model comparisons indicate the OI 1304 Å emission rates observed are consistent with an O density 40% of the DUS model. It is also found that the emission at 1356 Å is consistent with the sum of the CO fourth positive band at 1352 Å and the O I doublet at 1356, 1358 Å, if an O density equal to 40% of the BUS model is used to calculate the O I emission rate. (21 refs.)

69524 Sulfur trioxide in the lower atmosphere of Venus?. R.A.Craig, R.T.Reynolds, B.Ragent, G.C.Carle, F.Woeller, J.B.Pollack (NASA, Ames Res. Center, Moffett Field, CA, USA).
Icarus (USA), vol.53, no.1, p.1-9 (Jan. 1983).
Measurements of Venus' atmospheric composition taken during the Pioneer Venus and Venera missions are reexamined within the context of thermodynamic equilibrium in the lower atmosphere. The implications of several atmospheric descriptions which assume that selected subsets of data are correct are investigated. One of these scenarios, assuming that the O_2 and SO_2 concentrations reported by the Pioneer Venus gas chromatograph are correct and that the H_2O concentrations reported by Venera 11 are correct, leads to the interesting possibility that large concentrations of SO_3 are present in the lower atmosphere. Such quantities of SO_3, however, lead to difficulties in explaining the atmosphere at and above the cloud tops as well as requiring specific assumptions regarding chemical reaction rates at and near the surface. (24 refs.)

69525 The clouds of Venus: sulfuric acid by the lead chamber process. G.T.Sill (Lunar & Planetary Lab., Univ. of Arizona, Tucson, AZ, USA).
Icarus (USA), vol.53, no.1, p.10-17 (Jan. 1983).
The Pioneer Venus atmospheric probe provided new data on the clouds of Venus. A model consistent with these data involves SO_2 being oxidized to H_2SO_4 by NO_x in the presence of H_2O. NO_x also forms nitrosylsulfuric acid ($NOHSO_4$) dissolved in the H_2SO_4 droplets. This acid solution, along with SO_2 and perhaps NO_2, can explain the UV and visible reflection spectrum of Venus. In the middle and lower clouds $NOHSO_4$ forms solid particles. (30 refs.)

69526 Venus: mesospheric hazes of ice, dust, and acid aerosols. R.P.Turco (R&D Associates, Marina del Rey, CA, USA), O.B.Toon, R.C.Whitten, R.G.Keesee.
Icarus (USA), vol.53, no.1, p.18-25 (Jan. 1983).
Speculates on the origin and physical properties of haze in the upper atmosphere of Venus. It is argued that at least four distinct types of particles may be present. The densest and lowest haze, normally seen by spacecraft, probably consists of a submicron sulfuric acid aerosol which extends above the cloud tops (at ~70 km) up to ~80 km; this haze represents an extension of the upper cloud deck. Measurements of the temperature structure between 70 and 120 km indicate that two independent water ice layers may occasionally appear. The lower one can form between 80 and 100 km and is probably the detached haze layer seen in high-contrast limb photography. This ice layer is likely to be nucleated on sulfuric acid aerosols, and is analogous to the nacreous (stratospheric) clouds on Earth. At the Venus 'mesopause' near 120 km, temperatures are frequently cold enough to allow ice nucleation on meteoric dust or ambient ions. The resulting haze is expected to be extremely tenuous, and optically invisible. (30 refs.)

69527 Global characteristics of magnetic flux ropes in the Venus ionosphere. R.C.Elphic, C.T.Russell (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.2993-3003 (1 April 1983).
These flux ropes are the most common magnetic feature of the ionosphere, being observed on more than 70% of the orbits of the Pioneer Venus orbiter passing through the dayside ionosphere. The spatial occurrence of flux ropes maximizes at altitudes near 165 km; they may occupy more than 50% of the ionospheric volume at this altitude. At higher altitudes the fractional volume occupied by ropes decreases below 20%. Characteristic radii of the ropes vary between 6 km at 160 km altitude and 15 km at 500 km altitude, and scale roughly with both the local ion gyroradius and ion inertial length. Ropes above 200 km altitude in the low zenith angle regions ($\chi<45°$) appear to have quasi-horizontal orientations, while those below 2100 km tend to be quasi-vertical. The authors describe other aspects of the flux ropes. (12 refs.)

69528 Venus' nighttime horizontal plasma flow, 'magnetic congestion', and ionospheric hole production. J.M.Grebowsky, H.G.Mayr, S.A.Curtis, H.A.Taylor,Jr. (Lab. for Planetary Atmospheres, NASA Goddard Space Flight Center, Greenbelt, MD, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3005-12 (1 April 1983).
A persistent feature of the nightside Venus ionosphere is the existence of localized magnetic field aligned columns of depleted ionization—i.e. 'holes'—in which the radial component of the field is enhanced. By analogy to the Earth's auroral regions it has been inferred that parallel electric fields can rapidly deplete the ionization. Another, complementary plasma loss mechanism at night is downward transport into the lower ionosphere where chemical depletion occurs. A simple rectilinear two dimensional MHD model is used to explore the effects of field aligned plasma loss and cooling on a dense plasma convecting across a weak magnetic field. (14 refs.)

Convective thinning of the lithosphere: a mechanism for rifting and mid-plate volcanism on Earth, Venus, and Mars ....See Entry 69174

Atomic carbon in the atmospheres of Mars and Venus ....See Entry 69529

96.30G Mars

69529 Atomic carbon in the atmospheres of Mars and Venus. V.A.Krasnopol'skii.
Cosmic Res. (USA), vol.20, no.4, p.430-7 (July-Aug. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.4, p.595-603 (July-Aug. 1982). [received: April 1983]
Calculates the processes for forming C in the ground state and the excited state which gives emission at 1657 Å. These processes are more efficient in CO than in CO_2. The solar radiation flux is 4.5 times greater at Venus than at Mars, leading to a higher concentration of CO and an even greater disparity in the C concentrations. Saturation effects occur during resonance scattering at 1657 Å. Excitation processes during the formation of C give the main contribution to the emission. (31 refs.)

69530 The surface of Mars: a post-Viking view. M.H.Carr.
Mercury (USA), vol.12, no.1, p.2-15 (Jan.-Feb. 1983).
The author examines present conditions on Mars and their possible influence on geological processes, and then discusses the geology of the Martian surface in the light of the results obtained by the Viking spacecraft. It is concluded that Mars resembles the Earth in many ways, but that the two planets differ in the extent of crustal mobility and in the presence of abundant liquid water on Earth. Owing to the lack of crustal mobility and the slow rates of erosion and deposition, Mars is an active planet with enormous surface relief on which features with a wide range of ages are preserved in almost their original condition. (no refs.)

69531 Thermal radiative effects of atmospheric dust in the initiation of Martian Great Duststorms. S.B.Idso (Atmospheric Sci. Div., Inst. for Biospheric Res., Tempe, AZ, USA).
Speculations Sci. & Technol. (Switzerland), vol.6, no.1, p.65-8 (April 1983).
Results from experiments conducted on Earth are cited as evidence for the likelihood that the 'thermal blanketing' phenomenon of atmospheric dust should also be operative on Mars. It is then shown how this tendency for initial atmospheric dustiness to elevate surface temperatures may play a crucial role in the triggering of Martian Great Duststorms. (23 refs.)

Convective thinning of the lithosphere: a mechanism for rifting and mid-plate volcanism on Earth, Venus, and Mars ....See Entry 69174

96.30H Asteroids

69532 Speckle interferometry observations of the asteroids Juno and Amphitrite. G.Baier, G.Weigelt (Phys. Inst., Univ. Erlangen, Erlangen, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.137-41 (May 1983).
Performs digital speckle interferometry of the asteroids Juno and Amphitrite. The speckle interferograms were recorded with the Danish 1.5 m telescope at the European Southern Observatory. The measurements show that both asteroids have elliptical shapes. The diameters of Juno were measured to be 230 km±20 km (0".26) and 288 km±20 km (0.32") (24 December 1979, 6^h10^mUT), the diameters of Amphitrite were 160 km±30 km (0.11") and 255 km±30 km (0.17") (4 April 1981, 8^h30^mUT). (9 refs.)

69533 Positions of minor planets. M.Gressmann (Sternwarte Falkensee, Falkensee-Finkenkrug, Germany).
Astron. Nachr. (Germany), vol.304, no.1, p.55-7 (1983). In German.
Presents topocentric positions of 22 minor planets form Falkensee, GDR. The coordinates are given for the epoch 1950.0. (2 refs.)

96.30K Jupiter

69534 Rocket detection of ultraviolet emission from neutral oxygen and sulfur in the IO torus. S.T.Durrance, P.D.Feldman, H.A.Weaver (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L125-9 (15 April 1983).
Ultraviolet spectra (1150+1750 Å) of the Io plasma torus were obtained using a rocket-borne telescope and spectrometer in 1981 May. Separate spectra of the torus and terrestrial airglow emissions were acquired simultaneously to facilitate accurate background subtraction. Two emissions of the neutral component of the torus are identified: the S I (^3P-^3D) multiplet at 1425 Å, with a brightness (averaged over the 15"×110" aperture) of 2.5±1.3 R; and an emission feature at 1304 Å, with a brightness of 4.2±2.0 R, assigned to both the O I (^3P-^3S) and S I (^3P-^3P) multiplets in the ratio O I:S I≈2:1. This is the first detection of S I as a component of the torus. The instrument field of view intersected the torus near its eastern ansa while Io was near western elongation, so this measurement indicates that an extended neutral atomic cloud is associated with the torus. Also identified are the ionic emissions of S II λ1256 (4.5±1.6 R), S III λ1199 (15±8 R), and S IV λ1406 (2.0±1.0 R). The strong feature at 1729 Å, first observed by the International Ultraviolet Explorer and tentatively as S III, has a brightness of 17.3±4.0 R. (21 refs.)

69535 Dawn-dusk electric field asymmetry of the Io plasma torus. D.D.Barbosa, M.G.Kivelson (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).
Geophys. Res. Lett. (USA), vol.10, no.3, p.210-13 (March 1983).
The authors consider the effects of a combined convection and corotation electric field across to the Io plasma torus. A dawn-to-dusk electric field E_c will modify the orbits of charged particles shifting them toward dawn. The radial drift imposed by the perturbed orbits implies a local time-dependent modulation of low-energy ion and electron temperatures with particles hotter at dusk than at dawn. With $E_c \simeq 4$ mV/m, the orbits near 6 R_J would be shifted by approximately 0.2 R_J. Then the electron temperature would be 20% higher at dusk than at dawn, an effect which could explain the local time asymmetry of EUV intensity found by the Voyager ultraviolet spectrometer. The source of the convection electric field is internal to the magnetosphere and is attributed to the tailward escape of Iogenic and Jovian plasma beyond the Alfven surface. (18 refs.)

69536 Orbital evolution of the Galilean satellites: capture into resonance. J.Henrard (Dept. of Math., Facultes Univ. Notre-Dame de la Paix, Namur, Belgium).
Icarus (USA), vol.53, no.1, p.55-67 (Jan. 1983).
Yoder's scenario (1979) for the capture into resonance of the first three Galilean satellites is reexamined. A more refined dynamical model for the resonance and for the tidal effects is proposed and analyzed. The results agree qualitatively with those of Yoder but differ numerically by 10 to 20%. (9 refs.)

69537 The $^{12}C/^{13}C$ ratio in Jupiter from the Voyager infrared investigation. R.Courtin (Lab. de Phys. Stellaire et Planetaire, Verrieres-le-Buisson, France), D.Gautier, A.Marten, V.Kunde.
Icarus (USA), vol.53, no.1, p.121-32 (Jan. 1983).
The $^{12}C/^{13}C$ ratio in Jupiter has been derived from that analysis of the ν_4 band of CH_4 in the spectra recorded by the Voyager 1 IRIS experiment. It is found to be 160_{-55}^{+40}. Instrumental noise as well as systematic sources of error were taken into account for the estimate of the uncertainty. No plausible theory predicts such a difference as there is between the values of the $^{12}C/^{13}C$ ratio in the inner Solar System and in Jupiter. However, values of this ratio in the solar neighborhood 4.5 by ago inferred—through the use of models of chemical evolution of the Galaxy—from recent interstellar medium measurements are compatible with the present determination in Jupiter. The Jovian value, rather than the terrestrial one, could then be representative of the ratio of the primitive solar nebula. (47 refs.)

69538 Further observations of 8-μm polar brightenings of Jupiter. J.Caldwell, A.T.Tokunaga (Inst. for Astron., Univ. of Hawaii, Honolulu, HI, USA), G.S.Orton.
Icarus (USA), vol.53, no.1, p.133-40 (Jan. 1983).
North to south scans of Jupiter at 7.8-μm wavelength in early 1981 confirm polar brightening events that correlate with LCM_{III}, such that a polar limb is bright when the corresponding magnetic pole is tilted earthward. The correlation with magnetic features of the planet suggests that the energy source for the brightenings is magnetospheric particles incident upon the polar regions of the atmosphere. The northern polar events are more prominent and more regular than the southern ones. The polar emission may be indirectly related to the ultraviolet absorber observed near the poles by Voyager 2. (8 refs.)

69539 Alfven wave propagation in the Io plasma torus. F.Bagenal (Center for Space Res., MIT, Cambridge, MA, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3013-25 (1 April 1983).
Plasma measurements that were made by the Voyager 1 plasma science experiment have been combined with a model of Jupiter's magnetic field to calculate the time an Alfven wave takes to travel between Io and Jupiter's ionosphere and the period of subsequent bounces between the northern and southern hemispheres. The result is a wave pattern extending around Jupiter as the multiple reflected Alfven waves are carried away from Io by the corotating magnetospheric plasma. Although the whole pattern continually changes over the 13 hours Io takes to move through 360° of Jovigraphic longitude, a general longitudinal structure is exhibited independent of the position of Io, due to the geometry of the magnetic field and the distribution of plasma in the Io torus. (34 refs.)

69540 Kelvin-Helmholtz instability and the Jovian Great Red Spot. M.V.Nezlin, E.N.Snezhkin, A.S.Trubnikov (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
JETP Lett. (USA), vol.36, no.6, p.234-8 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.190-3 (20 Sept. 1982). [received: April 1983]
It has been shown experimentally, for the first time, that the Kelvin-Helmholtz instability is manifested by a predominant generation of anticyclonic Rossby solitons in a model of a homogeneous atmosphere of a rotating planet. These solitons drift opposite the global rotation. Their properties and the conditions for their existence are reminiscent of the vortex at the Jovian Great Red Spot. (10 refs.)

96.30M Saturn

69541 On the equatorial transport of Saturn's ionosphere as driven by a dust-ring current system. W.-H.Ip (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany), D.A.Mendis.
Geophys. Res. Lett. (USA), vol.10, no.3, p.207-9 (March 1983).
The diurnal modulation of the dust ring current of Saturn's D-ring causes field-aligned Birkeland currents to flow near the dawn and dusk terminators and close across the mid-latitude ionosphere. One consequence of this current system is the establishment of a global convection pattern in the equatorial outer ionosphere. Outward motion of the dayside ionospheric plasma as well as the corresponding absorption effect of the inner ring system might be one physical cause of the depletion of the ionospheric content of Saturn. (15 refs.)

69542 The dark side of Iapetus. D.P.Cruikshank (Inst. for Astron., Univ. of Hawaii, Honolulu, HI, USA), J.F.Bell, M.J.Gaffey, R.Hamilton Brown, R.Howell, C.Beerman, M.Rognstad.
Icarus (USA), vol.53, no.1, p.90-104 (Jan. 1983).
Presents new photometric and spectrophotometric observations of the dark (leading) hemisphere of Saturn's satellite Iapetus. Spectrophotometry from 0.3-1.0 μm (May 1979) shows the dark hemisphere to be very red, similar to a few asteroids and the Moon, but with no spectral features attributable to olivine or pyroxene. Near-infrared spectrophotometry in the regions 1.4-2.5 μm (May 1981) and 3.0-3.8 μm (February 1981) reveals water ice absorption bands, probably resulting from the polar caps intruding onto the dark hemisphere. The reflectance of Iapetus most closely resembles the reflectance (and low albedo) of carbonaceous (organic) residue from the Murchison C2 carbonaceous chondrite. Three hypotheses for the formation of the dark hemisphere are discussed in light of the observational data. The favored hypothesis is that debris from Phoebe or other unknown outer satellites of Saturn impacts the dark hemisphere of Iapetus as Poynting-Robertson drag causes the debris to spiral toward Saturn. (51 refs.)

69543 Viscosity of the lithosphere of Enceladus. Q.R.Passey (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).
Icarus (USA), vol.53, no.1, p.105-20 (Jan. 1983).
High resolution Voyager II images of Enceladus reveal that some regions on its surface are highly cratered; the most heavily cratered surfaces probably date back to a period of heavy bombardment. The forms of many of the craters on Enceladus are similar to those of fresh lunar craters, but many of the craters are much shallower to depth, and the floors of some craters are bowed up. The flattening of craters and bowing up of the floors are indicative of viscous relaxation of the topography. The flattened craters are located in distinct zones that are adjacent to zones, of similar age, where craters have not flattened. The zones where flattened craters occur possibly are regions in which the heat flow was (or is) higher than that in the adjacent terrains. It can be concluded that the lithospheric material on Enceladus is different from that of Ganymede and Callisto. (20 refs.)

69544 Orbits of Saturn's F ring and its shepherding satellites. S.P.Synnott, R.J.Terrile, R.A.Jacobson (Jet Propulsion Lab., Pasadena, CA, USA), B.A.Smith.
Icarus (USA), vol.53, no.1, p.156-8 (Jan. 1983).
The shape and orientation of Saturn's F ring and the orbits of its two shepherding satellites have been determined from Voyager images. The data and processing are described, and orbital parameter estimates and associated uncertainties are presented. In addition, evidence that suggests that the F-ring braids are formed very near the conjunctions of the shepherding satellites is presented. (4 refs.)

69545 Atmospheric storm explanation of Saturnian electrostatic discharges. M.L.Kaiser, J.E.P.Connerney, M.D.Desch (Goddard Space Flight Center, NASA, Greenbelt, MD, USA).
Nature (GB), vol.303, no.5912, p.50-3 (5 May 1983).
The Voyager Planetary Radio Astronomy (PRA) experiments detected an impulsive (15-400 ms), broadband (20 kHz to 40 MHz) radio emission component that persisted throughout the two Saturn encounter periods. These bursts were grouped into episodes which recurred with a period of about 10 h 10 min, distinctly faster than the Saturnian rotation period of 10 h 39.4 min. This periodicity, coupled with the occurrence dependence on distance rom Saturn, led Warwick et al. (1981, 1982) to conclude that the bursts were related to the Saturn system and coined the term SED for Saturn electrostatic discharges. The authors analyse these SED episodes paying particular attention to their occurrence in both time and frequency as a function of spacecraft-Saturn geometry during the Voyager 1 encounter. From the model, the authors infer the ionospheric electron density near Saturn's noon meridian and over the night hemisphere. (16 refs.)

96.30T Other planets

69546 New observational constraints on the temperature inversions of Uranus and Neptune. A.T.Tokunaga (Inst. for Astron., Univ. of Hawaii, Honolulu, HI, USA), G.S.Orton, J.Caldwell.
Icarus (USA), vol.53, no.1, p.141-6 (Jan. 1983).
Presents 20-μm photometry of Uranus and Neptune which confirms the presence of a temperature inversion in the lower stratospheres in both planets. The authors find the brightness temperature difference between 17.8 and 19.6 μm to be 0.8 ± 0.5K for Uranus and 1.8 ± 0.6K for Neptune. These results indicate that the temperature inversions on both planets are weaker than previously thought. Comparison with model atmospheres by Appleby (1980) indicates that the temperature inversions can be understood as arising from heating by the absorption of sunlight by CH_4 and aerosols. However, the stratospheric CH_4 mixing ratio on Neptune must be higher than that at the temperature minimum. (25 refs.)

69547 Extraterrestrial Lyman α and helium 584 Å resonance radiation from the near solar system. A.Rea.
Univ. Wales, Swansea thesis, Sept. 1982
Critically reviews observations and theoretical work concerning hydrogen Lyman α and helium 584 Å emissions from interplanetary space. The subject is treated in detail from the early exploratory stage to the present day. A description of the experimental apparatus and methods of data analysis is given.

96.50G Comets

69548 Astrometry and photometry of comet P/Halley in October and November 1982. B.Sicardy, J.Guerin, J.Lecacheux, J.Baudrand, M.Combes (Section d'Astrophys., Obs. de Paris-Meudon, Meudon, France), J.P.Picat, G.Lelievre, J.P.Lemonnier.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.L4-6 (May 1983).
Comet P/Halley (1982i) has been observed at the Canada-France-Hawaii 3.6-m Telescope on October 17th, November 15th and 16th, 1982, using an electronographic camera. Positions were measured with an accuracy of ± 1.5 arc sec. The B-magnitude was 24.6 ± 0.4 in November 1982. Data reduction procedures are presented. A value of the nuclear radius is derived. (9 refs.)

69549 P/Halley: first signs of activity?. R.M.West, H.Pedersen (European Southern Obs., Garching, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.L11-12 (May 1983).
A comparison of two broad-band CCD exposures (3700-7800 Å) of P/Halley (1982i) on 10 December 1982 and 14 January 1983, with the Danish 1.5 m telescope on La Silla, indicates a brightness increase of $1.0^m \pm 0.4^m$. The January image is broader than the seeing disc, although this may partly be a guiding effect. It is possible that the first signs of nuclear activity have been observed at $\sim$10.5 AU. Accurate positions have been measured. (8 refs.)

69550 Electrodynamics of submicron dust in the cometary coma. M.K.Wallis, M.H.A.Hassan (Dept. of Appl. Maths. & Astron., Univ. Coll. of Cardiff, Cardiff, Wales).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.10-14 (May 1983).
Electromagnetic forces derived from the solar wind fields act strongly on submicron dust grains in the cometary coma. The grain charge and thus the forces are sensitive to composition and cometary plasma conditions, as well as to grain size. For dielectric grains of 0.1 μm and conducting grains of 0.3 μm or less, the electromagnetic forces dominate over radiation pressure. The stronger accelerations may produce fan-like structures as sometimes observed. They would also cause grains to circumvent the shields designed to protect the Giotto and Vega spacecraft speeding through comet Halley's dust coma. (29 refs.)

69551 New Comet IRAS-Araki-Alcock 1983d. S.W.Milbourn.
Br. Astron. Assoc. Circ. (GB), no.634, 1 pp. (9 May 1983).
It is reported that a large, diffuse comet was discovered on 1983 April 25 by the IRAS satellite and independently on 1983 May 3 by C. Araki and G.E.D. Alcock. A very close approach to the Earth is predicted for May 11-12, with a minimum distance of 0.03 AU; at this time the magnitude of the comet will be around +2, and its diameter is expected to exceed 1°. Parabolic orbital elements are given for the comet, together with an ephemeris for the period 1983 May 5 to 21, at one-day intervals. (no refs.)

69552 Periodic Comet Tempel 2 (1982d). D.W.E.Green.
I.A.U. Circ. (USA), no.3794, 1 pp. (29 April 1983).
An ephemeris is presented for the period 1983 May 6 to September 23, at ten-day intervals. (2 refs.)

69553 Comet IRAS-Araki-Alcock (1983d).
I.A.U. Circ. (USA), no.3796, 1 pp. (4 May 1983).
It is reported that a large, bright comet was discovered on 1983 April 25 by the IRAS satellite and independently on May 3 by Genichi Araki and G.E.D. Alcock. Twelve positions are reported for the period 1983 April 25 to May 4; these include five precise positions measured on April 27 and May 2. The comet brightened from 7th to 6th magnitude between May 3 and May 4; its diameter on May 4 was 18′. (no refs.)

69554 Comet IRAS-Araki-Alcock (1983d). B.G.Marsden.
I.A.U. Circ. (USA), no.3797, 1 pp. (4 May 1983).
The author reports parabolic orbital elements for this comet together with an ephemeris for the period 1983 May 4 to 8 (at one-day intervals) and for the period 1983 May 8 to 16 (at half-day intervals). It is predicted that the comet will approach to within 0.034 a.u. of the Earth on 1983 May 11, and that it will reach magnitude 2.2 at this time. (no refs.)

69555 Periodic Comet Kopff (1982k). J.-C.Merlin, J.Bortle, C.S.Morris.
I.A.U. Circ. (USA), no.3797, 1 pp. (4 May 1983).
Total visual magnitude estimates are reported for the period 1983 March 20 to April 18; the comet brightened from magnitude 12.7 to magnitude 10.9 during the period of the observations. (no refs.)

69556 Comet IRAS-Araki-Alcock (1983d). T.Oja, G.Hahn, R.McNaught, K.Ishida, P.Stattmayer, G.Bothun, J.Patterson, D.W.E.Green.
I.A.U. Circ. (USA), no.3804, 1 pp. (11 May 1983).
27 precise positions are reported, covering the period 1983 May 1 to 11. (no refs.)

69557 Comet IRAS-Araki-Alcock (1983d). R.P.Boyle, B.L.Lutz, R.M.Wagner, R.McNaught, D.Machholz, D.W.E.Green, B.G.Marsden.
I.A.U. Circ. (USA), no.3805, 1 pp. (11 May 1983).
It is reported that polarimetric observations of Comet IRAS-Araki-Alcock on 1983 May 5 and 6 showed the linear polarisation to be 25% in V, R and I, and somewhat less in U and B; observations using a narrow-band (5 nm) filter at 385 nm gave a linear polarisation of 13%. Spatially-resolved spectrophotometric observations between 380 and 640 nm, also on 1983 May 5 and 6, showed the coma to exhibit the characteristic emission features of CN, C_3, C_2, NH_2, and [O I]. The nuclear region, which appeared highly condensed, showed a strong reflective continuum superimposed on the gaseous emissions. Naked-eye estimates of total magnitude and coma diameter are presented for the period 1983 May 9 to 11. Finally, improved parabolic orbital elements are given, together with an ephemeris for the period 1983 May 16 to June 25, at five-day intervals. (no refs.)

69558 Comet Sugano-Saigusa-Fujikawa (1983e). E.Everhart, B.Skiff, C.Lugenbuhl, M.Koishikawa, E.Mayer, J.Young, R.Oster, D.Machholz.
I.A.U. Circ. (USA), no.3807, 1 pp. (11 May 1983).
The authors report three precise positions for the epoch 1983 May 9 and three approximate positions for 1983 May 10. (1 ref.)

69559 Periodic Comet Tempel 1 (1982j). J.-C.Merlin, C.E.Spratt, J.Bortle.
I.A.U. Circ. (USA), no.3807, 1 pp. (11 May 1983).
Total visual magnitude estimates are reported for the period 1983 April 13 to May 5; the comet brightened from magnitude 10.8 to magnitude 9.5 during the period of the observations. (no refs.)

Meteoroid cluster produced by Halley's Comet ....See Entry 69562

96.50K Meteors, showers and meteoroids

69560 New aspects in single-body meteor physics. P.Pecina, Z.Ceplecha (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.102-21 (March 1983).
Integration of the single-body differential equations of motion and ablation of a meteoroid in the atmosphere (Hoppe, 1937) with constant coefficients result in an analytical expression for the distance along the trajectory as a function of time. Initial and terminal velocities, and a value of the average ablation coefficient for the entire trajectory are determined. Expressions at the maximum-deceleration point are given and applied to compute ablation coefficients for 17 Prairie Network fireballs observed below this point and for the Innisfree fireball. A model of luminous efficiencies for small velocities and for masses up to several hundred grams is proposed and applied to separate the shape-density coefficient from the meteoroid mass. (17 refs.)

69561 Dependence of the observed rate of meteors on the zenith distance of the radiant. J.Zvolankova (Astron. Inst., Acad. of Sci., Bratislava, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.122-8 (March 1983).
Using more than 17000 visual records of the Perseids made at the Skalnate Pleso Observatory over a period of 9 years, the exponent γ in the reduction factor $\cos^{\gamma} z$ is derived for reducing the rate of meteors observed at zenith distance of the radiation z to the rate when the radiant is in the zenith. The value of the exponent thus obtained, $\gamma=1.47\pm0.11$, is very close to the average of the extremes used, $\gamma=1$ and $\gamma=2$. (16 refs.)

69562 Meteoroid cluster produced by Halley's Comet. A.N.Simonenko.
Priroda (USSR), no.2, p.28-35 (1983). In Russian.
A study is made of the very rarefied closed elliptical cluster of meteoroids located along the orbit of Periodic Comet Halley. The process of cluster formation is analysed and the question of the actual composition of the meteoroids is considered, with comments on research to date. The Comet Halley cluster is singled out for special study as a cluster with two meteor showers (the May Aquarids and the Orionids) and the evolution of the orbit of the comet is traced with details of old and future observations of the meteor showers. (4 refs.) *L.M.H.*

69563 Isotopic anomalies: early history of the Solar System. P.Bochsler (Phys. Inst., Univ. of Bern, Bern, Switzerland).
Europhys. News (Switzerland), vol.14, no.2, p.1-3 (Feb. 1983).
Outlines the results of isotopic composition analysis on the ALLENDE meteorite, which fell in 1969. (3 refs.)

69564 Extraterrestrials have landed on Antarctica. U.B.Marvin (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
New Sci. (GB), vol.97, no.1349, p.710-15 (17 March 1983).
Within the past decade the thick ice sheet that covers Antarctica has yielded more than 5000 fragments of meteorite. The vast majority are specimens of stony meteorites, types already abundant in the world's museums; but a few have proved to be entirely new species. In addition, about 36 fragments of metallic nickel-iron meteorites have been collected, one of which contains minute diamonds, and is only the second of its kind known in the world. Indeed, the ice sheet's frozen cargo may include meteorite specimens derived not only from the fragmentation of asteroids and possibly of comets but also from the Moon and Mars. Results of preliminary studies on a meteorite found by a US party in the final days of its 1981-82 expedition to Antarctica are discussed. The 31-gram specimen, about the size of an apricot, has properties in common with 'soils' from the lunar highlands. If the evidence proves conclusive, this will be the first piece of the Moon ever found on Earth. In addition, new data strengthen the idea that a group of nine unusual stony meteorites may have come from Mars. Two of the specimens were found in Antarctica, and one each in Egypt, France, Brazil, the US, Nigeria, India and Australia. Thus, years after the US and the USSR last sent space probes to the Moon to gather rock samples, a rich harvest of exciting new examples from space is turning up on Earth and which often raise more questions than they answer. (no refs.)

96.60 SOLAR PHYSICS

69565 OSO-8 observations of a quiescent prominence: a comparison of Lyman-α with theoretical intensities. P.Heinzel (Astron. Inst., Czechoslovak. Acad. of Sci., Ondrejov, Czechoslovakia), J.-C.Vial.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.155-7 (May 1983).
Using simultaneous observations of hydrogen Lyman-α and Ca II K lines obtained with the OSO 8 LPSP instrument, the authors compare Lα emission from a quiescent prominence with those predicted from the existing theoretical models. The authors use the observed relation between Hα and Ca II K integrated intensities to obtain an estimate of $E(\mathrm{H}\alpha)/E(\mathrm{L}\alpha)$ vs. $E(\mathrm{H}\alpha)$. This ratio differs significantly from those predicted theoretically under the assumption of complete frequency redistribution during the scattering of Lα photons. On the other hand, using the partial-redistribution treatment in the Lα wings, as suggested for prominences by Miley et al. (1979), the authors arrived at a reasonable agreement with the corresponding theoretical curve. The possible influence of macroscopic velocities on line ratios is briefly discussed. (19 refs.)

69566 Observable physical effects during new solar active regions formation. V.Bumba (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).
Astron. Nachr. (Germany), vol.304, no.1, p.7-12 (1983).
Demonstrates the importance of detailed observations for the theory of solar local magnetic field generation. Mutual relations between solar background magnetic fields and new active regions formation are described. The influence of various factors on the cycle of solar activity and the dynamics of background fields is considered. All forces and effects whose action can be derived from systematic observations of magnetic field distribution and high resolution photospheric photographs of all stages of active region development are discussed. The influence of convection, field lines penetration, various magnetic forces, differential rotation and hydrodynamical forces is demonstrated. The importance of a 'center of magnetic activity' as a source of new magnetic flux is underlined. The necessity of a new approach to the problem of local magnetic field generation is stated. (22 refs.)

69567 Coronal index of solar activity. IV. Years 1964-1970 [with comment]. M.Rybansky, V.Rusin, J.Sykora (Astron. Inst., Slovak Acad. of Sci., Lomnica, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.79-96 (March 1983).
For pt.III see ibid., vol.30, no.2, p.104-13 (1978). Reports the values of the coronal index of solar activity for the years 1964-1970, determined using the method described by Rybansky (1975). The index is expressed in terms of the total energy emitted by the whole visible corona in emission line Fe XIV$-$530.3 nm. A graph showing the behaviour of the index during the 20th cycle of solar activity (monthly averages) is given. (7 refs.)

69568 The motions of the umbrae in Hale Active Regions 16862 and 16.863. A.Antalova (Astron. Inst., Slovak Acad. of Sci., Lomnica, Czechoslovakia).
Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.2, p.96-9 (March 1983).
Substantial changes of the orientations of the geometrical axis of the umbra of the Hale AR 16863 was observed from 22 to 24 May 1980. The average angular velocity was -1.8 degree per hour. The axes of the both main umbrae of the AR 167862 also rotated after 24 May 1980. These spots were preferred locations of the umbral subflares. (1 ref.)

69569 The great solar anomaly ca. 1780-1800: an error in compiling the record?. G.P.Sonett (Planetary Sci. Dept., Univ. of Arizona, Tucson, AZ, USA).
J. Geophys. Res. (USA), vol.88, no.A4, p.3225-8 (1 April 1983).
The view that the sunspot index time sequence is of lessened validity prior to about 1850 is shown to be consistent with an error in the 1780-1800 time period when phase, offset of the Hale carrier sinusoid from zero mean, and the amplitude modulation envelope all show a lack of conformity with respect to the remainder of the record subsequent to the Maunder minimum. This lack of conformity is consistent with an error that delays one or more of the 11-year cycle minima but recovers phase subsequently. This type of error creates a strongly coherent set of companion changes in offset of the carrier from zero mean and in the amplitude modulation envelope. (12 refs.)

69570 Thermal balance and magnetostatic equilibrium in a uniform gravity field. Wang Shui (Univ. of Sci. & Technol. of China, Hefei, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.11, p.1163-6 (Nov. 1982). [received: April 1983]
The equation of magnetostatic equilibrium of a plasma in a uniform gravity field is applied widely in solar physics. Many phenomena in the solar atmosphere such as sunspots, quiescent prominences and various other chromospheric, and coronal structures can last several hours to several days. In the solar atmosphere, the energy transport produced by thermal conduction, radiative loss and heat source (for example, heat from the dissipation of waves) are very important. The author derives the general form of the couple equation between the temperature field and the magnetic field, and also obtains the self-consistent solutions of thermal balance and magnetostatic equilibrium of a 2-dimensional plasma in a uniform gravity field. (7 refs.)

69571 Principal and dielectronic satellite line spectra for Ca XIX: SMM observations. A.K.Pradhan (Dept. of Phys., Univ. of Windsor, Windsor, Ontario, Canada).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.35p-8 (May 1983).
Atomic processes and data relevant to the interpretation of SMM observations of Ca XIX are discussed, with particular reference to the work by Bely-Dubau et al. (1982). (15 refs.)

69572 Has rapid solar core rotation been observed?. B.N.Andersen, P.Maltby (Inst. of Theoretical Astrophys., Univ. of Oslo, Oslo, Norway).
Nature (GB), vol.302, no.5911, p.808-10 (28 April 1983).
Shows that the phase as well as the magnitude of the observed 13.1 ± 0.2 day velocity signal amplitude may be predicted without any rapid core rotation by taking into account the presence of sunspots and their contribution to the spectral line profile as integrated over the disk of the Sun. It is concluded that the existence of a 13.1-day apparently periodic velocity signal with amplitude 6.5 m s^{-1} during the 88 days observing period cannot be taken as evidence for a rapidly rotating solar core. (11 refs.)

69573 Solar atmospheric temperature inhomogeneities induce a 13-day oscillation in full-disk Doppler measurements. M.G.Edmunds (Dept. of Appl. Math. & Astron., Univ. Coll. Cardiff, Cardiff, Wales), D.O.Gough.
Nature (GB), vol.302, no.5911, p.810-12 (28 April 1983).
Points out that the passage of active regions across the disk could be responsible for a 13-day oscillation in full-disk solar spectrum-line shifts. Variations in line shifts and in irradiance are expected with frequencies comparable to both the photospheric rotation rate and to higher harmonics. For line-shift oscillations the power in the second harmonic is substantially greater than it is for irradiance variations. Therefore a prominent 13-day component is not surprising, especially as the second harmonic is strong in the sunspot distribution. The amplitude, period and phase that would be expected to have been found in line-shift data are estimated. It is suggested that the 13-day oscillation is a direct consequence of the inhomogeneity of the solar surface. (20 refs.)

69574 A mathematical model of solar flares. J.Heyvaerts (Obs. de Meudon, Meudon, France), J.-M.Lasry, M.Schatzman, P.Witomski.
Q. Appl. Math. (USA), vol.41, no.1, p.1-30 (April 1983).
The phenomenon of solar flares is modeled assuming that the magnetic field is force-free and that its evolution is quasi-static. This model is simplified so as to be tractable and yields a semi-linear elliptic equation in a halfplane depending on a parameter λ which describes the time evolution. It is proved that there are (at least) two branches of solutions which have distinct asymptotic behaviors at infinity. The upper branch exists for all $\lambda>0$, but the lower branch exists only on a finite interval $[0,\lambda^c]$. As stable solutions must have the same asymptotic behavior as the lower branch of solutions, and as this is

impossible after λ^c, the authors contend that no stable solution exists after λ^c and that a solar flare is thus triggered. (24 refs.)

69575 On possible correlations in the photospheric magnetic field. S.G.Wallenhorst (Mount Wilson & Las Campanas Obs., Carnegie Inst. of Washington, Washington, DC, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.191-4 (March 1983).
Searches for correlations between photospheric magnetic field changes in the north and south hemispheres of the Sun. Both active region logs and analysis of Mount Wilson magnetograms were employed. No correlations were found, and it is inferred that local convective turbulence is more important than dynamic processes with regard to the appearance of individual active regions. (6 refs.)

69576 Non-axisymmetric magnetostatic equilibrium. I. A perturbation theory. W.R.Hu, Y.Q.Hu, B.C.Low (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.195-205 (March 1983).
Considers the structural properties of a sunspot-like magnetic flux tube which lacks perfect axisymmetry. The flux tube is taken to be in static equilibrium with an atmosphere in a uniform gravity. Assuming the departure from axisymmetry to be slight, the equations for the first order non-axisymmetric part of the equilibrium are derived in cylindrical coordinates. These first order equations reduce to a linear second order hyperbolic partial differential equation in the *r-z* plane. Physical considerations dictate the specifications of boundary conditions on a closed curve. The construction of solutions to this boundary value problem is illustrated with three analytically soluble cases of different complexity. A physical discussion of the results is given. (12 refs.)

69577 A statistical analysis of Na I D_1 profile fluctuations at the center of the solar disk. I. Data reduction and resolvable velocities. F.N.Edmonds,Jr., J.-C.Hsu (Dept. of Astron., Univ. of Texas, Austin, TX, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.217-32 (March 1983).
Three radial-velocity fluctuation arrays $V(\Delta\lambda,Y)$ and line-formation fluctuation arrays $L(\Delta\lambda,Y)$, where $\Delta\lambda$ is wavelength displacement from the center of Na I D_1 and Y is displacement on the Sun's surface along the spectrograph slit, were obtained from Sacramento Peak Observatory spectrograms. The variations of these line profile fluctuations are qualitatively described. The RMS$_v$s, coherences, and power spectra shapes for $V(\Delta\lambda,Y)$ fluctuations are examined at different $\Delta\lambda$ with the corresponding effective heights of formation calculated with Mein weighting functions. (48 refs.)

69578 The solar corona on 31 July, 1981. R.R.Fisher, L.B.Lacey, K.A.Rock, E.A.Yasukawa (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA), N.R.Sheeley,Jr., D.J.Michels, R.A.Howard, M.J.Koomen.
Sol. Phys. (Netherlands), vol.83, no.2, p.233-42 (March 1983).
Various instruments were used to observe the solar corona near or at the time of total eclipse, 31 July, 1981. The High Altitude Observatory coronal eclipse camera and the Mk-III *K*-coronameter recorded the lower portions of the corona; the distribution of white light material above $3R_\odot$ was observed with the Naval Research Laboratory satellite coronagraph on P78-1. These data sets are used to describe coronal structure and to identify coronal active regions. A distribution of the white-light corona, derived from synoptic *K*-coronameter data, is given. (7 refs.)

69579 Analysis of the high-resolution Mg XI X-ray spectra. IV. Derivation of the plasma densities close to the 'low-density' limit. G.Bromboszcz (Astron. Inst., Wroclaw Univ., Wroclaw, Poland), M.Siarkowski, J.Sylwester, V.V.Korneev, S.L.Mandelshtam, S.N.Oparin, A.M.Urnov, I.A.Zhitnik.
Sol. Phys. (Netherlands), vol.83, no.2, p.243-55 (March 1983).
For pt.III see ibid., vol.81, no.1, p.63-8 (1982). A method is developed to evaluate plasma densities from measured resonance, intercombination, and forbidden helium-like Mg XI line intensities, using plots of the so-called *G* and *R* ratios. The density is close to the low-density limit. For the active region McMath 14352 are correlation between mean plasma density and electron temperature has been found, in agreement with earlier results. In an appendix systematic differences between measured and calculated line fluxes in all bands A to F are discussed. (24 refs.)

69580 Optical counterpart of the radio event accompanying 3B flare of 13 May 1981. R.E.Loughhead, Wang Jia-Long (Div. of Appl. Phys., CSIRO, Sydney, Australia), R.A.Duncan.
Sol. Phys. (Netherlands), vol.83, no.2, p.257-66 (March 1983).
Excepting intermittent type III activity, all the radio events over the frequency range 8-8000 MHz accompanying the initial stage of the 3B flare of 13 May 1981 had their onset in a 2-min interval immediately preceding the peak of an impulsive Hα brightening (kernel) well away from the main flare. This kernel is identified as one footpoint of a loop of magnetic flux whose other end terminated in a transient brightening in an adjacent active region. (23 refs.)

69581 X-ray and radio emissions in the early stages of solar flares. A.O.Benz (NASA/ Goddard Space Flight Center, Greenbelt, MD, USA), C.H.Barrow, B.R.Dennis, M.Pick, A.Raoult, G.Simnett.
Sol. Phys. (Netherlands), vol.83, no.2, p.267-83 (March 1983).
Radio and X-ray observations are presented for three flares which show significant activity for several minutes prior to the main impulsive increase in the hard X-ray flux. The activity in this 'pre-flash' phase is investigated using 3.5 to 461 keV X-ray data from the Solar Maximum Mission, 100 to 1000 MHz radio data from Zurich, and 169 MHz radio-heliograph data from Nancay. (21 refs.)

69582 High-resolution observations of solar radio bursts at 2, 6, and 20 cm wavelength. R.F.Willson (Dept. of Phys., Tufts Univ., Medford, MA, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.285-303 (March 1983).
The very large array and the Westerbork synthesis radio telescope have been used to observe eight solar bursts at 2, 6, or 20 cm wavelength with second-of-arc angular resolution. A series of 10 s snapshot maps are presented for the more intense bursts, and superimposed on photospheric magnetograms or Hα photographs. (26 refs.)

69583 Interpretation of patterns of drifting zebra stripes. L.Mollwo (Zentralinst. fur Solar-Terrestrische Phys. (Heinrich-Hertz-Inst.),,Berlin. Akad. der Wissenschaften,Germany).
Sol. Phys. (Netherlands), vol.83, no.2, p.305-20 (March 1983).
The earlier interpretation of the zebra patterns by the concept of double resonance is examined for a realistic magneto-hydrostatic model of a coronal condensation over a bipolar spot group. It appears that the frequency drift of the zebra stripes over a longer time can scarcely be explained by a change of state of the plasma. A modified mechanism is proposed based on a helical beam of electrons forming fronts that excite radiation at places of double resonance. (48 refs.)

69584 Solar rotation results at Mount Wilson. IV. Results. R.Howard, J.M.Adkins, J.E.Boyden, T.A.Cragg, T.S.Gregory, B.J.Labonte, S.P.Padilla, L.Webster (Mount Wilson & Las Campanas Obs., Carnegie Inst. of Washington, Washington, DC, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.321-38 (March 1983).
For pt.III see ibid., vol.80, no.2, p.361-72 (1982). Publish rotation results from Doppler velocity measurements made at Mount Wilson over a period of more than 14 years. Altogether data from 188 rotations are presented. These results are displayed in various tables and figures. Measurements of scattered light along with its effect on the measured rotation rate are shown. (12 refs.)

69585 Relationships between photospheric plasma angular velocity and solar activity. G.Godoli (Cattedra di Fisica Solare, Univ. di Firenze, Firenze, Italy), F.Mazzucconi.
Sol. Phys. (Netherlands), vol.83, no.2, p.339-47 (March 1983).
An analysis of relationships between latitudinal fine structures of the photospheric plasma differential rotation and solar activity shows that sunspot activity seems to be lower (as measured by the number and extension of sunspot groups) at latitudes where minima of angular velocity appear. (7 refs.)

69586 First results from the Clark Lake Multifrequency Radioheliograph [coronal images]. M.R.Kundu, W.C.Erickson, T.E.Gergely, M.J.Mahoney, P.J.Turner (Clark Lake Radio Obs., Univ. of Maryland, College Park, MD, USA).
Sol. Phys. (Netherlands), vol.83, no.2, p.385-9 (March 1983).
Gives a brief description of the Clark Lake Multifrequency Radioheliograph which is being used for solar research in the frequency range 20-125 MHz. The authors present two-dimensional images of the Sun's corona at several frequencies within this range, obtained with time resolution as good as 1.28 s. The shape of the Sun's outer corona as observed at meter-decameter wavelengths appear to change in time periods as short as a few seconds. (5 refs.)

69587 Coronal disturbances and their terrestrial effects. D.M.Rust (American Sci. & Engng. Inc., Cambridge, MA, USA).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.21-36 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Coronal disturbances lead to geomagnetic storms, proton showers, auroras and a wide variety of other phenomena at Earth. Yet, attempts to link interplanetary and terrestrial phenomena to specific varieties of coronal disturbances have achieved only limited success. Here, several recent approaches to prediction of interplanetary consequences of coronal disturbances are reviewed. The relationships of shocks and energetic particles to coronal transients, of proton events to γ-ray bursts, of proton events to microwave bursts, of geomagnetic storms to filament eruptions and of solar wind speed increases to the flare site magnetic field direction are explored. A new phenomenon, transient coronal holes, is discussed. These voids in the corona appear astride the long decay enhancements (LDEs) of 2-50 Å X-ray emission that follow Hα filament eruptions. The transient holes are similar to long-lived coronal holes, which are the sources of high speed solar wind streams. There is some evidence that transient coronal holes are associated with transient solar wind speed increases. (52 refs.)

69588 Plasma-physical aspects of the solar cycle. M.A.Raadu (Dept. of Plasma Phys., Royal Inst. of Technol., Stockholm, Sweden).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.37-45 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Mass motions below the photosphere drive the solar cycle which is associated with variations in the magnetic field structure and accompanying phenomena. In addition to semi-empirical models, dynamo theories have been used to explain the solar cycle. The emergence of magnetic field generated by these mechanisms and its expansion into the corona involves many plasma physical processes. Magnetic buoyancy aids the expulsion of magnetic flux. The corona may respond dynamically or by continually adjusting to a quasi-static force-free or pressure-balanced equilibrium. The formation and disruption of current sheets is significant for the overall structure of the coronal magnetic field and the physics of quiescent prominences. The corona has a fine structure consisting of magnetic loops. The structure and stability of these are important as they are one of the underlying elements which make up the corona. (88 refs.)

69589 Electrodynamics of the outer solar atmosphere. M.Kuperus (Astron. Inst., Univ. of Utrecht, Utrecht, Netherlands).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.47-54 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
The structure of the outer solar atmosphere and its magnetic coupling to the photospheric motions indicate the existence of large-scale current systems. The heating and the dynamics of coronal structures is therefore governed by electrodynamic coupling of these structures to the underlying photosphere. In a structured corona, the heating is enhanced because of several processes such as resonance absorption of Alfvenic surface waves, anomalous Joule heating, reconnection and the related topological dissipation. The global thermal and dynamic behaviour of coronal structures can be fruitfully described, in terms of equivalent electrodynamic circuits, taking into account the paramount role of the photospheric boundaries. Coronal current systems may be stable, as in the case of coronal loops, but occasionally they show catastrophic behaviour if the current intensity surpasses a critical threshold. (33 refs.)

69590 Dynamics of the preflare magnetic field. J.W.Harvey (Kitt Peak Nat. Obs., Tucson, AZ, USA).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.55-62 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Many theories of the solar flare process invoke storage of energy in the active region magnetic field above the solar photosphere. Observational evidence relating to such storage is rather unsatisfactory owing to the difficulty in observing the three-dimensional structure of the magnetic field. Indirect evidence comes from changes in structures presumed to trace the magnetic field, from changes in the line-of-sight and transverse components of the photospheric magnetic field, from mass flow patterns observed by proper motions and line-of-sight Doppler shifts, and from radio observations. These data tend to confirm that energy sufficient to produce flares can be stored in active region magnetic fields with a characteristic time scale of hours but critical observations are not yet available. (66 refs.)

69591 Solar wind theory. S.Cuperman (Dept. of Phys. & Astron., Tel Aviv Univ., Ramat Aviv, Israel).
Space Sci. Rev. (Netherlands), vol.34, no.1, p.63-72 (Jan. 1983). (Fifth International Symposium on Solar-Terrestrial Physics, Ottawa, Canada, 17-22 May 1982).
Some advances in the hydrodynamical large-scale theory, on the one hand, and in the kinetic theory, on the other hand, of the solar wind are reviewed.

For brevity, the author sketches the general frame, points out the problems and approaches and then illustrates by a few example the ways in which progress has been achieved during the past four years. (32 refs.)

69592 Intermediate drift bursts. O.Elgaroy.
Report 53, Univ. Oslo, Blindern, Norway (1982), 30 pp.
Different parameters which are characteristic of intermediate drift bursts are determined from observations undertaken with high resolution radio spectrographs operating in four frequency bands between 150 and 1000 MHz. Data on frequency drift velocity, duration, bandwidth and frequency profile are given. The occurrence of bursts in groups is examined. Correlation is shown to exist between frequency drift velocity and observed bandwidth. The relation between observed and intrinisc values of bandwidth and duration is discussed, together with magnetic field strengths, which may be derived in different ways. (18 refs.)

97.00 STARS

97.10 STELLAR CHARACTERISTICS

69593 On the origin and structure of stellar magnetic fields. J.H.Piddington (Div. of Appl. Phys., CSIRO, Sydney, Australia).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.217-30 (Feb. 1983).
Newly formed stars have magnetic fields provided by the compression of the interstellar field, and contrary to a widely accepted idea these fields are not destroyed by convective motions. For the same reason, the fallacy of 'turbulent diffusion', turbulent dynamo action is not possible in any star. Thus all stellar magnetic fields have a common origin, and persist throughout the lifetime of each star, including degenerate phases. This common origin, and a general similarity in stellar evolutionary processes, suggest that the fields may develop similar structural characteristics and MHD effects. The author considers three features of solar magnetic fields and their MHD effects. First, the solar magnetic field comprises two separate components: a poloidal field and a toroidal field. The former is a dipole field, permeating the entire Sun and closely aligned with the rotational axis; at the surface it is always concealed by much stronger elements of the toroidal field. The latter is probably wound from the former by differential rotation at latitudes below about 35°. The second feature of solar magnetic fields is that all flux is concentrated into flux tubes of strength some kG, isolated within a much larger volume of non-magnetic plasma. The third feature is that the flux tubes are helically twisted into flux ropes (up to $\gtrsim 10^{22}$ Mx) and smaller elements ranging down to flux fibres ($\lesssim 10^{18}$ Mx). Some implications of similar features in other stars are discussed. (39 refs.)

69594 Hydrogen sulfide in a circumstellar envelope. N.Ukita (Inst. de Radio Astron. Millimetrique, Domaine Univ. de Grenoble, Saint-Martin d'Heres, France), M.Morris.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.15-18 (May 1983).
A search for hydrogen sulfide in the cool circumstellar envelopes of 25 stars was made using the 1_{10}-1_{01} rotational line at 1.8 mm. It was detected in the bipolar nebula/OH maser OH 231.8+4.2, an object having a high rate of mass loss. An approximate analysis indicates that 1/60 of the sulfur in this outflowing envelope is in the form of H_2S, a fraction which may be similar to that in the atmosphere of the central star. In addition, the shape of the observed line profile is discussed in terms of a possible variation of the outflow velocity with latitude above the system's equatorial plane. (20 refs.)

69595 Numerical simulation of radiative transfer in circumstellar dust shells. II. Ellipsoidal shells. J.Lefevre (Obs. de Nice, Nice, France), J.-Y.Daniel, J.Bergeat.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.51-8 (May 1983).
For pt.I see ibid., vol.114, no.2, p.341-6 (1982). A numerical method is used to solve the radiative transfer problem. Multiple scattering, anisotropic phase functions and grain thermal emission are fully considered. This solution is an extension of the algorithm proposed by the authors for spherical shells. Dust grains are assumed spherical in shape and the Mie theory is adopted. The study is devoted to shells with uniform dust distribution. The computation gives the distribution of dust temperatures versus (r, θ) sperical coordinates, the spectral distribution of the outward net flux, the bidimensional images of the source at selected wavelengths for various values of the foreshortening angle (α) which specifies the observer's location. (9 refs.)

69596 On the influence of the 'α-turbulence' on the energy transport in accretion disks. W.J.Duschl (Inst. fur Astrophys., Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.153-4 (May 1983).
In the standard 'α-theory' for thin accretion disks [Shakura and Sunyaev (1973), Lightman (1974), and many others; for recent reviews see Pringle (1981) and Verbunt (1982)] the non-molecular viscosity is described by the ratio α of the viscous stress to the pressure. This viscous stress is usually thought to be caused by hydrodynamic or hydromagnetic turbulence. While the viscosity is taken to cause all the luminosity, the effect of such turbulence on the energy transport is not taken into account. It is shown that in radiatively structured disks the assumed turbulence contributes only less than one percent of the whole energy flux. (11 refs.)

69597 Possible evidence for the driving of the winds of hot stars by Alfven waves. A.B.Underhill (Lab. for Astron. & Solar Phys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L127-30 (15 May 1983).
Ultraviolet spectra of the supergiants α Cam (0.95 Ia), HD 105056 (ON9.7 Iae), and 15 Sgr (O0.7 Iab) are compared, and it is shown that the terminal outflow velocity, v_∞, of HD 105056 is one-half that of the other two stars even though HD 105056 has the highest effective temperature of the three stars. This anomaly, together with the fact that the observed v_∞ values for early-type stars scatter about an empirical correlation between v_∞ and log T_{eff} by an amount which is larger than the amount expected according to the observational errors in determining v_∞ and log T_{eff}, leads to the conclusion that an agent in addition to radiation, Alfven waves, is driving the winds of early-type stars. (23 refs.)

69598 Dynamical constraints on star formation efficiency. R.D.Mathieu (Dept. of Astron., Univ. of California, Berkeley, CA, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L97-101 (15 April 1983).
Dynamical constraints are placed on the local star formation efficiency during the formation of star clusters. Virial models are used to examine the expected changes in cluster velocity dispersion, density, and radius during the period when the gas not converted into stars is removed from the system. Comparison of observed initial and final states of open clusters indicate local efficiencies of about 30% if the gas dispersal is slow relative to the dynamical crossing time and 55% if the gas loss is rapid. Efficiencies are somewhat dependent on support mechanisms of molecular clouds, but it is argued that observations of young clusters are in accord with the assumptions of the models used here. (24 refs.)

69599 The influence of waves on line formation in stellar atmospheres. J.Stahlberg (Zentralinst. fur Astrophys., Akad. der Wisseuschaften, Potsdam, Germany).
Astron. Nachr. (Germany), vol.304, no.1, p.49-53 (1983).
The influence of acoustic waves on line formation is investigated. The effects of velocity model parameters, e.g. wave number and amplitude, and of the μ-dependence on line formation are discussed by simplified model assumptions. The effects of waves and Gaussian stochastic turbulence are compared. (10 refs.)

69600 Atomic and molecular hydrogen in the circumstellar envelopes of late-type stars. A.E.Glasscold, P.J.Huggins (Dept. of Phys., New York Univ., New York, NY, USA).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.517-32 (May 1983).
Discusses the distribution of atomic and molecular hydrogen in the expanding circumstellar envelopes of cool evolved stars. The main concern is to evaluate the effects of photodestruction of H_2 by galactic UV radiation, including shielding of the radiation by H_2 itself and by dust in the envelope. One of the most important parameters is the H/H_2 ratio which is frozen out in the upper atmosphere of the star. For stars with photospheric temperatures $T_* \gtrsim 2500$K, atmospheric models suggest that the outflowing hydrogen is mainly atomic, whereas cooler stars should be substantially molecular. In the latter case, photodissociation of H_2 and heavy molecules contribute to the atomic hydrogen content of the outer envelope. The estimates indicate that atomic hydrogen is almost at the limit of detection in the C-rich star IRC+10216, and may be detectable in warmer stars. (39 refs.)

69601 A model for the magnetic field above supergranules. U.Anzer, D.J.Galloway (Max-Planck-Inst. fur Astrophys., Garching, Munchen, Germany).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.637-50 (May 1983).
A model is provided for the inhomogeneous magnetic field structure above a stellar photosphere where the field is concentrated in intense tubes at the downflow regions of a convection pattern. By finding where the magnetic energy is strong or weak compared with the local thermal energy of the gas, the relative importance of magnetic and non-magnetic heating mechanisms can be estimated for those regions where the principal radiative losses occur in solar or stellar chromospheres. (31 refs.)

69602 Stellar reaction rate of ^{20}Ne(α,γ)^{24}Mg. P.Schmalbrock, H.W.Becker, L.Buchmann, J.Gorres, K.U.Kettner, W.E.Kieser, H.Krawinkel, C.Rolfs, H.P.Trautvetter (Inst. fur Kernphys., Univ. Munster, Munster, Germany), J.W.Hammer, R.E.Azuma.
Nucl. Phys. A (Netherlands), vol.A398, no.2, p.279-307 (25 April 1983).
The reaction ^{20}Ne(α,γ)^{24}Mg has been investigated at E_α(lab)=0.55-3.20 MeV. Neon gas enriched to 99.95% in ^{20}Ne was recirculated in differentially pumped gas target systems of the extended and quasipoint jet types. New resonances were found at E_α(lab)=958, 1226, 1260, 1704 and 2277 keV, which correspond to known states in ^{24}Mg. Excitation energies, γ-ray decay schemes, γ-ray angular distributions, resonance widths and strengths as well as J^π and T-assignments are reported for all the resonances. Information on low-lying states in ^{24}Mg is also obtained. The nuclear and astrophysical aspects of the results are discussed. (37 refs.)

69603 Distant anticenter A-F stars and the galactic abundance gradient. C.A.Christian (Canada-France-Hawaii Telescope Corp., Kamuela, HI, USA), H.A.Smith.
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.169-80 (March 1983).
Spectrophotometry was obtained for 16 objects suspected of being highly reddened A-F stars, located in a galactic anticenter field at $l=186°$ and $b=-2.5°$. The stars have been classified according to spectral type. Two of them appear to be luminous F-type stars having large galactocentric distances (12-30 kpc). These two stars are moderately metal poor, consistent with an abundance gradient in the galactic disks of $d[\mathrm{Fe/H}]dR=-0.08\pm0.04$ kpc^{-1}. Supplementary photographic image-tube spectrograms were used as comparisons in the determination of stellar calcium abundances. (29 refs.)

97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

69604 The Mg II h and k lines in Vega. R.Freire Ferrero (Obs. Astron., Strasbourg, France), P.Gouttebroze, Y.Kondo.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.59-68 (May 1983).
High resolution h (2802.7 Å) and k (2795.5 Å) lines Mg II obtained for the star Vega (α Lyr, A0V) with Copernicus satellite and a balloon-borne ultraviolet stellar spectrometer (BUSS) are interpreted by means of theoretical NLTE line profiles in the frame work of complete (CR) and partial (PR) redistribution hypothesis. LTE and NLTE atmospheric models with a temperature plateau or with temperature rises are used to account for the possible presence of a chromosphere on Vega. The authors discuss also the possible presence of an interstellar Mg II absorption line superimposed on the stellar ones. (52 refs.)

69605 The upper mass limit for white dwarf progenitors and the initial-final mass relation for low and intermediate mass stars. V.Weidemann, D.Koester (Inst. fur Theoretische Phys. und Sternwarte, Univ. Kiel, Kiel, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.77-84 (May 1983).
New results on white dwarfs in open clusters which establish an upper mass limit of white dwarf progenitors around $8M_\odot$ have been evaluated for the construction of a semi-empirical initial-final mass relation for stellar evolution in the low and intermediate mass range. The new M_f/M_i-relation explains the fact that the vast majority of white dwarfs and nuclei of planetary nebulae have masses in a narrow range around $0.6M_\odot$. High mass remnants exist in both cases but are extremely rare. This is confirmed by model calculations of galactic evolution which are carried out with improved input data on IMF, stellar birthrates, and stellar dynamics, for different M_f/M_irelations. Constraints are thus provided for theoretical schemes of single star evolution with mass loss, dredge-up, and enrichment of the interstellar medium. (92 refs.)

69606 Non-LTE analysis of subluminous O-stars. V. The binary system HD 128220. J.Gruschinske, W.-R.Hamann, R.-P.Kudritzki, K.P.Simon, J.P.Kaufmann.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.85-90 (May 1983).
For pt.IV see ibid., vol.95, no.2, p.244-9 (1981). Spectra of the binary system HD 128220 were taken in the UV and in the visual. The hot component−an O subdwarf−is analysed by means of non-LTE calculations. The analysis is hampered because the visual spectrum is contaminated by the cool companion. Using the helium lines only, the atmospheric parameters can be restricted to the range between two models. The cool companion has an effective temperature about 5500±500K (Type G). The discussion of the stellar parameters arrives at results which agree with those derived from the mass function (Wallerstein and Wolff, 1966). If both components have about the same mass, these masses lie above 3 $M_\odot$. An O subdwarf of such a high mass has not yet been found and may be a supernova candidate. However, within the error margin of the orbital data also a mass ratio of $M_O/M_G=0.5$ cannot be excluded, which would lead to stellar parameters which are more common for sdO's. (22 refs.)

69607 Discovery of a nitrogen-rich UV-bright star in the globular cluster M5. R.C.Bohlin (Lab. for Astron. & Solar Phys., Goddard Space Flight Center, Greenbelt, MD, USA), R.H.Cornett, J.K.Hill, A.M.Smith, T.P.Stecher, A.V.Sweigart.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L89-92 (15 April 1983).
Ultraviolet images of the globular cluster M5 (NGC 5904) obtained with a rocket-borne telescope show a hot and luminous star ~20″ from the cluster center. Spectra of this UV-bright star, obtained with the International Ultraviolet Explorer satellite in the low-resolution mode, reveal an energy distribution very similar to that of μ Col, a Population I O9.5 IV star with $T_{eff}=35000K$ and log $g=4.19$, except for the absence of metallic line blanketing. Assuming an effective temperature of 35000K for the UV-bright star, the authors find $L=1800$ $L_\odot$, $M_{bol}=-3.40$, $R=1.15$ $R_\odot$, and log $g=4.04$. The N V $\lambda 1240$ line is much stronger in the UV-bright star than in μ Col, indicating that the CNO cycle has converted the envelope C and O into N. A single emission line at the wavelength of the N IV intercombination line is also present, suggesting the possible existence of a planetary nebula. The mass-luminosity relation for asymptotic giant branch stars gives $M=0.53$ $M_\odot$, implying a mass loss of 0.08 $M_\odot$ since the horizontal-branch phase. (30 refs.)

69608 Measurement of the absolute monochromatic flux from Vega at $\lambda 2.20$ and $\lambda 3.80$ μm by comparison with a furnace. M.J.Selby, C.M.Mountain (Blackett Lab., Imperial Coll. of Sci. & Technol., London, England), D.E.Blackwell, A.D.Petford, S.K.Leggett.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.795-800 (May 1983).
A determination has been made using the 1.5-m flux collector at Tenerife of the absolute monochromatic flux from Vega at 2.20 and 3.80 μm by comparison with the flux from a furnace which has been calibrated against a standard blackbody at a known temperature. The technique used is an improvement on one previously used by the authors at Tenerife in 1979. The fluxes found are 3.92×10^{-10} W m^{-2} μm^{-1} at 2.20 μm, and 5.28×10^{-11} W m^{-2} μm^{-1} at 3.80 μm, each with an accuracy of about 4 per cent. Comparison is made with other calibrations and with calculated fluxes. The agreement with other calibrations is good, but comparison with the flux calculations of Dreiling and Bell (1980) for their model shows an observed excess flux of 8 per

cent at 3.80 μm. Suggestions are made to account for this excess. An empirical flux distribution over the wavelength range 1 $\mu m<\lambda<4$ μm is proposed with a likely accuracy of 3 per cent. (16 refs.)

69609 Stellar rotation as a controller of coronae and chromospheres of giant stars. D.F.Gray (Univ. of Western Ontario, London, Ontario, Canada).
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.181-4 (March 1983).
The flux of X-ray emission from F, G, and K giants drops abruptly at G5 III. This mimics the drop in rotation rates of giants seen previously. The X-ray flux, when normalized to the bolometric flux, varies as the square of the equatorial surface rotation velocity. Lines formed in the chromospheric and transition region do not show such a close relationship with rotation, but are still correlated with it. Other H-R-diagram boundaries, such as the one for the V/R ratio for the Ca II K-line emission, appear not to be directly coupled to the stellar rotation. (35 refs.)

97.30 VARIABLE AND PECULIAR STARS

(inc. novae)

69610 A reanalysis of the data of three classical Cepheids: V381 Cen, V500 Sco, and SV Vel. G.Russo (Capodimonte Astron. Obs., Naples, Italy).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.147-51 (Feb. 1983).
Using the recently developed CORS method, applied to the photometric data of Walraven et al. (1964), the author has determined improved radii for the three classical Cepheids V381 Cen, V500 Sco, and SV Vel. These new determinations are in good agreement with theoretical computations for the center of the instability strip (Cogan, 1978). Some peculiar parameters are also computed, from the analysis of photometric data. (13 refs.)

69611 The influence of magnetic fields on nova outbursts. M.Livio (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.L7-10 (May 1983).
Magnetic fields were found to play an important role in many cataclysmic variables. The effects of a magnetic field on nova outbursts are examined. It is found that magnetic field strengths above a certain limit can inhibit nova explosions. This can explain why active novae are absent among AM Her objects, while novae can be found among intermediate polars. (29 refs.)

69612 A model for the standstill of the Z Camelopardalis variables. F.Meyer, E.Meyer-Hofmeister (Inst. fur Astrophys., Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.29-34 (May 1983).
Recent models relate the outbursts of dwarf novae to convective outer regions of accretion disks around the primary white dwarf. Such regions disappear for accretion rates above a critical value $\dot{M}_{crit}$. By means of disk structure computations the authors show that the accretion rate in Z Cam is near $\dot{M}_{crit}$. The authors suggest that in standstills it is slightly higher than this value while in the cyclic phase it is slightly lower. This is explained as an effect of irradiation of the secondary's surface producing higher mass overflow rates in steady standstills than in cyclic phases and enabling the system to remain in either state. In the long run an imbalance between the mean accretion rate $\dot{M}_0$ and the actual accretion rate in either state forces the system to alternate between its two states in form of a relaxation oscillation. With this model the Z Cam system fall between the U Gem subgroup and the UX Uma subgroup. Observational evidence for the model is discussed. (26 refs.)

69613 Properties of Am, δ Del, and δ Sct stars in the VBLUW system. M.J.J.Wiertz, A.M.van Genderen (Leiden Obs., Leiden, Netherlands).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.35-41 (May 1983).
VBLUW photometric observations of 115 Am, δ Del, and δ Sct stars are presented and discussed. The spread with respect to the main sequence in the two-colour diagrams is discussed. The temperatures derived by Babu and Shylaja (1981, 1982) and based on spectral energy distribution, reveal that the photometric temperatures are underestimated. This is caused by line blanketing on the colour indices $b-y$ and $V-B$, of which the size as a function of the temperature can be roughly estimated. The relation between the temperature sensitive colour indices $V-B$ (of the VBLUW system), $b-y$ ($ubvy\beta$ system) and B_2-V_1 (Geneva system) for A/F type stars is investigated. A PLC relation for the colour $V-B$ is derived using Breger's (1979) relation for the colour $b-y$. (30 refs.)

69614 An observational study of the influence of close companions on the pulsations of β Cephei stars. C.Waelkens (Obs. de Geneve, Sauverny, Switzerland), F.Rufener.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.45-50 (May 1983).
The evidence for short-period pulsations of seventeen close binary stars that fall in the zone of the HR diagram defined by the β Cephei stars is discussed. The only star in the sample for which the authors detected pulsations is η Orionis; its orbital period is about twice that of α Virginis. It is suggested that the tidal interactions have a damping effect on β Cephei type pulsations. This would explain why the observed lower limit of the orbital periods of the binary β Cephei stars is about three times the theoretical lower limit, which corresponds to a contact configuration. It is also suggested that tidal effects are responsible for the variations of the pulsation amplitudes of the three β Cephei stars with shortest known orbital periods: α Virginis, β Cephei and 16 Lacertae. (48 refs.)

69615 On the variability of RZ Cephei. Z.Glownia (Inst. of Phys., Silesian Univ., Katowice, Poland).
Astron. Nachr. (Germany), vol.304, no.1, p.45-8 (1983).
A long series of photoelectric observations of RZ Cep is analysed by two independent methods. The derived period is in good agreement with the suspected lengthening of the period. The secondary variability seems to be spurious. (9 refs.)

69616 Commission 27 of the IAU information bulletin on variable stars. J.Horn, R.Hudec, P.Koubsky (Astron. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Inf. Bull. Variable Stars (Hungary), no.2304, p.1-2 (30 March 1983).
The authors report photometric data for the Be star V1294 Aquilae (=HD 184279 =MWC 319) derived from blue-sensitive photographic plates taken in the period 1929 to 1980. The estimated photographic magnitudes were analysed for possible periods; a reasonable fit was obtained for periods of about 2800 to 3000 days, but no strict long-term periodicity was found. The correlation between photometric and spectral variations is discussed: the current shell episode (which has lasted for more than 4000 days) and a previous prolonged shell episode from JD 2425000 to 2430000 were accompanied by profound and complex light variations, whereas a short-lived shell episode around JD 2432000 passed without any unusual light variations. (1 ref.)

69617 On the short time scale period of α Cir. H.Schneider (Univ. of Gottingen, Gottingen, Germany), W.W.Weiss.
Inf. Bull. Variable Stars (Hungary), no.2306, p.1-2 (5 April 1983).
The authors report VBLUW photometry of the rapidly oscillating Ap star α Circini (HD 128898) on the night of 1982 July 23 to 24. Light variations with a period of 6.834±0.01 minutes and an amplitude of about 0.01 mag. were observed. The amplitude of pulsation seems to be variable; this variability may allow an independent determination of the rotation period and may set limits on i and β. (4 refs.)

69618 New research on periods of Ap stars observed at ESO. VII. J.Manfroid, P.Renson (Inst. d'Astrophys., Univ. de Liege, Liege, Belgium).
Inf. Bull. Variable Stars (Hungary), no.2311, p.1-2 (12 April 1983).
For pt.VI see I.B.V.S., No. 2004 (1981). The authors report periods and amplitudes of variations for seven Ap stars from uvby photometry during September 1981 and January 1982. The stars observed, with their periods, are HD 208217 (8.35^d), HD 10840 (2.100^d), HD 45530 (1.585^d), HD 58292 (2.95^d or 1.484^d), HD 58448 (0.831^d), HD 64972 (0.727^d?) and HD 66698 (4.12^d). Observations of small amplitude variations in α Sculptoris (HD 5737) and HD 189832, with periods of about 15 days and 16 days respectively are also reported. Four other Ap stars (74 Aquarii, 29 Piscium, HR 151 and HR 444) showed no detectable variations; HR 11 showed small amplitude variations, but the period could not be determined. Finally it is reported that five comparison stars (HR 8369, 70 Aquarii, HD 224639, HD 45431 and HR 2944) have been found to be variable. (no refs.)

69619 Radial velocity variation of the Be star 6 Cep (HD 203467). Z.T.Krajeeva (Dept. of Astron., Bulgarian Acad. of Sci., Sofia, Bulgaria), P.Koubsky.
Inf. Bull. Variable Stars (Hungary), no.2313, p.1-3 (18 April 1983).
The authors report an analysis of the radial velocity variations of the Be star 6 Cephei, using 80 measured radial velocities. Owing to the inhomogeneity of the data, two files of data were formed: the first (file A) contains all 80 measurements, whereas the second (file B) contains only the 51 most reliable measurements. The data of file A yield a radial velocity variation with $P=2.438942^d$, K=7.0 kmbs, whereas those of file B yield $P=0.708469^d$, K=9.0 kmbs. The results are consistent with the hypothesis that 6 Cephei is a binary star with an unseen companion of mass 0.5 $M_\odot$ (file A) or 0.4 $M_\odot$ (file B); however, it is pointed out that the 0.7^d period is close to the rotational period of the star. (9 refs.)

69620 Differential UBV-photometry of the chemically peculiar star HD 135297. H.M.Maitzen (Inst. fur Astron., Univ. Klien, Klien, Austria).
Inf. Bull. Variable Stars (Hungary), no.2324, p.1-2 (29 April 1983).
The author reports UBV photometry of the magnetic Ap star HD 135297 on twelve nights covering the period 1970 May 6 to June 16. The standard deviations of the measurements in the three colours are σ(U)=0.0105, σ(B)=0.0063 and σ(V)=0.0048. There is a weak indication that the U-values show a periodicity of about 3 days. In addition the author analyses the results of Stromgren photometry of HD 135297 during the period 1974 March 25 to April 2; the results are in good agreement with UBV photometry, and it is concluded that there is only marginal evidence for light variations in this star. (2 refs.)

69621 BD+37°443: a new red variable star. M.Lolli, L.Oculi, A.Piccioni, R.Serra (Dipartimento di Astron., Univ. di Bologna, Bologna, Italy).
Inf. Bull. Variable Stars (Hungary), no.2325, p.1 (2 May 1983).
It is reported that BD+37°443 (KO III), which was used by Bartolini et al. (1982) as a comparison star for the O-type subdwarf BD+37°442, is variable. According to the BD catalogue and the AGK2 catalogue, BD+37°443 is brighter than BD+37°442, but in 1977 BD+37°443 was much the fainter star. BV photometry of the two stars between November 6 and December 17, 1977, and on 1983 January 6 is reported: during 1977, BD+37°443 was fainter than BD+37°442 by about $\Delta V=0.6$ mag., but in January 1983 BD+37°443 was the brighter star by $\Delta V=0.29$ mag. The amplitude of the light variation of BD+37°443 is at least 0.9 mag. in V and 0.7 mag. in V. BD+37°443 may therefore be a long period variable star or a semiregular variable. (5 refs.)

69622 Spurious periods and the case of EL Comae Berenices. J.Wheatley (Maria Mitchell Obs., Nantucket, MA, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.17-20 (1982).
An average period of 0.52285 day was calculated from 1978-81 observations of EL Comae Berenices. A 0.343 day period preferred by previous observers is rejected as spurious. EL Comae Berenices exhibits irregular light variations which prevent easy distinction between the two periods. (5 refs.)

69623 Does S1910 vary?. D.Hoffleit (Yale Univ. Obs., New Haven, CT, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.25-6 (1982).
A star suspected of variability by A.J. Cannon in 1899, S1910, at $\alpha=12^h 36.2^m$, $\delta=-59°\ 08'$ (1900), and still unconfirmed, has been examined on about 1000 Harvard patrol plates. it appears to vary from magnitude 4.9 to about magnitude 5.7. (no refs.)

69624 The decreasing periods of R Aquilae and R Hydrae. M.S.Davis (Dept. of Astron., Villanova Univ., Villanova, PA, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.27-34 (1982).
Times of maximum light of the long period variables R Aquilae and R Hydrae have been fitted to parabolic elements corresponding to constantly decreasing periods. The fit is satisfactory for R Aquilae but not for R Hydrae. (10 refs.)

69625 Photometry of Betelgeuse from October 1981 to March 1982. K.L.Krisciunas (UK Infrared Telescope, Hilo, HI, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.37-40 (1982).
Observations of Betelgeuse in V and B−V from October 1981 to March 1982 are presented, showing variations of brightness and color. Three seasons of observations are summarized. The possible origin of the variations is briefly discussed. (4 refs.)

69626 SU Tauri. C.E.Spratt, J.Bortle.
I.A.U. Circ. (USA), no.3791, 1 pp. (14 April 1983).
Visual magnitude estimates are reported for the R Coronae Borealis star SU Tauri, covering the period 1983 March 5 to April 6. During this time the star faded from mag. 12.2 to mag. 13.1. (no refs.)

69627 11 Camelopardalis. L.Pastori.
I.A.U. Circ. (USA), no.3795, 1 pp. (29 April 1983).
It is reported that spectroscopic observations of the extreme Be star 11 Camelopardalis on 1982 December 13 and 29 show the appearance of emission features in the Balmer lines up to H12. Moreover the Fe II emission lines at 454.95 and 458.38 nm show an increase in intensity and have become clearly discernible. This behaviour is similar to that observed during the outbursts of 1916-19, 1929-31 and 1943-49; thus it seems that the star has commenced a new active phase. (no refs.)

69628 Transient X-ray rings around dwarf novae. G.Norwell, A.Evans, M.F.Bode (Dept. of Phys., Univ. of Keele, Keele, England).
Nature (GB), vol.303, no.5912, p.49-50 (5 May 1983).
The possibility that point X-ray sources possess extended haloes arising from scattering of X-rays by interstellar grains has been discussed by several authors and recent observations using the Einstein X-ray satellite have suggested that observational evidence for such haloes is now becoming available. Much of the theoretical work on such haloes to date has involved steady (time-independent) X-ray sources. While haloes around such sources can provide useful information about the scattering medium, variable X-ray sources are potentially much more powerful probes of the interstellar dust distribution. The authors discuss the scattering of soft X-rays emitted by dwarf novae in outburst, during which these objects undergo short (~1 day) eruption at soft X-ray wavelengths. The authors also consider the nature of the apparently transient soft X-ray 'ring' around the dwarf nova SU UMa and show that the properties of such a ring are consistent with those expected from the effect under consideration. (12 refs.)

69629 Detailed photometry of the Cepheid AD Geminorum. L.P.Connolly (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada), L.H.Palmer, B.D.Goodrich, W.Halbedel, J.L.Africano, G.W.Henry.
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.192-5 (March 1983).
A detailed light curve for AD Vem in G and $(b-y)$ is presented. The results of these observations are used in planning the requirements of a major observing program. (2 refs.)

69630 Identification of Lanning 90 as a previously uncataloged cataclysmic variable. A.W.Shafter (Dept. of Astron., Univ. of California, Los Angeles, CA, USA), H.H.Lanning, R.K.Ulrich.
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.206-10 (March 1983).
Presents spectroscopic observations which reveal Lanning 90 to be a previously uncataloged cataclysmic variable. Low-resolution spectra of the object display strong and broad emission lines of hydrogen and neutral helium superimposed on a continuum with roughly constant F_λ. In addition to the Balmer and He I emission lines, the spectrum shows high excitation lines of He II, C II, C III, and N III. After a brief discussion of its general spectral character the authors argue that Lanning 90 is probably a nova-like variable, the authors note that the photometric and spectroscopic variability exhibited by the object is similar to the variability shown by the AM Herculis systems. (21 refs.)

69631 ANS ultraviolet observations of dwarf Cepheids. C.R.Sturch, C.C.Wu (Computer Sci. Corp., Silver Spring, MD, USA).
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.211-16 (March 1983).
Ultraviolet observations of three dwarf Cepheids (VZ Cnc, SX Phe, and AI Vel) are presented. The UV light curves are consistent with those in the visual region. When compared to standard stars, all three dwarf Cepheids exhibit flux deficiencies at the shortest observed wavelengths. The most extreme deficiencies appear for SX Phe; these may be related to the other properties previously noted for this star, including low metallicity, high space motion, and low luminosity. 97.60 LATE STAGES OF STELLAR EVOLUTION

(inc. black holes)

69632 Stellar collapses in the Galaxy. J.N.Bahcall (Inst. for Advanced Study, Princeton, NJ, USA), T.Piran.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L77-81 (15 April 1983).
The expected rate of stellar deaths in the Galaxy (~0.1 per year) is computed using a detailed model of the distribution of stars in the disk and standard values for Population I stellar evolutionary lifetimes. Some of the uncertainties in this calculation are described. The sensitivities to stellar collapse of the existing gravitational wave and solar neutrino detectors are expressed in terms of convenient astrophysical variables and are found to be comparable for conventional choices of collapse parameters. The fraction of stars in the Galaxy that are accessible to a detector—of any kind of radiation (including X-ray or γ-ray satellites or ground-based telescopes)—that can survey out to a given distance is tabulated for different maximum distances and is shown to be important for interpreting the capabilities of existing detectors. The results of Davis provide the best available upper limit on the collapse rate. At least one order of magnitude improvement in the sensitivity of solar neutrino or gravitational wave detectors is necessary in order to detect galactic stellar collapses at the rate predicted by current models. (36 refs.)

97.60B Supernovae

69633 Lepton loss and entropy generation in stellar collapse. B.Datta (Indian Inst. of Astrophys., Bangalore, India), P.P.Deo.
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.109-15 (Feb. 1983).
The effects of uncertainties in determining the loss of neutrinos and the generation of entropy during the collapse of a stellar core are studied using a simple spherically-symmetric homologous collapse model with an improved treatment for the excited nuclei. It is found that the neutrino loss and entropy generation are not altogether insensitive to most variations of the assumptions regarding the input physics, collapse rate and initial conditions and in particular the need to determine accurately beta capture rates in stellar collapse is pointed out. (12 refs.)

69634 Supernova in ESO 270-G05. J.Maza.
I.A.U. Circ. (USA), no.3791, 1 pp. (14 April 1983).
The author reports the discovery on 1983 April 6 of a possible 18th-magnitude supernova 18″ west and 10″ south of the nucleus of the galaxy ESO 270-G05 ($\alpha=13^h 18.7^m$, $\delta=-45°40'$, equinox 1950.0), in Centaurus. (no refs.)

69635 Supernova in NGC 4753. W.Wamsteker, A.Talavera, F.Machetto, N.Panagia, G.G.C.Palumbo, A.Piccioni, G.Vettolani.
I.A.U. Circ. (USA), no.3791, 1 pp. (14 April 1983).
The authors report optical and ultraviolet observations of the supernova in NGC 4753 during April 1983. An ultraviolet spectrogram between 200 and 300 nm obtained by the IUE satellite shows a weak spectrum steeply decreasing towards shorter wavelengths, characteristic of a type I supernova. An optical spectrogram obtained on 1983 April 10 also shows the supernova to be a type I object, with prominent absorption at 615 nm. The fine-error-sensor magnitude measured by the IUE was 12.7, but this includes a contribution from NGC 4753 itself. The position of the supernova is $\alpha=12^h 49^m 47.4^s$, $\delta=-00°55'54''$ (equinox 1950.0). (no refs.)

69636 Supernova in NGC 4753. H.G.Corwin, E.P.Aksonov, T.Fetterman, C.Spratt.
I.A.U. Circ. (USA), no.3794, 1 pp. (29 April 1983).
Reports UBVRI photometry of the supernova in NGC 4753 on 14 and 16 April 1983. The colours and the rate of decline are consistent with those of type I supernovae 12 to 15 days past maximum. An independent discovery of the supernova on 1983 April 9 at $m_{pg}=13.4$ is reported, and visual magnitude estimates are given for the period 1983 April 11 to 17. (no refs.)

69637 PSR 1937+214. R.N.Manchester, B.A.Peterson, P.T.Wallace.
I.A.U. Circ. (USA), no.3795, 1 pp. (29 April 1983).
The authors report the detection of optical pulses at the 0.0016-s period of PSR 1937+214 (the millisecond pulsar') on 1983 April 20 and 21. The pulse profile has two components separated by about 40% of the period. The pulses were detected at the same phase on two consecutive nights using a 3.5″ aperture centred on a red star at $\alpha=19^h 37^m 28.70^s$, $\delta=+21°28'03.3''$ (equinox 1950.0, FK4 system); this is the candidate star suggested by Djorgovski (1982). The observed pulse variation is about 20% of the total light of the star. The star appears to be 2″ notch of the VLA radio position of the pulsar. The star is considerably brighter on a CCD image than on the Palomar Sky Survey red plate; the stellar spectrum does not exhibit strong emission lines. (2 refs.)

97.60G Pulsars

69638 Theory of NP 0532 pulsar radiation and the nature of the activity of the Crab Nebula. J.G.Lominadze, G.Z.Machabeli (Abastumani Astrophys. Obs., Acad. of Sci., Tbilisi, Georgian SSR), V.V.Usov.
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.19-43 (Feb. 1983).
Plasma processes in the magnetospheres of pulsars are considered. A self-consistent radiation model of the pulsar NP 0532 and the Crab Nebula is

presented. It is based on the consideration of cyclotron instability in a relativistic electron-positron plasma in a strong magnetic field. This instability onsets near the light cylinder of pulsar NP 0532. The pitch-angle and energy distribution of particles, caused by cyclotron instability development, is found. It is shown that the X- and γ-ray radiation of the pulsar is explained by the synchrotron radiation of beam particles. The scattering of excited oscillations on plasma particles is responsible for nonzero pitch-angles of the latter. As a result, synchrotron radiation originates which is within optical frequencies. The synchrotron luminosity evaluated coincides with that observed for NP 0532 in that spectral region. Cyclotron waves are pumped to lower frequencies due to nonlinear scattering by plasma particles and leave the pulsar magnetosphere as observable radio waves. The spectrum of ultra-relativistic electron-positron pairs ejected from the magnetosphere of the pulsar NP 0532 into the Crab Nebula is calculated. The expected spectrum of the synchrotron radiation of these particles in the Nebula agrees well with its observed spectrum at optical and X-ray frequencies. (53 refs.)

69639 Another millisecond pulsar. V.Boriakoff, R.Buccheri, F.Fauci.
I.A.U. Circ. (USA), no.3806, 1 pp. (11 May 1983).
The authors report the discovery of a millisecond binary radio pulsar at $\alpha=19^h\ 53^m\ 26.7^s$, $\delta=+29°00'42''$ (equinox 1950.0; VLA), inside the error box of the gamma-ray source 2C G065+1. The period and the period derivative on 1983 April 3.46 UT are $P=6.13369\pm0.000019$ ms and $\dot{P}<0.58\times10^{-15}$. The dispersion measure is 104.5 ± 0.3. The orbital elements of the binary system are $P=120\pm4$ days; $a \sin i=(0.92\pm0.08)\times10^7$ km; $e\sim0$. (no refs.)

69640 Fast pulsars with disks. F.C.Michel (Dept. of Space Phys. & Astron., Rice Univ., Houston, TX, USA), A.J.Dessler.
Nature (GB), vol.303, no.5912, p.48 (5 May 1983).
It is quite likely that fast pulsars are not rare; there are several point-like radio sources with pulsar-like radio spectra that might prove to pulse in the millisecond range. The possibility that the pulsar PSR 1937+214 is a new class of object has been considered by adherents of the vacuum model. The authors point out that the measured parameters of PSR 1937+214 are consistent with the proposed disk model of radio pulsars. Using the measured values of P and $\dot{P}$ and the scalings provided in this theory, the authors expect a surface magnetic field strength of $\sim10^8$ G, a radio-emission output of 10^{31} erg s^{-1}, and a weak (below detection with present instruments) output of energy in the X-ray and γ-ray ranges. The surface magnetic field cannot be checked, but the observed radio luminosity is 3×10^{30} erg s^{-1}, in agreement with the theoretical expectation of the disk model. (9 refs.)

97.60J Neutron stars

69641 Extreme relativistic model for neutron stars and pulsars. M.C.Durgapal, A.K.Pande, P.S.Rawat (Dept. of Phys., Kumaon Univ., Nainital, India).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.117-26 (Feb. 1983).
Exact solutions have been obtained for a massive fluid sphere under the extreme causality condition $(dP/d\rho)=1$. Radial pulsational stability of these structures has been discussed. It is found that for pulsationally stable configurations the surface to central density ratios is greater than 0.30, the maximum values for surface and central redshifts are 0.85 and 3.40 respectively in the extreme case, and the maximum mass and size are respectively 4.8 $M_\odot$ and 20.1 km. It has also been shown that these structures are gravitationally bound, with a maximum binding energy per unit rest mass equal to 0.25 for a surface to central density ratio $\simeq0.40$. Slow rotation of these configurations has also been considered, and the relative drag and moment of inertia have been calculated. These results have been applied to the Crab pulsar and the mass of the pulsar has also been calculated based upon this model. (28 refs.)

69642 Torsional oscillations of neutron stars. B.L.Schumaker (California Inst. of Technol., Pasadena, CA, USA), K.S.Thorne.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.457-89 (May 1983).
Motivated by the possibility that torsional oscillations of neutron stars may be observable in the timing of pulsar subpulses and/or in future gravitational-wave detectors, the authors develop the detailed mathematical theory of such torsional oscillations and of the gravitational waves they emit. The oscillations are then analysed using the formulation of first-order perturbations of a fully general relativistic spherical stellar model. The perturbations are resolved into spherical harmonics, which decouple from each other. For each harmonic the authors present equations of motion, an action principle, an energy conservation law and a Liapunov-type proof that the oscillations are always stable. Each harmonic is then resolved into normal modes with outgoing gravitational waves and an eigenvalue problem is posed for the eigenfunctions and the eigenfrequencies ω. Five methods of solving the eigenvalue problem are presented. (40 refs.)

97.60L Black holes

69643 Tidal compression of a star by a large black hole. I. Mechanical evolution and nuclear energy release by proton capture. B.Carter, J.-P.Luminet (Groupe d'Astrophys. Relativiste, Obs. de Paris, Meudon, France).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.97-113 (May 1983).
The gross qualitative behaviour of a star plunging deeply within the Roche tidal radius, R_R, of a large black hole to a pericentre radius $\beta^{-1}R_R$, with $\beta\gtrsim3$, is examined using a simplified affine star model whose evolution is canonically determined by a Lagrangian formalism. In Phase I, for $R\gtrsim R_R$, the star remains in only slightly distorted self-gravitating quasi-equilibrium, but in Phase II its particles undergo approximately free fall in the strong external tidal field within the Roche radius. In Phase III the compression is halted and reversed by the build-up of pressure in a highly flattened pancake configuration, in which adiabatic heating raises the temperature to a maximum. In Phase IV the matter expands again in approximately free fall, and in Phase V, as the star moves outside the Roche radius, pressure and self-gravitational forces again come into play. (23 refs.)

69644 The Hawking radiation of charged Dirac particles in Kerr-Newman spacetime. Xu Dian-Yan (Dept. of Computer Sci. & Technol., Peking Univ., Peking, China).
Acta Phys. Sin. (China), vol.32, no.2, p.225-38 (Feb. 1983). In Chinese. English translation in: *Chin. J. Phys. (USA)*
The Hawking radiation of charged Dirac particles on event horizon of Kerr-Newman black holes is studied. First the author constructs the symmetrized null tetrad from which the symmetrized spin coefficients and Dirac equation are derived. Next, he solves the Dirac equation near the event horizon and get the four component ingoing and outgoing wave functions. Finally, by analytic continuation, the Hawking thermal spectrum formula for Dirac particles for arbitrary Kerr-Newman black holes is obtained. (10 refs.)

69645 Stationary axially symmetric perturbations of the Reissner-Nordstrom black hole. L.Dvorak (Dept. of Didactics of Phys., Charles Univ., Praha, Czechoslovakia).
Czech. J. Phys. Sect. B (Czechoslovakia), vol.B33, no.4, p.377-88 (1983).
Interacting electromagnetic and gravitational perturbations of a charged nonrotating black hole are investigated in the stationary axisymmetric case. Linearized Einstein-Maxwell equations with sources decompose into four independent systems. Two of them can simply be solved analytically. From one of the remaining systems the pair of decoupled equations for the odd-parity gauge-invariant quantities of Moncrief (1974, 1975) is derived. (10 refs.)

69646 Potential black-hole candidates. N.E.White, F.E.Marshall.
I.A.U. Circ. (USA), no.3806, 1 pp. (11 May 1983).
It is reported that the HEAO-1 A2 all-sky X-ray spectral survey has revealed that six X-ray sources have ultrasoft X-ray spectra ($kT<3$ keV) similar to those of several black-hole candidates in the high state. These sources are LMC X-3, LMC X-1, 4U 0142+61, H1743−32, 4U 1755−33 and 4U 1957+11. There are no X-ray eclipses associated with the 4-day binary period proposed for LMC X-1. H1743−32 was a transient source, and five other transients (A0620−00, H1705−250, 4U 1543−47, A1524−62 and 4U 1630−47) also had similarly ultrasoft X-ray spectra. The sources H0845−33, A1742−294 and 4U 1907+09 have spectra similar to either the black-hole candidates in the low state or X-ray pulsars. (3 refs.)

69647 Do black holes exist?. R.A.Waldron (School of Math., Ulster Polytech., Newtonabbey, N Ireland).
Speculations Sci. & Technol. (Switzerland), vol.6, no.1, p.97-9 (April 1983).
As black holes are formed by gravitational collapse, a vast amount of heat is generated, and the star temperature may reach 10^{12}K. This will oppose collapse, until it has been shed, and in losing energy the star must also lose mass. Since the Schwarzschild radius r_s is proportional to mass, this also decreases; as the radius of the star decreases so does r_s, and the former never catches up with the latter. So how does a black hole ever form?. (6 refs.)

97.80 BINARY AND MULTIPLE STARS

(inc. extrasolar planetary systems)

69648 A mathematical solution of general relativistic binary systems. Kau-Un Lu (Dept. of Math., California State Univ., Long Beach, CA, USA).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.127-38 (Feb. 1983).
A mathematical solution for general relativistic binary systems is obtained. A conclusion concerning black holes in some binary systems is deduced from the mathematical solution. (11 refs.)

69649 Five years of photometry of λ Andromedae. R.W.Boyd (Boyd Obs., Miami, FL, USA), J.A.Eaton, D.S.Hall, G.W.Henry, R.M.Genet, L.P.Lovell, J.L.Hopkins, J.D.Sabia, K.Krisciunas, C.R.Chambliss, P.K.Detterline, H.J.Landis, H.Louth, T.R.Renner, D.R.Skillman, R.E.Montle.
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.197-206 (Feb. 1983).
The authors present photoelectric photometry of this bright long-period RS CVn binary and use it, along with earlier photometry, to derive the photometric period and discuss the changing light curve shape. The best ephemeris for times of minimum light is $2443829.2+53.95^d E$. Because times of minimum and maximum extending back to those of Calder in 1933-37 can be phased together properly, the principal dark region must have maintained its identity for almost 50 yr. Over the last five years the brightness range has been $3.70^m<V<4.05^m$. During 1980-81 shallow secondary minima developed at phases where maxima occurred in previous years. λ And remains the only well-established case of non synchronous rotation among the known RS CVn binaries. (28 refs.)

69650 Helium cyclotron emission from accreting magnetized neutron stars. K.M.V.Apparao, S.M.Chitre (Tata Inst. of Fundamental Res., Bombay, India).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.L1-3 (May 1983).
Finds that helium nuclei accreting onto magnetized neutron stars in strong X-ray sources can emit cyclotron radiation. In the case of the X-ray source 4U 0115+63, the He cyclotron line at 6 eV in the ultraviolet should be observable with the IUE satellite. (14 refs.)

69651 Statistics of binary stars: eclipse depths. G.Giuricin, F.Mardirossian, M.Mezzetti (Osservatorio Astron. di Trieste, Trieste, Italy).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.42-4 (May 1983).
Examines the available data on the depths of the primary eclipses of extensive samples of eclipsing binaries. The comparison with several corresponding theoretical distributions proposed in the literature (Halbwachs, 1981), corrected for observational limitation effects, suggests that decreasing distributions of the mass ratio are unrealistic (they would predict too great a number of low-amplitude binaries). (22 refs.)

69652 X-ray observations of bright galactic bulge sources in the vicinity of GX 5−1. M.van der Klis (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands), S.Rappaport.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.119-23 (May 1983).
Results are presented for 44d of pointed COS-B X-ray observations of the galactic centre region around GX 5−1. It is found that GX 5−1 exhibits relatively rapid ($\sim10^3$ s) intensity transitions as well as flaring events with a typical time scale of $\sim10^4$ s. Neither GX 5−1, GX 3+1 nor GX 9+1 shows evidence of periodic intensity modulations due to orbital motion on

time scales from minutes to fractions of a day. These results are discussed in the context of proposed models for bright galactic bulge sources. (22 refs.)

69653 An X-ray survey of nine Algol systems. N.E.White, F.E.Marshall (Lab. for High Energy Astrophys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L117-20 (15 May 1983).
The observed X-ray luminosities seen from an Einstein survey of nine Algol-like systems are similar to those found by Pallavicini et al. for single or widely separated, rapidly rotating late stars but fall an order of magnitude below those seen from RS CVn stars with similar orbital periods and spectral types. It is concluded that the X-ray emission is most probably associated with a hot corona surrounding the secondary. Possible explanations for the lower luminosity of the Algol systems relative to the RS CVn systems are considered. (19 refs.)

69654 The magnetic field on the RS Canum Venaticorum star lambda Andromedae. M.S.Giampapa, L.Golub (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), S.P.Worden.
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L121-5 (15 May 1983).
A program to detect and measure magnetic flux on the surfaces of late-type stars is discussed. The authors adopt a technique to deconvolve magnetically insensitive lines from similar, magnetically sensitive lines to infer the degree of Zeeman splitting in the latter lines. These measurements yield values for the magnetic field strength and filling factor (flux). To illustrate their approach the authors present observations of the RS CVn star λ And. At the epoch of observation, 1981 April 26, they find a field strength of 1290±320 gauss covering 48%±7% of this star's surface. This measurement compares with an estimate of coronal magnetic flux in the cooler component of the stellar corona of 1110 gauss with a coronal volume filling factor of 75%, based on X-ray data for λ And. (22 refs.)

69655 X-ray evidence for white dwarf binaries in globular clusters. P.Hertz, J.E.Grindlay (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L83-7 (15 April 1983).
An apparently distinct class of low-luminosity ($L_x \sim 10^{32}$-10^{34} ergs s^{-1}) X-ray sources has been discovered in globular clusters from a survey with the IPC detector on the Einstein X-Ray Observatory. The sources appear to be pointlike, and several lie well outside of the cluster core, indicating that their masses are $\lesssim 1.0\ M_{\odot}$. These characteristics, together with previous studies of X-ray sources in globular clusters, make it likely that these sources are caused by accretion onto a white dwarf in a compact system. The luminosity function for these sources is consistent with that of galactic plane cataclysmic variables. The luminosity function for these sources is consistent with that of galactic plane cataclysmic variables. An extrapolation of the X-ray luminosity function to $L_x \lesssim N10^{31}$ erg s^{-1} indicates that a typical globular cluster contains $\sim 10^{1.3}$ white dwarf binaries. Assuming that these binaries form via the tidal capture (two-body) mechanism, the number of white dwarfs in a typical cluster must be $\sim 10^{4.1}$; this is consistent with globular cluster mass functions. (34 refs.)

69656 Definitive orbital elements of the visual double star ADS 5871-STF 1037. M.Scardia (Osservatorio Astron. di Brera, Merate, Italy).
Astron. Nachr. (Germany), vol.304, no.1, p.29-35 (1983).
Using a sample of 315 observations, the author computes the definitive orbital elements of the visual binary star ADS 5871-STF 1037. The provisional elements obtained by Kowalsky's method are corrected with the differential method of Hellerich. The author calculates the dynamical parallax of the system and its total mass. (21 refs.)

69657 New light curve analyses for the eclipsing binaries u Her and UV Leo. G.Giuricin, F.Mardirossian, M.Mezzetti (Osservatorio Astron. di Trieste, Trieste, Italy).
Astron. Nachr. (Germany), vol.304, no.1, p.37-40 (1983).
Using Woods's (1972) model the authors analyze two sets of photoelectric observations as yet unsolved, i.e. Rovithis's and Rovithis-Livaniou's (1980) B and V light curves of the semi-detached system u Her and Broglia's (1961) three-colour observations of the detached system UV Leo. The observations of u Her yield solutions in which the secondary's radius exceeds its Roche lobe. On the other hand, the new elements of UV Leo confirm the results of the most recent investigations, thus giving for the primary eclipse an unexpected occultation solution which hardly permits a simple picture of UV Leo. (35 refs.)

69658 Extreme surface activity on the cool component of the eclipsing binary FF Aquarii. J.D.Dorren, M.J.Siah, E.F.Guinan (Biruni Obs., Shiraz, Iran).
Inf. Bull. Variable Stars (Hungary), no.2305, p.1-4 (30 March 1983).
The eclipsing binary star FF Aquarii (=BD−3°5357) consists of a G8 III-IV component with strong Ca II H and K emission, and an OB-type subdwarf. The ultraviolet spectrum of the cool star alone shows strong chromospheric emission lines (e.g. Mg II h and k) and very strong transition region emission lines such as N V, C IV and C II. The authors report photoelectric photometry of FF Aquarii between July 1977 and August 1978 using the v,b and y filters of the Stromgren uvby system. The light curve is characterised by a wavelike variation with an amplitude of about 0.33 mag., in which the minimum and maximum of the wave occur at about phases 0.18 and 0.7 (for primary eclipse at phase 0.00). This light variation is similar to the quasi-sinusoidal photometric waves observed in RS Canum Venaticorum stars, and it is found that the light curve of FF Aquarii can, like the light curves of the RS CVn stars, to be fitted by a starspot model. It is concluded that about 42% of the surface of the G-type star is covered by starspots which are about 800K cooler than the stellar photosphere. (5 refs.)

69659 1980 light curve of II Pegasi. D.S.Hall, G.W.Henry (Dyer Obs., Vanderbilt Univ., Nashville, TN, USA).
Inf. Bull. Variable Stars (Hungary), no.2307, p.1-2 (8 April 1983).
The authors report V-band photometry of the RS Canum Venaticorum star II Pegasi on 25 nights in 1980. Magnitudes are listed for the period 1980 August 7 to November 12, and a light curve is presented. (1 ref.)

69660 1981 light curve of II Pegasi. R.D.Lines, H.Louth, H.J.Stelzer, D.S.Hall.
Inf. Bull. Variable Stars (Hungary), no.2308, p.1-2 (8 April 1983).
The authors report V-band photometry of the RS Canum Venaticorum star II Pegasi on 27 nights during 1981. V-band magnitudes for the period 1981 August 30 to November 13 are tabulated, and a light curve is presented. (2 refs.)

69661 1981-82 light curve of II Pegasi. G.W.Henry (Cloudcroft Obs., Cloudcroft, NM, USA).
Inf. Bull. Variable Stars (Hungary), no.2309, p.1-2 (8 April 1983).
The author reports differential V-band photometry of the RS Canum Venaticorum star II Pegasi on 19 nights between September 1981 and August 1982. The observed V-magnitudes are tabulated, and a light curve is presented. (1 ref.)

69662 Photoelectric observations of TY Del. D.R.Faulkner (Astron. Dept., Indiana Univ., Bloomington, IN, USA).
Inf. Bull. Variable Stars (Hungary), no.2310, p.1-2 (11 April 1983).
The author reports photoelectric UBV photometry of the Algol-type eclipsing binary star TY Delphini (BD+12°4539) on five nights during the autumn of 1982. Three times of minimum light are determined, and are used to calculate new light elements. (4 refs.)

69663 Photoelectric minima and period changes of CO Lacertae. J.M.Kreiner (Astron. Dept., Inst. of Phys., Silesian Univ., Katowice, Poland), M.Kurpinska-Winiarska, M.Winiarski.
Inf. Bull. Variable Stars (Hungary), no.2312, p.1-2 (15 April 1983).
The authors report photoelectric photometry of the eclipsing binary star CO Lacertae (BD+56°2857) for the period July 1981 to August 1982. Four times of light minimum (two primary eclipses and two secondary eclipses) are given. The (O−C) values are calculated for the observed minima, and the (O−C) curve is plotted for all the published photoelectric minima of CO Lacertae; it is concluded that the elements of Semeniuk (1967) are in good agreement with the observations. (7 refs.)

69664 Observations of the RS CVn star HD 26337 with the International Ultraviolet Explorer satellite. S.L.Baliunas, W.P.Blair, E.F.Guinan (Harvard-Smithsonian Centre for Astrophys., Cambridge, MA, USA).
Inf. Bull. Variable Stars (Hungary), no.2323, p.1-3 (26 April 1983).
HD 26337 (m=+7.05; G5 IV) is a single-line spectroscopic binary star (P=2.04414^d) with moderately strong Ca II H and K emission, and a small-amplitude variable star with a photometric period of 2.038^d. These properties are typical of RS Canum Venaticorum stars as defined by Hall (1976). The authors report observations of HD 26337 by the IUE satellite on four days between December 1982 and March 1983. The Fine Error Sensor on board the satellite was used as a photometer to measure the optical brightness of the star. It is found that the mean brightness of the star has decreased by 0.19 mag. from 1980-81 to 1982-83; in addition the amplitude of the light curve has decreased from about 0.16 mag. in 1980-81 to about 0.10 mag. in 1982-83. These changes imply that the area of the stellar surface that is covered by starspots has increased, and that there has been a net movement of the centres of the spots towards higher latitudes. Finally, ultraviolet observations of HD 26337 reveal moderately strong Mg II h and k (2800 Å) emission, indicative of a chromospherically active star. (9 refs.)

69665 The thirty-two year cycle in Algol. A.D.Mallama (Computer Sci. Corp., Silver Spring, MD, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.1-9 (1982).
Five new photoelectrically timed minima of Algol are reported: JD (hel.) 2443909.6538, 2444167.7182, 2444236.5321, 2444560.5340, and 2444623.6188. The ephemeris of Frieboes-Conde, Herczeg, and Hog (2434705.5493+2.86732442E^d) is still a good predictor if a correction term with 32-year periodicity is added. Apsidal motion is eliminated as the cause for the 32-year periodicity in the times of primary minimum because times of secondary minimum derived from observations in the literature do not fit that model, the deviation being at least 6 sigma. Likewise the 32-year effect appears to be unrelated to asymmetry in the light curve, at more than a 3 sigma confidence level. (24 refs.)

69666 A photoelectric light curve of AH Cephei. P.Hartigan, R.P.Binzel (Dept. of Phys. & Astron., Macalaster Coll., St. Paul, MN, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.21-4 (1982).
This B3-type eclipsing binary has a β Lyrae-type light curve of small amplitude. Between August 3 and November 24, 1978, 133 photoelectric observations of AH Cephei were obtained. A time of minimum derived from the mean light curve, JD$_{min}$ (hel.)=2442779.813±0.011 day, indicates the period may still be increasing. (3 refs.)

69667 AW Sagittarii—a neglected variable. W.B.Davie (Maria Mitchell Obs., Nantucket, MA, USA).
J. Am. Assoc. Variable Star Obs. (USA), vol.11, no.1, p.35-6 (1982).
AW Sagittarii, not observed since its discovery in 1904, has been identified and its variation has been confirmed. A finding chart is presented. Attempts to find a period are unsuccessful, largely due, it is thought, to the proximity of another star, also probably variable. (1 ref.)

69668 Relativistic conic sections. N.Spyrou (Astron. Dept., Univ. of Thessaloniki, Thessaloniki, Greece).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.363-74 (April 1983).
A classification of the possible types of the relative orbits of realistic binary stars in the post-Newtonian approximation of general relativity is presented. Definitions of the relativistic conic sections and their elements are proposed, generalizing the corresponding ones of classical celestial mechanics. The results are compared and contrasted with the classical ones and some new predictions of purely post-Newtonian origin and nature are presented. (30 refs.)

69669 LMC X-1: another massive binary?. J.B.Hutchings, D.Crampton, A.P.Cowley.
I.A.U. Circ. (USA), no.3791, 1 pp. (14 April 1983).
The authors report spectroscopic observations of the candidate star proposed by Pakull (IAUC 3472 (1980)) for LMC X-1. The star is found to be a spectroscopic binary of spectral type about 07 with a probable orbital period of 3.909 days. The orbital semiamplitude (about 65 km/s) and the presence of antiphased N III emission imply that the companion has a mass ≥3 M. (1 ref.)

69670 On the tidal spin up and orbital circularisation rate for the massive X-ray binary systems. G.J.Savonije (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands), J.C.B.Papaloizou.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.581-93 (May 1983).
Calculates the response of non-rotating main-sequence stars of 5, 10 and 20 solar masses to a periodic perturbing tidal potential. The fully non-adiabatic, but linearised, equations for the response are solved numerically. The results enable the spin up and orbital circularisation rates to be calculated for a wide range of orbital frequencies. The authors discuss the behaviour of these quantities for orbital parameters appropriate to the massive X-ray binaries. The spin up of the massive component appears to be rather inefficient in the calculations, unless the system could be locked into resonance. However, because the tidal torque is strongly concentrated in the outer layers these may be spun up (or for certain orbital frequencies spun down) much more efficiently. (21 refs.)

69671 The enigmatic composite system HD 45166—B8 V+qWR or SdO?. A.J.Willis (Dept. of Phys. & Astron., Univ. Coll. London, London, England), D.J.Stickland.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.619-35 (May 1983).
High- and low-resolution *IUE* ultraviolet spectroscopic observations of the binary system HD 45166, previously classified as qWR+B8 V, obtained at several epochs are presented. The UV spectra show a photospheric absorption spectrum from highly ionised species like Fe *v*, which with the observation of B8 V absorptions in the visible, confirms the binary nature of the system. UV

data obtained at different epochs show gross changes in the strengths of comparatively narrow emission lines in N IV, C III and He II. C IV λ 1550 shows a P Cygni profile indicating a significant stellar wind from the hot object in the system, with $v_\infty \sim 1200$ km s^{-1}. An analysis of the UV and visible continuum, which shows no apparent epoch variations, yields following parameters for the hot object: M_v, T_{eff}, log $L/L_\odot$, R, and M. The authors suggest that the hot stellar component may be an SdO rather than a qWR star. (26 refs.)

69672 Phase-dependent UV spectra of UX Ursae Majoris. A.R.King, J.Frank, R.F.Jameson, M.R.Sherrington (Dept. of Astron., Univ. of Leicester, Leicester, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.677-83 (May 1983).
Reports phase-dependent UV spectra of UX UMa. The behaviour of the continuum during eclipse is as expected for an optically thick accretion disc. The authors confirm that the C IV λ 1549 emission line is not eclipsed, and show that several other lines undergo partial or total eclipses. This behaviour is shown to be consistent with simple ideas about photoionized winds blown off the accretion disc: some parameters of the emission-line region are estimated. (11 refs.)

69673 Optical and IR light curves of VV Puppis. P.Szkody (Dept. of Astron., Univ. of Washington, Seattle, WA, USA), J.A.Bailey, J.H.Hough.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.749-57 (May 1983).
Presents optical (0.36-0.6 μm) light curves with time resolutions of seconds and infrared (IR) (1.25-2.2 μm) light curves with time resolutions of minutes for VV Puppis during a high state. The optical light curves show a single hump with largest amplitude in the V filter, while the IR light curves show a double hump sinusoidal variation. Flickering is evident in both the optical and IR light curves, with the largest amplitude in optical B light. Through subtraction of the low state fluxes from the high state values, the authors obtain a flux distribution of the accretion column which peaks at 0.55 μm and becomes ν^2 in the IR, consistent with current cyclotron models. Comparison of the observed IR variations throughout the orbit with the expected variations due to an M4 star heated by an accretion column at an inclination of 66° suggests that the IR light is a combination of the secondary star plus contributions from two emitting poles. (24 refs.)

69674 Confirmation of periodic radio outbursts from LSI+61° 303≡GT 0236+61. M.J.Coe, S.R.Bowring, A.J.Court, C.J.Hall, J.B.Stephen (Dept. of Phys., Univ. of Southampton, Southampton, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.791-4 (May 1983).
Radio data on GT 0236+61 at a frequency of 10.7 GHz have been obtained over the period 1981 May to 1982 April and the 26.52-day regular behaviour reported by Taylor and Gregory (1982) is confirmed. This source appears to be similar to several other long-period X-ray binaries such as Circinus X-1. (17 refs.)

69675 Ultraviolet spectroscopy of LSI+61 303. I.D.Howarth (Dept. of Phys. & Astron., Univ. Coll. London, London, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.801-10 (May 1983).
New *IUE* low-resolution spectroscopy of the X-ray/radio source LSI+61° 303 is presented and discussed, and previously reported data critically reassessed. There is no strong evidence for continuum variability; in particular, eight spectra covering the 1200-1950 Å region show a scatter of only ~3 per cent. There is some variability in the emission lines, possibly related to the star's shell activity. The C IV resonance doublet reveals a stellar wind with a terminal velocity of ~1400 km s^{-1}. The data are consistent with a 10 $R_\odot$, $T_{eff} \simeq 15500$K star at 2.3 kpc, reddened by $E(B-V)=0.75$. (21 refs.)

69676 Velocity standards that have variable velocities. I. HD 184467. R.D.McClure (Dominion Astrophys. Obs., Herzberg Inst. of Astrophys., Victoria, BC, Canada).
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.201-5 (March 1983).
Several standard-velocity stars have been found to have variable velocities, from observations over the last three years with the DAO radial-velocity spectrometer. HD 184467 is an IAU standard that has been found to be a double-line spectroscopic binary. Although the maximum velocity separation of the components is only 28 km s^{-1}, and the system is single lined for most of the velocity cycle, a good orbit solution could be obtained from these photoelectric observations. 97.90 OTHER TOPICS IN STELLAR ASTRONOMY

69677 The AAO JHKL′ photometric standards. D.A.Allen, T.A.Cragg (Anglo-Australian Obs., Epping, NSW, Australia).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.777-83 (May 1983).
Presents the *JHKL′* standard stars in use for photometry at the Anglo-Australian Observatory. They are equatorial or southern hemisphere objects $1.5<K<6$ comparison with other lists of standards is presented, and in particular with the Johnson photometric system. Some recommendations on the use of *JHKL′* standard stars are given. (13 refs.)

98.10 STELLAR DYNAMICS

69678 Stellar orbits in a triaxial galaxy. I. Orbits in the plane of rotation. T.de Zeeuw (Sterrewacht, Huygens Lab., Leiden, Netherlands), D.Merritt.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.571-95 (15 April 1983).
An approximation technique for solving the equations of motion in nonintegrable potentials is applied to the case of stellar orbits in the plane of rotation of a nonaxisymmetric galaxy. The technique consists of (a) expanding the potential about the origin up to quartic terms and (b) replacing the corresponding Hamiltonian by a simpler averaged Hamiltonian, for which the equations of motion admit exact solutions. An explicit expression is obtained for the nonclassical second integral, and the major families of closed orbits are delineated. The results of the analytical technique are compared with orbits calculated numerically in the plane of rotation of Schwarzschild's triaxial galaxy model. It is suggested that most triaxial potentials are probably describable as 1:1:1 resonances, a result which has important implications for the existence of equilibrium triaxial galaxies. (76 refs.)

98.20 STELLAR CLUSTERS AND ASSOCIATIONS

69679 Formation of OB clusters: W33 complex. A.D.Haschick (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), P.T.P.Ho.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.638-46 (15 April 1983).
OB star formation in the W33 complex is studied using radio continuum interferometry and the spectral lines of NH_3. Although OB star formation is extended on the scale of 10 pc, the most recent episode of star formation producing the most massive stars in the region is confined to a 1 pc core within the dense molecular gas. The clumpy appearance of the H II region is consistent with the interpretation that a cluster of OB stars has formed recently in the core of the molecular cloud. (32 refs.)

69680 Color-magnitude photometry of 47 Tucanae to $M_V=+9$. W.E.Harris (Phys. Dept., McMaster Univ., Hamilton, Ontario, Canada), J.E.Hesser, B.Atwood.
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L111-15 (15 May 1983).
The authors present a color-magnitude diagram, obtained with the Cerro Tololo Inter-American Observatory vidicon system in direct mode, for the main sequence of 47 Tucanae (=NGC 104=C0021−723), to a limiting magnitude of V=22 ($M_V=+9$). The observed scatter along the main sequence is $\sigma(B-V)=0.04$ mag, consistent with the internal errors of measurement. Isochrone fits with Vanden Berg's (1983) recent stellar models are consistent with his conclusion that 47 Tuc has an age of $15-18\times10^9$ yr and a heavy-element abundance $Z\approx0.006$. (35 refs.)

69681 Abundance analyses of main-sequence stars in a possible nitrogen deficient cluster NGC 6231. D.J.Lennon, P.L.Dufton.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.443-56 (May 1983).
24 early-type main-sequence stars were observed at moderate dispersion in the cluster NGC 6231 and atmospheric parameters deduced from their Stromgren photometry and H_γ and H_ϵ absorption lines. Equivalent widths were measured for lines of He I, C II, N II, O II and Mg II, and abundances deduced from comparison with LTE and non-LTE model atmosphere calculations. Evidence is found for a systematic nitrogen under-abundance of 0.3 to 0.4 dex relative to hydrogen and this is interpreted as being due to a nitrogen deficiency in the progenitor interstellar material. Possible explanations for the anomalous composition are discussed. (35 refs.)

69682 A numerical method for the study of the gravothermal instability in star clusters. E.Bettwieser (Univ. Sternwarte, Gottingen, Germany).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.811-31 (May 1983).
Describes a numerical method for studying the evolution of spherical one-component star clusters. This method employs numerical integration of the moment equations derived from the Boltzman equation. In order to close this system of equations it is assumed that the energy flux tensor can be derived from an appropriate heat conduction law. The author allows for a large anisotropy of the velocity distribution and includes relaxation effects which are evaluated using the Fokker-Planck theory. Detailed numerical results from a study of the evolution of Plummer's (1915) model are reported. The evolution has been followed to that point where the central density $\rho(0)$ increased by a factor of 10^{14}. Only in the late stages of evolution the core collapse rate $(\dot{\rho}/\rho)$ is a fixed fraction of the relaxation rate. The velocity distribution represented by six moments seems to approach a self-similar form. The comparison of different outer boundary conditions and with former work indicates that this form is independent of the structure of the outer halo. These results provide new evidence that core collapse and the onset of the homological phase in the late stages of it is due to the gravothermal catastrophe picture of Lynden-Bell and Wood (1968). 98.40 INTERSTELLAR MATTER; AND NEBULAE

69683 High-velocity outflow sources in molecular clouds: the case for low-mass stars. S.Beckwith (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA), A.Natta, E.E.Salpeter.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.596-602 (15 April 1983).
Using calculations of the evolution of single explosions and time-extended outflows in molecular clouds, the energy and time required to produce the

high-velocity molecular outflow observed in Orion are derived for spherical expansion models. The energy efficiency of extended outflows is somewhat greater than that of single explosions in producing the observed velocity, radius, and mass of the outflow, but the efficiencies differ by less than a factor of 2. From the number of sources of high-velocity outflow, the present age of each outflow, and estimates of incompleteness of the detections, the authors estimate a rate of outflow occurrence more than 3 times greater than the formation of stars more massive than 4 $M_\odot$. It is argued that low-mass stars are likely to produce the bulk of the outflowing regions in molecular clouds. (36 refs.)

69684 UV radiation field inside dense clouds: its possible existence and chemical implications. S.S.Prasad, S.P.Tarafdar (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.603-9 (15 April 1983).
It appears possible that cosmic ray excitation of the Lyman and Werner systems of the hydrogen molecule could maintain a chemically significant level of UV photon flux in the interior of dense clouds where interstellar UV radiation may not reach. This conclusion is based upon a simplified treatment of the radiative transfer problem, which actually tends to underestimate the radiation field. In particular, the predicted radiation field seems capable of recovering carbon from the CO reservoir by photodissociation at an order of magnitude faster rate than that possible via dissociative charge transfer from He^+ followed by neutralization of the C^+ ion. This is noteworthy in the context of high $N(C)/N(CO)$ ratios reported for several dense clouds. Furthermore, this radiation field may also provide a potentially viable means of releasing molecules from grain surfaces inside dark clouds. (20 refs.)

69685 X-ray ionization and the Orion molecular cloud. J.H.Krolik (Center for Space Res., MIT, Cambridge, MA, USA), T.R.Kallman.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.610-24 (15 April 1983).
The observed X-ray sources near the core of the Orion molecular cloud are sufficient to supply all the ionization that is needed to drive the molecular chemistry throughout that portion of the cloud in which the greatest density and diversity of molecular species is found. In small regions within that core, the ionization rate is so high that the molecular balance is significantly different from that in the bulk of the cloud core's volume. Equilibrium models are calculated to determine the dependence of molecular abundances on ionization rate, and an exemplary model is constructed to show how this data may be assembled to predict total column densities. (55 refs.)

69686 VLA observations of the $^2\pi_{3/2}J=3/2$ OH masers associated with Orion A. S.S.Hansen (Nat. Radio Astron. Obs., Charlottesville, VA, USA), K.J.Johnston.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.625-9 (15 April 1983).
The maser emission in the $^2\pi_{3/2}J=3/2$ $F=1\rightarrow2$ and $F=1\rightarrow1$ transitions of OH associated with Orion A was found to lie in an area 8″×3″ along a position angle of 70°. It is located in two clusters centered at velocities of 7 and 19 km s^{-1}, distributed symmetrically on either side of IRc2. The emission is consistent with the outflow of material from a central massive star associated with IRc2. The magnetic field in the OH maser region obtained from the positional coincidences of possible Zeeman pairs is ~3 milligauss. (12 refs.)

69687 The ionization structure of planetary nebulae. III. NGC 7009. T.Barker (Dept. of Phys. & Astron., Wheaton Coll., Norton, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.630-7 (15 April 1983).
For pt.II see ibid., vol.253, no.1, pt.1, p.167-73 (1982). Spectrophotometric observations of emission line intensities have been made in eight positions in the planetary nebula NGC 7009. For the six brightest positions, the coverage is from 1400 Å to 10,000 Å. Standard equations used to correct for the existence of elements in other than the optically-observable ionization stages give results over a wide range of ionization that are consistent and agree with abundances calculated using ultraviolet lines. (17 refs.)

69688 The Gum Nebula: new photometric and spectrophotometric results. A.Chanot, J.P.Sivan (Lab. d'Astron. Spatiale, CNRS, Marseille, France).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.19-25 (May 1983).
On the basis of 60°-field, Hα photographs, the Gum Nebula appears to be composed of two regions: a 36°-diameter circular main body which has a typical ring-like appearance, and faint, diffuse and filamentary extensions which merge with surrounding Hα background. The overall dimensions do not exceed about 50° in diameter. Quantitative analysis of the plates has provided us with the total number of Hα photons emitted by the nebula. The flux of Lyman continuum photons from γ^2 Vel and ζ Pup appears to be capable of maintaining the observed ionization. In over 300 directions toward the Nebula, the authors have measured the [N II] 6584/Hα, [S II] 6717, 6731/Hα, [S II] 6717/[S II] 6731 and [O III] 5007/Hβ line intensity ratios. (57 refs.)

69689 The Cygnus X region. XIII. The dark cloud between IC 1318b and c. H.J.Wendker, K.J.Schramm, C.Dieckvoss (Hamburger Sternwarte, Hamburg, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.69-76 (May 1983).
For pt.XII see ibid., vol.89, no.1/2, p.239-40 (1980). Presents new observations of the dark cloud between the emission nebulae IC 1318b and c in Cygnus. The H_2CO- and H I-absorption lines and the H 110α-emission line, together with data from the literature are used to elaborate on the nature of the dark cloud. The authors conclude that this dark cloud is the left-over of a much larger one, where star formation has ceased and where the dark cloud is being dissolved by an OB association, which is outlined by H II regions in the same line of sight. The authors also suggest in passing that the dark cloud may be the γ-ray source CG 0 78+01. (27 refs.)

69690 A search for optical polarisation of the Milky Way at $l=150°$ and $l=223°$. C.Leinert, I.Richter (Max-Planck-Inst. fur Astron., Heidelberg, Germany).
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.146-9 (May 1983).
The results of a search for polarisation of the Milky Way at $l=150°$ and $l=223°$ are reported. The observations, carried out with the Helios spacecraft, refer to an elongated field of view, 19°×2°, inclined at 43° with respect to the galactic equator. Taken as they are, the data indicate a small polarisation perpendicular to the galactic plane, the polarised intensity being $\approx 1S_{10}(V)$ at $l=150°$ and $\approx 2S_{10}(V)$ at $l=223°$. This is qualitatively similar but quantitatively lower than the results of earlier investigations. The results show that it is possible to get reliable observations of Milky Way polarisation by a spaceborne photometer in spite of the omnipresence of zodiacal light. (12 refs.)

69691 New polarisation measurements of HD 183143, HD 204827, and Cyg OB 2 Sch. No.12. A.Schulz (Max-Planck-Inst. fur Radioastron., Bonn, Germany), R.Lenzen.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.158-61 (May 1983).
Carries out measurements of linear polarisation of HD 183143, HD 204827, and Cyg OB2 Schulte No.12 in the spectral range of 0.3-1.1 μm obtaining accurate data which might be used in the future for instrumental calibrations. Combining them with published near infrared polarisation data for these 3 stars the authors find an excellent agreement with the wavelength dependence of interstellar polarisation given by Wilking et al. (1980) using a slightly changed width of the fit curve. (15 refs.)

69692 G29.7−0.3: another supernova remnant with an identity crisis. R.H.Becker (Phys. Dept., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), D.J.Helfand, A.E.Szymkowiak.
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L93-7 (15 May 1983).
New radio and X-ray observations of the galactic supernova remnant G29.7−0.3 show that it is composed of two spectrally distinct components: a steep-spectrum, incomplete shell 3′ in extent enclosing a flat-spectrum, X-ray emitting region 30″ across. Thus, G29.7−0.3 joins the ranks of supernova remnants which exhibit a combination of Crab-like and shell remnant attributes. The Crab-like core has the highest ratio of X-ray to radio luminosity of all the Crab-like remnants observed to date, suggesting that it is an extremely young object. (16 refs.)

69693 The Galaxy's 157 micron [C II] emission: observations by means of a spectroscopic lunar occultation technique. G.J.Stacey, S.D.Smyers, N.T.Kurtz, M.Harwit (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L99-102 (15 May 1983).
The authors have obtained a first, direct estimate of galactic [C II] 157 μm, fine-structure emission. At a galactic longitude of 8°, the peak power observed in a 7′×7′ field is $\sim 5\times10^{-9}$ W cm^{-2} sr^{-1}. The method used to detect this radiation involved chopping against the cold side of the Moon. In the next few years, higher resolution far-infrared spectroscopy should enhance the usefulness of occultation techniques for detecting faint, diffuse line emission. (19 refs.)

69694 PL 1547.3−5612: a pure nitrogen ring nebula. M.T.Ruiz (Dept. de Astron., Univ. de Chile, Santiago, Chile).
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L103-9 (15 May 1983).
A ring nebula of pure nitrogen has been found with a radius of 0.6 pc and at about 4 kpc from the Sun. The emission from the region inside the ring is of more normal composition, containing lines of H, O, S, and N. No obvious central star is seen. (3 refs.)

69695 High-density gas associated with 'molecular jets': NGC 1333 and NGC 2071. P.R.Schwartz, J.A.Waak, H.A.Smith (Naval Res. Lab., Washington, DC, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L109-14 (15 April 1983).
The authors have observed the high-density gas associated with broad-winged bipolar CO emission in NGC 1333 and NGC 2071 by mapping these objects in $C^{18}O$, $NH_3(1,1)$ and CS (J=3-2). The general structure of high-density interstellar gas near these objects is elongated orthogonal to the separation of the 'red' and 'blue' high-velocity CO components. This suggests that a stellar wind is interacting with a primary planar parent cloud, snowplowing material into a lumpy, high-density torus in the plane of the cloud and excavating a cavity containing high-velocity, low-density gas perpendicular to the plane of the cloud. (16 refs.)

69696 Positions of the SiO masers in Orion-KI: anisotropy on a scale of 70 AU. M.C.H.Wright, R.L.Plambeck (Radio Astron. Lab., Univ. of California, Berkeley, CA, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L115-20 (15 April 1983).
Using the Hat Creek interferometer the authors have measured the positions of the −5 km s^{-1} and +16 km s^{-1} features in the spectrum of the $v=1$, $J=2\text{-}1$ SiO maser ($\nu=86.243$ GHz) in Orion-KL. The mean position of the two features, measured relative to a set of reference quasars, is $\alpha(1950)=5^h32^m47.023^s\pm0.005^s$ $\delta(1950)=-5°24'23.65''\pm0.15''$. This position lies within the error bars of the best infrared measurements of the position of the infrared source IRc2. There is a small, but significant, difference in the positions of the two masers. The −5 km s^{-1} feature is offset by $\Delta\alpha\cos\delta=0.10''\pm0.01''$, $\Delta\delta=-0.10''\pm0.02''$ from the +16 km s^{-1} feature. This offset corresponds to a separation of 70 AU at the distance of Orion. The anisotropy in the maser source, at distances of only $\sim10^{15}$ cm from IRc2, strongly suggests that IRc2 is the source of the high-velocity molecular outflow in Orion. (9 refs.)

69697 Radiative association and the synthesis of long carbon chain molecules in interstellar clouds. D.R.Bates (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L121-4 (15 April 1983).
An attractively simple scheme by which molecules having long carbon chains are formed in interstellar clouds through the radiative association family $C_n+C^+\rightarrow C_{n+1}{}^+ + h\nu$ is examined. It is rejected as probably being much too inefficient. Other schemes involve the synthesis of a big molecule in a single step, as for example $NH_3+CH_3{}^+\rightarrow NH_3.CH_3{}^+ + h\nu$ on which related flow-tube experiments have been performed. Exothermic dissociative channels exist. It has been inferred from the experimental data that the branching ratios determined in the laboratory are applicable to interstellar cloud conditions. This inference is unjustified. If a competing exothermic channel exists, it will in general severely suppress the radiative association rate coefficient. (23 refs.)

69698 Three-micron spectrometry in Sharpless 106. P.M.Williams, W.J.Zealey (Royal Obs., Edinburgh, Hilo, HI, USA).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.433-41 (May 1983).
The strength of the 3.28 μm emission feature has been measured at 12 positions in the biconical nebula Sharpless 106. The correlation of line-strength with thermal continuum confirms the association of the 3.28 μm line carrier with the cool dust. This correlation holds across the HII region, including the ionisation fronts, over a four-fold range of linestrength. In contrast to the results reported in Orion, there is no evidence for preferential line formation where the H II region interacts with the molecular cloud. The correlation of 3.28 μm linestrength with Brackett linestrength at three beam positions away from the excitation source strengthens the view that the dust and gas are well mixed in Sharpless 106. (14 refs.)

69699 The collapse of a fast rotating interstellar gas cloud. S.Narita, D.McNally, G.L.Pearce, S.A.Sorensen (Dept. of Phys. & Astron., Univ. Coll., London, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.491-515 (May 1983).
Numerical simulations have been performed of the hydrodynamical collapse of an axisymmetric, isothermal cloud which is initially a uniform sphere in fast rigid-body rotation. The cloud undergoes repeated collapses and bounces. Each time it collapses, it becomes a highly flattened disc which is fairly homogeneous in the equatorial plane; an off-axis density wave appears, moves away from the centre and disappears. It is found that centrifugal bounces do not lead to the formation of a permanent ring-like structure contrary to the results of some other investigators. (17 refs.)

69700 Radio maps revealing shell structures in five supernova remnants. J.L.Caswell, R.F.Haynes, D.K.Milne, K.J.Wellington (Div. of Radiophys., CSIRO, Epping, NSW, Australia).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.595-601 (May 1983).
Five southern supernova remnants (SNRs) of small angular diameter (5-10 arcmin) have been mapped with the Fleurs synthesis telescope; at the resolution used (better than 1 arcmin) a shell structure can be seen in each remnant. One of the SNRs G342.p−0.2, is a faint source which the authors confirm as an SNR for the first time. This source and three others, G340.4+0.4, G340.6+0.3 and G341.9−0.3, lie close together on the sky; they have similar distance estimates of ~16 kpc and they all may be located in one of the spiral arms on the far side of the Galaxy. The fifth SNR, G352.7−0.1, although displaced from the others by more than 10°, is at a similar distance and is possibly in the same spiral arm. (19 refs.)

69701 Observations of the $3_{1,3}$-$2_{0,2}$ transition of SO_2. G.J.White (Dept. of Phys., Queen Mary Coll., London, England), J.P.Phillips.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.661-6 (May 1983).
The authors have measured the $3_{1,3}$-$2_{0,2}$ transition of SO_2 in W49, W51, Ori A and Sgr B2, and found SO_2 emission upper limits in a further seven sources. The total number of SO_2 molecules in individual clouds is found to range from $\sim 2\times 10^{51}$ to $\sim 10^{53}$, implying a relative abundance $X(SO_2)\sim 10^{-6}$ in Ori A, and lower limits varying from $X(SO_2)\sim 10^{-9}$ to $\sim 10^{-8}$ in the remaining sources. These results are briefly discussed within the context of current models of interstellar cloud chemistry. (20 refs.)

69702 Radio observations of the supernova remnant G 109.1−1.0. A.Downes (Cavendish Lab., Mullard Radio Astron. Obs., Cambridge, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.695-9 (May 1983).
The supernova remnant G 109.1−1.0 which contains a periodic X-ray point source, has been observed with the Effelsberg 100-m telescope at 2.7 GHz. The remnant has shell structure at both radio and X-ray wavelengths and the radio and X-ray maps show similar large-scale emission. No linearly polarized radio emission was detected. G 109.1−1.0 is one of three shell remnants in which the probable stellar remnant has now been found. (26 refs.)

69703 Detection of H_2 emission in Herbig-Haro object No.101. A.Brown (Dept. of Phys., Queen Mary Coll., London, England), T.J.Millar, P.M.Williams, W.J.Zealey.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.785-9 (May 1983).
Reports the detection of H_2 emission in the spectrum of HH 101. The line strength of the $\nu=1$-0 $S(1)$ line at 2.12 μm is $(4.2\pm 0.6)\times 10^{-17}$ W m^{-2} and indicates that a shock with a velocity of about 14 km s^{-1} is moving into a cloud of density about 10^3 cm^{-3} if Schwartz's model for Herbig-Haro objects is valid. (15 refs.)

69704 A survey of formaldehyde in the Cepheus OB3 molecular cloud. R.W.Few (Computer Aided Design Centre, Cambridge, England), R.J.Cohen.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.853-9 (May 1983).
The 1_{11}-1_{10} absorption line of formaldehyde at 6-cm wavelength has been surveyed over the region of the Cepheus OB3 molecular cloud, using the Jodrell Bank Mk II radio telescope (beamwidth 9×10 arcmin^2). The measurements have a velocity resolution of 0.27 km s^{-1} and an rms noise level of ~0.01K. The formaldehyde has a very clumpy distribution which is broadly similar to the CO distribution found by Sargent (1977, 1979). A total molecular mass of 1.9×10^4 $M_\odot$ is implied by the formaldehyde measurements. Cepheus A is not the dominant concentration in the formaldehyde map. The most massive formaldehyde concentration is Cepheus C, which has a mass of 3600 $M_\odot$. It appears to be stabilized by rotation. (19 refs.)

69705 Structure of the local interstellar medium and the line of sight to α Oph. F.Paresce (Arcetri Astrophys. Obs., Florence, Italy).
Nature (GB), vol.302, no.5911, p.806-8 (28 April 1983).
Points out that a surprising number of independent lines of observational evidence unambiguously imply the existence of a large, moderately dense ($n_H\geq 1$ cm^{-3}), cool ($T\simeq 70$K) cloud of interstellar gas lying between the Sun and α Oph, an A5V star located 16.7±0.8 pc away in the direction $l=32°$, $b=23°$. (32 refs.)

69706 The optical emission from the supernova remnant HB 3. R.A.Fesen, T.R.Gull (Lab. for Astron. & Solar Phys., Goddard Space Flight Center, Greenbelt, MD, USA).
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.196-200 (March 1983).
Reports finding a faint, complete optical shell structure visible on Hα+[N II] and [S II] interference-filter photographs that is coincident with the radio emission of the supernova remnant HB 3. This shell, if associated with the remnant, represents a more extensive optical structure for HB 3 than previously recognized. (21 refs.)

69707 Emission-line profiles for selected planetary nebulae and symbiotic stars, V1016 Cygni, and HM Sagittae. D.E.Welty (Yerkes Obs., Univ. of Chicago, Williams Bay, WI, USA).
Publ. Astron. Soc. Pac. (USA), vol.95, no.565, p.217-28 (March 1983).
Emission-line profiles are given for twelve planetary nebulae in Hα and for seven in [O III] λ5007, for four symbiotic stars in Hα, and for the emission objects V1016 Cyg and HM Sge in both Hα and λ5007. Expansion velocities generally between 10 and 30 km s^{-1} are estimated for the planetary nebulae; the profiles are similar in Hα and λ5007 in most cases for which both are available. The profiles for V1016 Cyg, HM Sge, and the symbiotic stars are much wider and in most cases exhibit variability and multiple components. In particular, the variations in the line profiles of V1016 Cyg and HM Sge are displaced and described. (49 refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

69708 The ultraviolet spectrum of the Seyfert galaxies NGC 3516 and NGC 5548. M.H.Ulrich, C.Boisson (European Southern Obs., Garching, Germany).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.515-27 (15 April 1983).
The two Seyfert 1 galaxies NGC 3516 and NGC 5548 have been observed with the International Ultraviolet Explorer. In both galaxies the ultraviolet continuum becomes harder when it brightens. Analysis of the emission lines permits the structure of the broad line region to be partially unravelled. In contrast to most quasar spectra, the C IV λ1550, Mg II λ2800 and C III λ1909 line have different profiles, with C IV being broader than Mg II which is broader than C III. The differences between the profiles provide evidence for the existence of at least three types of clouds with different physical conditions and different velocities; the physical conditions correlate with the velocities of the clouds. (45 refs.)

69709 H I observations of the high-velocity system in NGC 1275. J.H.van Gorkom, R.D.Ekers (Kapteyn Astron. Inst., Groningen, Netherlands).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.528-34 (15 April 1983).
An attempt to detect H I emission from the high-velocity system in the Seyfert galaxy NGC 1275 (Perseus A) is presented. The data were obtained with the Westerbork Synthesis Radio Telescope using a special calibration procedure to achieve high spectral dynamic range. The new upper limit of 2.4×10^9 $M_\odot$ for the total H I mass in this system makes it unlikely that it is a very late-type galaxy, but the limit is still not low enough to exclude galaxies of type Sc or earlier. A tentative detection of a new weak broad absorption feature is reported, and the implications of an observed 30% increase in the intensity of the strong absorption feature are discussed. (17 refs.)

69710 Further evidence for M87's massive, dark halo. D.Fabricant, P.Gorenstein (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.535-46 (15 April 1983).
X-ray data obtained with the Einstein Observatory imaging proportional counter (IPC), supported by data from other detectors aboard the Einstein Observatory and previous instruments, are used to accurately measure the distribution of mass surrounding M87 at large radial distances that are inaccessible to optical study. An essentially complete range of possible temperature profiles for the X-ray emitting gas is considered. (31 refs.)

69711 Thermal conduction and heating by nonthermal electrons in the X-ray halo of M87. W.H.Tucker, R.Rosner (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.547-50 (15 April 1983).
A hydrostatic model for the X-ray halo around the giant elliptical galaxy M87 is presented. By taking into account the processes of thermal conduction, and nonthermal heating by relativistic electrons in the radio lobes, a self-consistent hydrostatic model can be constructed. There is no need to invoke radiative accretion or the suppression of thermal conductivity. (17 refs.)

69712 Star bursts and the extraordinary galaxy NGC 3690. R.D.Gehrz (Wyoming Infrared Obs., Univ. of Wyoming, Laramie, WY, USA), R.A.Sramek, D.W.Weedman.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.551-62 (15 April 1983).
Optical, infrared, and radio observations are used to interpret the interacting galaxy system NGC 3690 (Markarian 171) in the context of exceptional episodes of star formation of a luminosity comparable to the brightest analogous episodes in galatic nuclei. Models for star formation with a range of parameters are presented to demonstrate consistent interpretations of the emission-line, far-infrared, and radio continuum fluxes as arising from the effects of large numbers of massive stars. (32 refs.)

69713 The radial distribution of H II regions in spiral galaxies. P.W.Hodge (Univ. of Washington, Seattle, WA, USA), R.C.Kennicutt,Jr..
Astrophys. J. (USA), vol.267, no.2, pt.1, p.563-70 (15 April 1983).
Examines the radial distribution of H II regions in the rectified planes of 37 galaxies. They group themselves into three broad classes: those with continually decreasing density outward, those with oscillating density, and those with doughnut-shaped density distributions. A correlation is found with absolute magnitude, which increases along the sequence. Most galaxies' outer H II region distributions show an exponential decrease in density, with a slope that is strongly correlated with Hubble type and absolute magnitude. A correlation is also found between Hubble type and the size of H II region density fluctuations, in the sense that later Hubble types show smaller differences in H II region density. (34 refs.)

69714 Are there correlations between radio and optical axes of radio galaxies?. M.J.Valtonen (Turku Univ. Obs., Turku, Finland).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.207-15 (Feb. 1983).
The relative orientations of radio and optical axes of radio galaxies have been examined on the basis of combined material from several smaller samples. Rotation axes of some radio galaxies have been redetermined assuming that the published measurements refer to rotational motions only. It is found that the rotation axis is quite different from those previous determinations, where rotation-expansion models were used. In particular, the correlation between radio source axes and rotation axes disappears when the allowance for expansion is dropped. No statistically significant correlation between optical major axes of the galaxy image and radio source axes is found when all existing measurements, now exceeding 140, are combined. (27 refs.)

69715 Pairs of spiral galaxies with magnitude differences greater than one. H.Arp (Mount Wilson & Las Campanas Obs., Carnegie Instn. of Washington, Pasadena, CA, USA), E.Giraud, J.W.Sulentic, J.P.Vigier.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.26-8 (May 1983).
For isolated physical pairs of spiral galaxies in Karachentsev's (1972) catalog, the authors show that where the difference in brightness is greater than one magnitude, the fainter galaxy has a significantly higher redshift on the average. This result confirms, in an independent sample of morphologically similar galaxies, the result which has come from every other test of companion galaxies—that they are systematically higher in redshift than the brighter galaxy. (20 refs.)

69716 Periodic orbits and warps. W.A.Mulder (Sterrewacht, Huygens Lab., Leiden, Netherlands).

Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.91-6 (May 1983).

Orbit calculations are carried out in a rotating triaxial system having a density distribution in accordance with recent observations of spiral galaxies. A search is made for simple closed orbits that are tilted with respect to the equatorial plane of the galaxy. A new family of stable prograde tilted orbits is found which can explain warps as almost stationary phenomena. The results give strong support to Binney's (1978, 1981) proposal that warps can be excited by orbital instability. A scenario is described in which gas in the equatorial plane slowly spirals inwards, is fed onto the prograde tilted orbits by orbital instability and eventually ends up as high-velocity clouds due to the intersection of the more inclined orbits. (23 refs.)

69717 Observations of the interacting galaxy pair NGC 4490/85. U.Klein (Max-Planck-Inst. fur Radioastron., Bonn, Germany).

Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.150-2 (May 1983).

The interacting galaxy pair NGC 4490/85 (Arp, 269) has been observed with the Effelsberg 100-m telescope at 24.5 GHz. The radio emission at that frequency is strongly correlated with the regions of ionised gas that can be seen in Hα. The fraction of thermal emission at 1.2 cm wavelength is $38\pm12\%$. This suggests that also an appreciable amount of non-thermal emission originates in the H II complexes of this double system. Supernovae resulting from tidally triggered star formation bursts must be the sources of relativistic electrons. Some 2×10^5 O 5 stars are required to account for the observed production rate of Lyman continuum photons. The derived present star formation rate is consistent with models of galaxy evolution. (10 refs.)

69718 Physical properties of the intergalactic medium and the Lyman-alpha absorbing clouds. J.P.Ostriker, S.Ikeuchi (Princeton Univ., Princeton, NJ, USA).

Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L63-8 (15 May 1983).

Following the interpretation of Sargent et al. (1980) that the Lyα absorbing systems seen in quasars are due to intergalactic clouds confined by the pressure of a general intergalactic medium, the authors determine the physical properties of that medium and of the clouds on the basis of a variety of theoretical and observational constraints, with best estimates of the present intergalactic pressure and temperature being $P/k=10^{-2\pm0.2}$ cm^{-3}K and $T=10^{4.5\pm0.5}$K. Both the clouds and the background intergalactic medium have a density too low to be cosmologically interesting. At the same time, it is shown that a model of the intergalactic medium based on UV heating fails and that some explosive events must have occurred which shock-heated the medium during the epoch $z=3\sim7$. The authors propose three specific, if difficult, observations to check the interpretation developed: a search for the He$^+$ Gunn-Peterson line at 304 Å, a better determination of the Doppler width of the normal Lyα lines, and a search for low equivalent width Lyα lines. (16 refs.)

69719 Detection of $10^{10}M_\odot$ of hot gas in the normal elliptical galaxy NGC 5846 with the Einstein satellite. P.Biermann (Max-Planck-Inst. fur Radioastron., Bonn, Germany), P.P.Kronberg.

Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L69-73 (15 May 1983).

Reports the detection of $\gtrsim1.2\times10^{10}M_\odot$ of hot gas in the elliptical galaxy NGC 5846. The gas density, temperature, cooling time, and luminosity in the 0.5-4.5 keV band are reported. A number of conclusions can be drawn: the X-ray luminosity conforms to the predictions of Silk and Tarter; the pressure of the hot gas provides a means to confine jets; the origin of the gas can be understood in the framework of the galactic wind theory, and thus both supernova heating and stripping are important processes for removing gas from a galaxy. At the center of NGC 5846, there is a cooling flow which probably results in both star formation of low-mass stars and fueling of the weakly active nucleus. (36 refs.)

69720 Dwarf elliptical galaxies. H.Gerola (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), P.Carnevali, E.E.Salpeter.

Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L75-8 (15 May 1983).

The authors propose that dwarf elliptical galaxies are the bound remnants of more massive stellar systems, such as a parent galaxy which has lost more than half its mass in gas ejection during a burst of star formation, or an unbound tidal debris produced during the interaction of two giant galaxies. N-body calculations were performed to study the evolution of stellar systems with positive energy. The results indicate the existence of a power-law relation between the mass and the density σ of the fragments over a large range of values of σ, consistent with recent observational evidence. The calculations predict a mass-metallicity relation for the fragments. The amount of unbound material in the Virgo Cluster that is genetically connected with its dwarf elliptical galaxies is not detectable at present. (15 refs.)

69721 VLA observations of massive star formation in spiral nuclei. J.L.Turner, P.T.P.Ho (Dept. of Astron., Univ. of California, Berkeley, CA, USA).

Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L79-83 (15 May 1983).

The authors utilize both the spectral and spatial information in high-resolution radio continuum maps to decouple thermal emission due to H II regions from the extended, strong synchrotron emission found in galactic cores. A first-order analysis, assuming constant spectral indices across the maps, yields thermal fluxes to within a factor of 2. The presence of large numbers of H II regions and young stars in the nuclear regions of three nearby spiral galaxies is confirmed. (18 refs.)

69722 The gas density and distribution within 2 parsecs of the galactic center. R.L.Brown (Nat. Radio Astron. Obs., Charlottesville, VA, USA), K.J.Johnston.

Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L85-8 (15 May 1983).

The galactic center has been mapped with the VLA using a configuration optimized to emphasize low surface brightness features. It is found that the emission within 50″ of the galactic center is a superposition of thermal and nonthermal radiation. In broad outline both the nonthermal source and the smaller region of extended thermal emission have the same morphology: they appear elliptical with their major axes aligned along $b=2.77'$ and with their centroids at or very near the position of the compact radio source Sgr A*. In addition, dense clumps of thermal emission appear to define a spiral-like pattern which also has its center of symmetry within 2″ of Sgr A*. The gradients in gas density, synchrotron emissivity and velocity dispersion outward from Sgr A* suggest that we are viewing a transient phenomenon such as an inflating supernova remnant whose age is ~7500−22000 years. (10 refs.)

69723 The strength of Paschen-alpha in the Seyfert 1.9 galaxy V Zwicky 317. R.J.Rudy (Steward Obs., Univ. of Arizona, Tucson, AZ, USA), S.P.Willner.

Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L69-71 (15 April 1983).

Reports a measurement of the Paschen-α flux in the Seyfert 1.9 galaxy V Zwicky 317. Seyfert 1.9 galaxies are characterized by steep broad-line Balmer decrements and V Zw 317 has the steepest decrement (Hα/Hβ=15.1) of any member of this class yet studied. The Paα is less than one-sixth the case B value modified by reddening. Thus for the object, and possibly for the class as a whole, reddening alone cannot account for the observed line ratios. Radiative transfer effects are probably the dominant factor in producing the observed broad-line Hα/Hβ value. Recent models suggest that the required optical depths, temperatures, and densities in the broad-line region necessary to produce such a steep Balmer decrement are smaller than those thought typical for quasars. (20 refs.)

69724 Position angle variation of the major axis of some galaxies. A.I.Gamaleldin, I.A.Issa (Helwan Obs., Cairo, Egypt).

Astron. Nachr. (Germany), vol.304, no.1, p.21-8 (1983).

The variation in the direction of the major axis in three ellipticals, five lenticulars and three spirals is studied using B or V isophotic maps. There is a turning point in most of the curves especially for spirals and lenticulars. This turning point can be used to define the galaxy nucleus region. There seems to be a correlation between the rotation curve and the postion angle curve especially for NGC 2784 and NGC 3640. (8 refs.)

69725 Stellar statistical analysis in the neighbourhood of the Sun. N.G.Guseva, L.N.Kolesnik (Akad. der Wissenschaften, Kiev, Ukrainian SSR), M.D.Metreveli.

Astron. Nachr. (Germany), vol.304, no.1, p.41-4 (1983).

Space densities for stars in the 'Catalogue of nearby stars' (Gliese 1969) and in 'Nearby star data published 1969-78' are calculated as a function of distance from the galactic plane. The stars are symmetrically distributed with respect to the galactic plane. Space densities for giant stars nearer than 22 pc are also computed. The comparison between the luminosity functions of stars nearer than 5 pc and 22 pc shows that the number of M dwarfs up to 22 pc is incomplete. (11 refs.)

69726 The UV spectrum of the BL Lac object PKS 0521−36. I.J.Danziger (European Southern Obs., Garching Munchen, Germany), J.Bergeron, R.A.E.Fosbury, L.Maraschi, E.G.Tanzi, A.Treves.

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.565-70 (May 1983).

Ultraviolet observations (1200-3000 Å) with the *IUE* satellite of the BL Lac object PKS 0521−36 are presented. The only emission line which appears clearly in the spectrum is Lyα, which is asymmetric with a component displaced ~3000 km s^{-1} to the red. The intensity of the line and the upper limits on other lines are compared with the model calculations on QSOs and Seyfert nuclei by Kwan & Krolik (1981). The continuous energy distribution is discussed, combining non-simultaneous observations from the ultraviolet to the infrared. The spectral range of the non-thermal source from far IR to far UV can be described by a single power law of index −1.5. (24 refs.)

69727 Stochastic effects in the chemical evolution of galaxies. S.D.M.White (Dept. of Astron., Univ. of California, Berkeley, CA, USA), J.Audouze.

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.603-18 (May 1983).

Uses a simple model of mixing processes to investigate how fluctuations in element abundance in the interstellar medium may affect the chemical evolution of galaxies. The authors present a complete solution for the abundance distribution in a schematic inhomogeneous steady-state model in which infalling gas replaces material consumed by star formation. In addition, they give differential equations which describe the evolution of certain moments of the abundance distribution in more general models, together with a Monte Carlo scheme which can be used to simulate this evolution. The authors compare results for inhomogeneous generalisations of the infall model of Lynden-Bell with data on the abundance distribution of stars and gas in the solar neighbourhood. (21 refs.)

69728 An arcsec radio jet in NGC 1275 (Perseus A). A.Pedlar, R.V.Booler, R.D.Davies (Nuffield Radio Astron. Labs., Jodrell Bank, England).

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.667-75 (May 1983).

Presents 73-cm radio continuum observations of NGC 1275 with an angular resolution of 1.2 arcsec. The observations show an unresolved core together with two weaker knots which the authors interpret as a radio jet in position angle ~160°. This jet may be associated with an optical filament in PA 172° which aligns precisely with the 2.8-cm VLBI jet and shows an unusually high velocity-gradient. This filament could be formed by the cooling of gas entrained into a beam in PA 172°. If this hypothesis is correct, then the radio knots are displaced 2→3 arcsec (~1kpc) from the axis of the beam. (27 refs.)

69729 Infrared colours of a complete sample of faint galaxies. R.S.Ellis (Dept. of Phys., Durham Univ., Durham, England), D.A.Allen.

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.685-93 (May 1983).

Re-examines the infrared colour-redshift relation for galaxies of known redshift. The relation defined by measurements of optically selected galaxies lies fairly close to that expected from model predictions. Infrared colours may therefore offer a reasonable method for separating the effects of luminosity evolution and redshift when discussing optically selected samples of faint field galaxies. This method is applied to a complete sample of 47 field galaxies at optical magnitude 21.5. The infrared and optical data imply that a third of the field galaxies lie at redshifts beyond those expected from non-evolution models. The optical-to-infrared colours of these distant galaxies are generally bluer and the entire sample is consistent with a more vigorous star formation rate beyond a redshift of ~0.5. (21 refs.)

69730 Rotation curve of the edge-on spiral galaxy NGC 5907: disc and halo masses. S.Casertano (Scuola Normale Superiore, Pisa, Italy).

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.735-47 (May 1983).

The dynamical consequences of a truncation in the disc of a spiral galaxy, like that suggested by the sharp decline of luminosity observed in the outer parts of some edge-on galaxies, are investigated, in relation to the interpretation of observed velocity curves. The disc truncation leaves a 'signature' on the rotation curve, in the form of a region of nearly constant velocity, followed by a steep decline of velocity just outside the truncation. Such a feature is clearly present in the observed rotation curve of NGC 5907, in which the luminosity truncation is also present. The observed velocity curve of NGC 5907 can be well reproduced by a two-component model, with a smooth spherical distribution of 'dark mass' (a halo) superimposed on the luminous disc. The best-fitting values for the mass in the disc and in the halo (inside the optical truncation) are 9 and 13.5×10^{10} solar masses, respectively. The mass-to-light ratio (luminosity in the J band) is about 11, in solar units. The model predicts the values of some quantities, such as the thickness of the gas layer, that could possibly be observed in the near future, thus providing a clear-cut test of the model itself. (18 refs.)

69731 Remarkable kinematics of the ionized gas in the nucleus of NGC 1365. M.M.Phillips, A.J.Turtle (Anglo-Australian Obs., Epping, NSW, Australia), M.G.Edmunds, B.E.J.Pagel.

Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.759-65 (May 1983).

The nuclear region of NGC 1365 shows emission from (i) H II regions ionized by young stars; (ii) a central Seyfert nucleus; and (iii) extended regions of high-excitation gas with [O III] 5007$\gg$Hβ, presumably located outside the disc of the galaxy and ionized by far-UV radiation and soft X-rays from the nucleus. New high-dispersion spectroscopic observations reveal a velocity field that is considerably more complicated than the simple rotating disc previously inferred from observations of Hα and [N II], particularly in the case of the high-excitation gas which shows non-circular or non-coplanar motion and line splittings over substantial areas. Preliminary interpretations are suggested involving either rotation in a tilted plane or ejection into the halo. (23 refs.)

69732 A dust lane in NGC 6251. J.-L.Nieto, G.Coupinot (Obs. du Pic-du-Midi et de Toulouse, Bagneres-de-Bigorre, France), G.Lelievre, C.Madsen.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.39p-43 (May 1983).
A dust lane cutting the central region of the radio galaxy NGC 6251 along its minor axis has been observed. This dust lane is roughly parallel to the radio jet. The implications of this observation are discussed. (27 refs.)

69733 Related galaxies with different redshifts?. H.C.Arp (Mount Wilson Obs., Pasadena, CA, USA).
Sky & Telesc. (USA), vol.65, no.4, p.307-9 (April 1983).
Various examples of these peculiar systems are discussed. The nature of the companions is briefly discussed. The existence of quasars associated with galaxies is also discussed. (no refs.)

69734 A survey of galaxy redshifts. V. The two-point position and velocity correlations. M.Davis (Dept. of Astron. & Phys., Univ. of California, Berkeley, CA, USA), P.J.E.Peebles.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.465-82 (15 April 1983).
Describes the results of a study of the two-point correlations in the 14.5 m_B Harvard-Smithsonian Center for Astrophysics redshift survey. The distance information provided by the redshifts is used to estimate the two-point spatial correlation function $\xi(r)$ in a way that is designed to be unbiased by peculiar velocities. The results agree well with what has been found from the deeper angular distributions. (46 refs.)

69735 A new evaluation of the four-point galaxy correlation function amplitudes. J.N.Fry (Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).
Astrophys. J. (USA), vol.267, no.2, pt.1, p.483-7 (15 April 1983).
Applies the method of Bonometto and Lucchin (1980) for estimating the reduced four-point function amplitudes to the Lick galaxy count catalog, uses earlier results to test the expected scaling behavior, and summarizes the present state of knowledge of these parameters. (11 refs.)

69736 Neutral hydrogen in X-ray cluster galaxies: A 1367. G.L.Chincarini (Univ. of Oklahoma, Norman, OK, USA), R.Giovanelli, M.Haynes, P.Fontanelli.
Astrophys. J. (USA), vol.267, no.2, pt.1, p.511-14 (15 April 1983).
21 cm observations of X-ray galaxies in the cluster Abell 1367 show that the neutral hydrogen gas may coexist with the hot coronal X-ray gas. Such galaxies, however, are neutral hydrogen deficient. (3 refs.)

69737 The geometry of two superclusters Coma-A1367 and Perseus-Pisces. G.L.Chincarini (Dept. of Phys. & Astron., Univ. of Oklahoma, Norman, OK, USA), R.Giovanelli, M.P.Haynes.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.5-9 (May 1983).
An attempt is made to estimate the mean extension in depth of two large structures Coma-A1367 and Perseus/Pisces. These superclusters are favorable cases for such measurements because their longest dimension runs approximately perpendicular to the line of sight. A preliminary estimate gives for Coma-A1367, a mean width $\simeq$14 Mpc and a mean depth $\simeq$16 Mpc. For Perseus/Pisces the authors obtain a mean width $\simeq$12 Mpc and a mean depth $\simeq$24 Mpc. (20 refs.)

69738 Extended H I emission associated with the low-surface-brightness companions of the S0 galaxy NGC 4026. P.N.Appleton (Nuffield Radio Astron. Labs., Univ. of Manchester, Jodrell Bank, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.533-44 (May 1983).
An H I survey has been made of the S0 galaxy NGC 4026 and its nearby low-surface-brightness companions. Although the S0 galaxy was not detected in H I, filamentary neutral hydrogen was found in its near vicinity associated with the companion galaxies UGC 6956 and 6922. The distribution and kinematics of the gas strongly suggests that tidal interactions are taking place in this system. It is likely that the S0 galaxy dominates the gravitational potential of the group and is tidally stripping gas from its nearest companion UGC 6956. The outcome of this interaction may be the formation of an H I ring around NGC 4026 on a time-scale of 10^7-10^8 yr. It is suggested that the tidal capture of gas from small companion galaxies like UGC 6956 could provide a mechanism for the origin of outer H I rings in other S0 galaxies. (27 refs.)

69739 The Horologium-Reticulum supercluster of galaxies. J.R.Lucey (Astron. Centre, Univ. of Sussex, Brighton, England), R.J.Dickens, R.J.Mitchell, J.A.Dawe.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.545-63 (May 1983).
Redshifts, morphological classifications, orientations and ellipticities are presented for 129 galaxies with a 6°×6° region in Horologium-Reticulum centred on 3^h27^m, −53.5°. The survey shows that the prominent clusters in the region form a supercluster with a mean redshift around 18000 km s^{-1}. The region is dominated by two very rich clusters Cl 0329-527 (Klemola 8) and Cl 0342−538 (Calan 0340−538) which are separated by a projected distance of 8 h^{-1} Mpc ($h=H_0/100$ km s^{-1} Mpc^{-1}). The line-of-sight velocity dispersion of these clusters is discussed. Redshifts indicate that there is a bridge of galaxies connecting Cl 0342-538 to the prominent aggregate Cl 0326−537 which lies to the south-west of Cl 0329−527. The galaxy position angles are discussed. A simple two-particle model, assuming masses derived from the application of the viral theorem to each of the two very rich clusters is considered and the properties of the individual supercluster components are discussed. (31 refs.)

69740 An observational study of the dynamics of binary galaxies. S.D.M.White (Dept. of Astron., Univ. of California, Berkeley, CA, USA), J.Huchra, D.Latham, M.Davis.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.701-25 (May 1983).
Presents high quality radial velocities for all galaxies in Turner's (1976) catalogue of 156 binary systems. The observed velocity differences depend significantly on the environment of pairs and on the morphological type of their member galaxies. Velocity difference correlates extremely weakly with either luminosity or projected separation. Monte Carlo simulations of scale-free ensembles of binary galaxies show that this behaviour is inconsistent both with the hypothesis that the mass of a binary system increases linearly with its luminosity, and with the hypothesis that galaxies in pairs may effectively be treated as point masses. The data favour models where the galaxies interact through a quasi-isothermal potential which depends only weakly on their luminosity. (40 refs.)

98.70 OTHER OBJECTS AND BACKGROUND RADIATIONS OF UNKNOWN ORIGIN AND DISTANCES

(for pulsars, see 97.60G)

98.70D Discrete radio sources

69741 A variable radio source in the clumpy irregular galaxy Markarian 297. D.S.Heeschen (Nat. Radio Astron. Obs., Charlottesville, VA, USA), J.Heidmann, Q.F.Yin.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L73-6 (15 April 1983).
Six centimeter VLA observations of the clumpy irregular galaxy Markarian 297 (=NGC 6052) show that a compact source within the galaxy image increased by a factor of 3 in a time interval of 27 months. The authors suggest that the increase is due to supernova activity in a small region of extraordinary star formation activity within the galaxy. (12 refs.)

69742 High spatial resolution VLA observations of the R Aquarii jet. M.Kafatos (Dept. of Phys., George Mason Univ., Fairfax, VA, USA), J.M.Hollis, A.G.Michalitsianos.
Astrophys. J. Lett. Ed. (USA), vol.267, no.2, pt.2, p.L103-7 (15 April 1983).
High spatial resolution observations (~1″) of the jet feature associated with the symbiotic variable R Aquarii were obtained with the Very Large Array (VLA). The peak radio intensity of the jet lies at 29.3° PA with respect to the radio emission from R Aquarii itself. If the line defined by the jet and star is extended ~196″, it intercepts a previously reported and theretofore unresolved radio source. In the high spatial resolution 6 cm map, this feature is resolved into a compact double radio source, whose peak intensity lies on an axis defined by the jet and star. The possible association of this feature with R Aquarii or with the extended filamentary nebula that surrounds the system cannot be determined from these radio morphology studies alone. If this feature is associated with R Aquarii, it may represent ejecta from the system which occurred previously. Moreover, a new unresolved radio feature has been detected ~2.7″ from the central star at ~45° PA. It may represent material recently ejected from the system, perhaps as the object precesses. Weak evidence for a counter-jet suggested from radio contours centered on R Aquarii. (11 refs.)

69743 Infrared counterparts to 'empty field' steep-spectrum radio sources. M.J.Lebofsky, G.H.Rieke (Steward Obs., Univ. of Arizona, Tucson, AZ, USA), D.Walsh.
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.727-34 (May 1983).
A sample of steep-spectrum radio sources from the Jodrell Bank survey, which correspond to empty fields on the POSS has been observed using the Multiple Mirror Telescope IR photometer with a 9 arcsec diameter aperture positioned on the radio centroids. This technique has previously been successful with flat-spectrum sources, which are normally relatively compact, but has been thought to be inappropriate for steep-spectrum sources because they are usually extended and the position of the optical/IR counterpart may be too uncertain. Of a sample of 18 'empty field' sources, new detections have been made at K of 11 which, with four previous detections, gives a success rate of 15 out of the 18 sources and brings the optical/IR detection rate of a complete sample of 87 sources close to 100 per cent. For some detected sources magnitudes at J and H have also been determined, and it is shown that the IR colours can be used to classify objects. The sample apparently includes galaxies with z~1 and QSOs with very steep optical-IR spectra. (21 refs.)

69744 Asymmetries in four powerful radio sources. C.J.Lonsdale, I.Morison (Nuffield Radio Astron. Labs., Jodrell Bank, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.833-51 (May 1983).
The extragalactic radio sources 3C 153, 196, 249.1 and 268.4 have been observed at frequencies of 408 and 1666 MHz with the new MERLIN array operated by Jodrell Bank, giving resolutions of ~0.9 and 0.25 arcsec respectively. The sources show marked asymmetries about the central object in spectral index, flux and morphology, which are most naturally accounted for by the effects of a time-dependent asymmetry in the central powerhouse. In the case of 3C 249.1 the observations suggest that energy is being supplied alternately to the two sides of the source. The 1666-MHz observations also show that each of the other three sources contains one extremely compact hotspot. The minimum internal energy densities in these hotspots are such that confinement by ram pressure of motion through the intergalactic medium may not be possible, indicating that such features are transient phenomena in free expansion, or that some other confinement mechanism is operating. (31 refs.)

69745 Large-scale radio structures of superluminal sources. R.T.Schilizzi, A.G.de Bruyn (Radiosterrenwacht, Dwingeloo, Netherlands).
Nature (GB), vol.303, no.5912, p.26-31 (5 May 1983).
Westerbork Synthesis Radio Telescope maps of faint extended emission associated with several superluminal radio sources are presented. In order to avoid exceptionally large sizes for the superluminal sources, their dominant, long-term axes must be at least 20-30° from the line of sight. This is a considerably larger angle than that demanded by the relativistic beaming interpretation of the superluminal motion in their compact cores, and implies that a wobble or precession of their ejection axes has taken place. Superluminality may thus be a temporary phenomenon. (31 refs.)

69746 A measurement of the IR flux from a radio lobe. P.M.Allan (Sterrewacht Leiden, Leiden, Netherlands).
Nature (GB), vol.303, no.5912, p.45-6 (5 May 1983).
Prompted by the detection of optical radiation from the extended lobes and jets of some radio galaxies, the author has begun a search for IR radiation from such sources. Initially the author has observed the western lobe of 3C 247 (or 3C 247W) at 2.2 μm and measured a flux density of 250±27 μJy (m_K=16.0±0.1). This result shows there to be a break in the spectrum between radio and optical wavelengths, such that the IR-optical spectrum is steeper than would be predicted from the radio and optical data alone. If the spectrum of 3C 247W is applicable to other sources, then IR searches are a good way of finding high frequency counterparts of lobes of radio galaxies. (21 refs.)

98.70J Quasars

69747 Common absorption systems in the spectra of the QSO pair Q0307−195A, B. P.A.Shaver (European Southern Obs., Garching, München, Germany), J.G.Robertson.
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L57-61 (15 May 1983).
Common metal absorption systems have been found in the spectra of the SQOs Q0307−195A and B (separation 58″) at z=2.122, the emission redshift of the latter; the projected separation is 378 h^{-1} kpc, and the absorption redshifts differ from each other by only 77±14 km s^{-1}. This result, and that found previously for the pair Q0028+003/Q0029+003, strongly suggest the presence of very large (Mpc-diameter) gaseous halos or disks surrounding QSOs. Another pair of common metal absorption systems has also been found at a considerably lower redshift, z_{abs}=2.034. The redshift difference in this case is 297±14 km s^{-1} and the projected separation 376 h^{-1} kpc; the absorption may be due to one or possibly two foreground galaxies. A marginal tendency has been found among the remaining Lyα lines in the two spectra to correlate with each other at small velocity separations (≤500 km s^{-1}). (6 refs.)

69748 3C 273. P.A.R.Ade, I.G.Nolt, E.I.Robson, M.G.Smith.
I.A.U. Circ. (USA), no.3795, 1 pp. (29 April 1983).
Recent millimetre, submillimetre and infrared photometry of the quasar 3C 273 show that the source has flared over the year 1982-83. For example the 1.1 mm flux density increased from 12 Jy in April 1982 to 22 Jy in February 1983 and to 37 Jy in March 1983. The observations suggest that the flare may have propagated from the infrared to successively longer wavelengths. (no refs.)

69749 Optical positions of quasars. E.D.Clements (Royal Greenwich Obs., Hailsham, England).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.861-3 (May 1983).
Positions with an accuracy of about 0.1 arcsec are presented for 65 quasars observed with the 26- and 13-in refractors at the RGO. (6 refs.)

69750 On the Baldwin effect in optically-selected quasars. T.Kiang, F.H.Cheng, Y.Y.Zhou (Dunsink Obs., Castleknock, Dublin, Ireland).
Mon. Not. R. Astron. Soc. (GB), vol.203, no.2, p.25p-9 (May 1983).
Osmer (1980) has asserted that the apparent correlation between emission-line width and continuum luminosity (the Baldwin effect) in an optically-selected set of quasars could be due to observational selection effects. The data are divided into groups according to spectral index α and it is found that for the groups $0.0<\alpha<0.3$ and $0.8<\alpha<2.4$, the correlation is tight (dispersion ~0.7 mag.) and the points lie clear of the calculated cutoff. These 73 quasars define a mean relation $M_{cont}=18.28+3.77$ (log W_{em}-1.50), which differs little from the mean relation found in a radio-selected sample. (16 refs.)

69751 Multifrequency observations of OV 236 (1921−293) reveal an unusual spectrum. W.K.Gear (Dept. of Phys., Queen Mary Coll., London, England), E.I.Robson, P.A.R.Ade, M.J.Griffin, M.G.Smith, I.G.Nolt.
Nature (GB), vol.303, no.5912, p.46-7 (5 May 1983).
Examines the radio source OV 236 (1921−293) which has been classified both as a quasar and a BL Lac object. Its polarization and variability at 2.2 μm and generally featureless optical spectrum are consistent with it being a BL Lac object. The authors have obtained J, H, K, 10, 20, 800 and 1100 μm flux measurements of 1921−293 over a period of four days from the same telescope, enabling them to present a 'snapshot' of its IR to millimetre spectrum. 98.70Q X-ray and gamma-ray sources

69752 On the nature of two gamma bursts with spectral evolutions observed by the KONUS experiment. E.P.Liang (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Astrophys. J. Lett. Ed. (USA), vol.268, no.2, pt.2, p.L89-92 (15 May 1983).
Several unique features of the evolving spectra of the 1979 April 2 B and 1979 November 11 gamma-ray bursts observed by the KONUS experiment can be used to determine a number of critical parameters of the sources, within the context of the thermal synchrotron model, including their luminosity distances. These results shed much light on the origin of these events and possibly of gamma bursts in general. (10 refs.)

98.70V Background radiations

69753 Radio source contributions to small-scale anisotropies of the microwave background. L.Danese (Osservatorio Astron., Padova, Italy), G.De Zotti, N.Mandolesi.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.114-18 (May 1983).
Presents calculations of radio source contributions to anisotropies in the microwave background on angular scales $1'\lesssim\theta_0\lesssim10°$. The uncertainties are small for $\lambda\geq6$ cm and $\theta_0\gtrsim10'$, where the fluctuation level follows directly from the available counts, and probably do not exceed a factor of 2 over this whole range of angular scales for $\lambda\geq2$ cm. The authors find that for $\lambda\lesssim3$ cm and $5'\lesssim\theta_0\lesssim2°$ radio sources yield $\Delta T/T\gtrsim10^{-4}$ and therefore seriously limit the detectability of truly primordial anisotropies. (37 refs.)

69754 Gravitational scintillation, anisotropies of background radiation and density inhomogeneities of cosmic matter. Fang Lizhi (Astrophys. Res. Div., Univ. of Sci. & Technol. of China, Hefei, China).
Sci. Sin. (China), vol.26, no.3, p.297-305 (March 1983).
The stochastic component in density inhomogeneities of cosmic matter can cause the intensity scintillation of sources at cosmological distances. This scintillation effect is one of the origins of the small angular anisotropy in the microwave background. That is, the density inhomogeneities in the epoch after the recombination would also contribute to the formation of background anisotropy. Therefore, an upper limit for the density inhomogeneities of cosmic matter can be obtained by the observation of the small angular anisotropy of background radiation. The result is that, if the Universe is closed, a strong inhomogeneity has never been evolved in the distribution of total density (including visible and invisible matter), namely, even at the present the total density distribution might still be rather homogeneous. (14 refs.)

Radio-astronomy antennas for 3K cosmic radiation measurements .... See Entry 69497

98.80 COSMOLOGY

(for observational cosmology, see 98.70V; for origin and evolution of galaxy, see 98.50)

69755 General vacuum-Universe solutions in Brans-Dicke cosmology. P.Chauvet (Dept. de Fisica, Univ. Autonoma Metropolitana, Mexico City, Mexico).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.51-8 (Feb. 1983).
By a rescaling of the scalar field ϕ of the Jordan-Brans and Dicke cosmology, the general solutions of the Friedmannian ‘vacuum’ Universe are obtained. Only the flat space solution was previously known. Each solution is characterized by the sign of the second time derivative of the rescaled field $\psi \equiv \phi R^3$ (R being the scale factor of the Robertson-Walker line-element): $\ddot{\psi}=0$ (flat space), $\ddot{\psi}<0$ (closed space), and $\ddot{\psi}>0$ (open space), so that the solutions are mutually exclusive. Of these, the open space one is damped-oscillatory and R attains its absolute minimum, equal to zero, in only one of the two ‘extreme’ cycles. Otherwise, R min remains positive. If the ϕ-field is dominant near the singularity, these solutions may have physical significance. Also obtained, by the method mentioned above, is the general flat space solution for a ‘dust’ Universe and from it a closed space ‘dust’ solution. Both were found before by different authors, each one using a different method and, therefore, seemed up to now unrelated. (7 refs.)

69756 Robertson-Walker cosmologies with a trace anomaly effect in their dynamical description. A.Woszczyna (Astron. Obs., Jagiellonian Univ., Krakow, Poland).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.75-8 (Feb. 1983).
The evolution of some vacuum spatially-flat Robertson-Walker universes filled with a massless conformally-invariant quantum field is presented in the energy density-curvature phase plane. (3 refs.)

69757 Parastatistics and the equation of state for the early Universe. R.Aldrovandi, I.Monte Lima (Inst. de Fisica Teorica, Sao Paulo, Brazil).
Astrophys. & Space Sci. (Netherlands), vol.90, no.1, p.179-95 (Feb. 1983).
The equation of state for an ideal mixture of relativistic quantum gases obeying any (para-)statistics is given. Recursion formulae are obtained for the distribution function and correlations are analysed. The equation of state can be applied to the early Universe, allowing the quarks to be treated either as coloured fermions or (unequivalently) as parafermions of order 3. In the latter case, they exhibit a tendency to aggregate into triads by a mere statistical effect. (18 refs.)

69758 Early Brans-Dicke axisymmetric Universe with magnetic field. S.P.Chakravarti (Phys. Dept., B.N. Mahavidyalaya, Bengal), U.K.De.
Astron. & Astrophys. (Germany), vol.121, no.1, pt.1, p.1-4 (May 1983).
The Brans-Dicke-Maxwell field equations in the presence of a magnetic field are sold for an axisymmetric metric in a radiation dominated early Universe. An expression for the magnetic energy-density is obtained. It is concluded that primordial magnetic fields may have had a profound effect in producing anisotropies of the Universe and in primordial element production. (8 refs.)

69759 On the behaviour of test matter in the neighbourhood of caustics of homogeneous cosmological models. H.G.Paul (Zentralinst fur Astrophys., Akad. der Wissenschaften, Potsdam-Babelsberg, Germany).
Astron. Nachr. (Germany), vol.304, no.1, p.13-19 (1983).
Using power asymptotes for the metric of Bianchi types I, V, VII$_0$, VIII and IX, the intensity of geodesic focused scalar test matter is calculated in the neighbourhood of the caustic singularities of these space-time models. In all the considered Bianchi types there is a caustic diffraction with a diffraction field bounded by regions of extinction depending on the structure of the gravitational lense. (16 refs.)

69760 Newtonian cosmology and Friedmann's equation. A.R.Thatcher.
Eur. J. Phys. (GB), vol.3, no.4, p.202-5 (1982).
Models of the expansion of the Universe can be derived from Newton's laws by the methods of hydrodynamics. The author shows that if the galaxies are regarded as discrete particles then an even simpler presentation is possible. It is also noted that a relativistic Universe which contains only a finite amount of matter may be indistinguishable, within the limits of observation, from a Friedmann Universe in which the total amount of matter is infinite. (5 refs.)

69761 Cosmology and elementary particles. J.D.Barrow (Astron. Centre, Univ. of Sussex, Brighton, England).
Fundam. Cosmic Phys. (GB), vol.8, no.2, p.83-199 (1983).
An introduction is provided to the growing amalgamation of elementary particle physics and big bang cosmology. An overview is given of the observational evidence for the content, composition and distribution of matter and radiation in the Universe. The theory of the standard Friedman model is developed and used as a testing ground for a variety of hypotheses regarding the existence and properties of elementary particles. In particular, the survival of massive neutrinos, charged leptons, quarks and hadrons is considered. The experimental evidence for massive neutrinos and the variety of astrophysical consequences of their existence are described. Nucleosynthesis in uniform, nonuniform and anisotropic models is described along with the limits that can be placed upon the number of neutrino generations by considering the synthesis of helium and deuterium. Analogous limits from particle physics are given. The rationale and evidence for a grand unification of fundamental forces is described. The generation of a nonzero baryon number in the early Universe is reviewed and shown to have consequences for the origin of galaxies. Finally, new developments concerning the ‘inflationary Universe’ and the astrophysical consequences of superheavy magnetic monopoles are outlined. (222 refs.)

69762 General solutions for a cosmological Robertson-Walker metric in the Brans-Dicke theory. J.M.Cervero, P.G.Estevez (Dept. de Fisica Teorica, Univ. de Salamanca, Salamanca, Spain).
Gen. Relativ. & Gravitation (USA), vol.15, no.4, p.351-6 (April 1983).
The general vacuum solutions of the Brans-Dicke theory in a cosmological Robertson-Walker-type metric are explicitly given. Several families of solutions have properties which essentially differ from the conventional Einstein theory. The geometry is not uniquely determined by the equations of motion, raising doubts about the ‘Machian’ character of the Brans-Dicke theory. The role of the cosmological constant is emphasized, in agreement with modern ideas of fundamental particle interactions. (10 refs.)

69763 Friedmann Universe and superluminal Dirac particles. S.K.Srivastava (Government Coll., Port Blair, India).
J. Math. Phys. (USA), vol.24, no.4, p.996-1000 (April 1983).
Superluminal Dirac particles are considered in a Friedmann Universe. It is concluded that if such particles were produced at the epoch of the big bang (as assumed by Narlikar and Sudarshan) and also that they survived up to the present time, their metamass should be less than 8.77×10^{-54} g. It is also concluded that the wavelength of these primordial tachyons (superluminal particles surviving to present time) would be greater than 4.56×10^{-23} cm. In this paper expressions for various physical parameters such as probability density and energy and rate of dissipation of energy for these particles are derived. (8 refs.)

69764 Nonlinear periodic waves in a self-gravitating fluid. D.Ray (Dept.of Phys. Dept., Queen Mary Coll., London, England).
J. Math. Phys. (USA), vol.24, no.4, p.1011-12 (April 1983).
Liang (1979) has obtained equations for nonlinear plane waves in a Jeans Universe. While Liang has studied the equation for a specific equation of state, this paper makes a general study. Among other things it is shown that only a subsonic propagation is possible. (1 ref.)

69765 Possibility of detecting relict massive neutrinos. V.F.Shvartsman, V.B.Braginskii, S.S.Gershtein, Ya.B.Zel'dovich, M.Yu.Khlopov (M.V. Keldysh Inst. of Appl. Math., Acad. of Sci., USSR).
JETP Lett. (USA), vol.36, no.6, p.277-9 (20 Sept. 1982). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.36, no.6, p.224-6 (20 Sept. 1982). [received: April 1983]
The coherent intensification of the interaction of relict massive neutrinos with grains of matter with a size on the order of the neutrino wavelength suggests that it might be possible to detect a galactic neutrino sea by virtue of the mechanical pressure which it exerts in the direction opposite that in which the solar system is moving in the Galaxy. (17 refs.)

69766 The rest mass of neutrinos and clustering in the early Universe. Fang Lizhi (Astrophys. Res. Div., Univ. of Sci. & Technol. of China, Hefei, China).
Kexue Tongbao (Foreign Lang. Ed.) (China), vol.27, no.12, p.1301-4 (Dec. 1982).
The clustering of matter in the early Universe would be substantially affected by neutrinos with nonzero rest mass. The author considers this influence on Jeans clustering. (7 refs.)

69767 The future of the Universe. D.N.Page, M.R.McKee (Pennsylvania State Univ., University Park, PA, USA).
Mercury (USA), vol.12, no.1, p.17-23 (Jan.-Feb. 1983).
The authors discuss the future of the Universe from a thermodynamic viewpoint. It is shown that if the density of the Universe is less than or equal to the critical density (i.e. for a hyperbolic Friedmann model with $k=-1$ or a flat Friedmann model with $k=0$) the Universe never reaches thermal equilibrium. However, in the $k=0$ Friedmann model the entropy of the Universe may increase without limit owing to the formation and annihilation of positronium and the coalescence and evaporation of black holes. The implications of this state of thermal disequilibrium and unlimited increase in entropy for the continued existence of life in the Universe are discussed. (no refs.)

69768 Asymptotic freedom and entropy in a perpetually oscillating Universe. M.A.Markov (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.94A, no.9, p.427-9 (4 April 1983).
A model of a perpetually oscillating Universe is considered. In this model the Universe, when contracting to Planck dimensions, transforms from the Friedmann to the De Sitter phase with one and the same $\Lambda \sim 1/l_{\mathrm{Pl}}{}^2$, irrespective of the value of the total bare mass of the Friedmnan Universe. (9 refs.)

69769 The opacity of the universe and the strong equivalence principle. V.M.Canuto, I.Goldman (NASA, Goddard Space Flight Center, New York, NY, USA).
Phys. Lett. A (Netherlands), vol.95A, no.1, p.65-8 (11 April 1983).
A possible explanation of why the advanced (i.e. acausal) solutions of Maxwell's equations are not observed in nature is by way of absorption by an opaque Universe. As Davies (1977) has shown, the ever expanding, general relativistic cosmological models fail to provide the needed absorption. This is perhaps not surprising. In fact, the absorption mechanism calling for an interplay between local physics and cosmology, is usually developed adopting the strong equivalence principle, SEP, which precludes such interplay. The authors show that complete absorption of electromagnetic radiation by ionized intergalactic plasma is obtained provided a violation of the SEP, of the order of the Hubble's constant, is allowed to occur. The same degree of violation was previously found to be compatible with a large body of observational data. (14 refs.)

69770 The early Universe and high-energy physics. D.N.Schramm (Dept. of Astron. & Astrophys., Univ. of Chicago, Chicago, IL, USA).
Phys. Today (USA), vol.36, no.4, p.27-33 (April 1983).
Many properties of the new particle field theories can only be tested by comparing their predictions about the physical conditions immediately after the Big Bang with what one can reconstruct about this event from astronomical data. (15 refs.)

69771 Massive, degenerate neutrinos and cosmology. K.Freese (Astron. & Astrophys. Centre, Univ. of Chicago, Chicago, IL, USA), E.W.Kolb, M.S.Turner.
Phys. Rev. D (USA), vol.27, no.8, p.1689-95 (15 April 1983).
Modifications to the standard big-bang neutrino cosmology resulting from a nonzero chemical potential are discussed. Cosmological neutrino mass limits as a function of μ/T are derived. Implications for galaxy formation in a Universe with degenerate neutrinos are emphasised. (16 refs.)

69772 Stability and structure of Newtonian gravitars. I.S.Nurgaliev (M.V. Lomonsov Moscow State Univ., Moscow, USSR).
Sov. Phys. J. (USA), vol.25, no.7, p.672-5 (July 1982). Translation of: *Izv. VUZ Fiz. (USSR)*, vol.25, no.7, p.98-102 (July 1982). [received: May 1983]
The solution $\chi \sim r^2$ for a scalar field (gravitational ‘constant’), which is asymptotically exact for supercompact configurations and which Saakyan and Mnatsakanyan obtained from the numerical solution of the hydrostatics equations in the Newtonian approximation of the Jordan-Brans-Dicke theory, is

used to study the gravitational stability of such configurations. The author has found that the stability condition $\gamma \geq 2/3$ for polytropic configurations (γ is the polytropic exponent) instead of $\gamma \geq 4/3$, which is known for configurations of low compactness. Analytic solutions of the equations of internal structure are found for configurations which are intermediate with respect to stability ($\gamma = 2/3$) and for some other important series of configurations. (9 refs.)

BIBLIOGRAPHY INDEX

Active role of solvent in chemical reactivity, (57 refs.) ... 68757
Aligned ferrous superalloys, (51 refs.) ... 68610
Anisotropic rotational diffusion of an α helix and analysis of the internal motion of side chains, (58 refs.) ... 66166
Atom-molecule reactive scattering, (54 refs.) ... 68770
Atomic collisions in presence of strong radiation fields, (68 refs.) ... 66094
Atomic spectroscopy multiplex methods, (62 refs.) ... 68814
Auger lineshape analysis, (72 refs.) ... 68369
Behaviour of the AB_2 type compounds at high pressures and high temperatures, (278 refs.) ... 64600
Cardiac computed tomography, (54 refs.) ... 69010
Chalcogenide glasses in As-S system for quantum electronics, (55 refs.) ... 66360
Cluster studies of CO adsorption, (52 refs.) ... 67344
Coherent phenomena during the interaction between light pulses and resonance media, (87 refs.) ... 66347
Collective spontaneous emission theory, (98 refs.) ... 66247
Compilation of coupling constants and low-energy parameters: 1982 edition, (240 refs.) ... 64599
Computerised tomography, (166 refs.) ... 69014
Computerised tomography, (71 refs.) ... 69044
Computerised tomography, (67 refs.) ... 69045
Cosmology and elementary particles, (222 refs.) ... 69761
Dibaryon resonances, (68 refs.) ... 65162
Diffuse phase transitions, (49 refs.) ... 67159
Disordered solid structure—methods of study, (64 refs.) ... 66836
Double passage of wave in inhomogeneous media, (75 refs.) ... 64703
Einstein-Maxwell field equations solutions, (85 refs.) ... 64798
Electrochemical measurements in flowing solutions, (103 refs.) ... 68700
Electron capture collisions, (74 refs.) ... 66123
EM radiation of relativistic channelling particles, (176 refs.) ... 67082
Explosion-driven shock tubes, (100 refs.) ... 66650
Feldspar-liquid geothermometer, (61 refs.) ... 69201
Ferroelectromagnets, (162 refs.) ... 68133
Finite series-expansion reconstruction methods, (71 refs.) ... 69017
Fission barriers in heavy nuclei, (116 refs.) ... 65297
Flow-induced vibrations in reactors and components, (240 refs.) ... 65502
Fluid dynamics computational methods, (307 refs.) ... 66547
Fusion reactor first wall, irradiation creep, (68 refs.) ... 65666
Gas mixing within the acinus of the lung, (56 refs.) ... 68955
Gauge treatment of gravity, (118 refs.) ... 64812
H, excited states, electron capture, (55 refs.) ... 66127
Heat capacity and other thermodynamic properties of acrylic polymers, (56 refs.) ... 64601
Hg liquid-vapour interface, computer simulation, (86 refs.) ... 67310
Holography, coherent light amplification and phase conjugation, (174 refs.) ... 66240
Infrared multiphoton decomposition and energy-dependent adsorption cross sections of chloroethane-d_0, -2-d_1, and -2, 2, 2-d_3, (63 refs.) ... 68784
Kinetic theory of non-equilibrium fluid, (61 refs.) ... 66794
Light echo in gases, (56 refs.) ... 66348
Linear theory of cold bounded plasma, (54 refs.) ... 66674
Liquid-vapour interface, pseudoatom theory, computer simulation, (126 refs.) ... 67179
Magnetic properties of Ni, Fe and Co films with S impurities, (63 refs.) ... 67982
Magnetoresistance in weakly localized regime, (49 refs.) ... 67655
Metal hydride properties, (50 refs.) ... 67266
Metallic glasses, (75 refs.) ... 66862
Microseisms of meteorologic and ocean origin, (64 refs.) ... 69123
Multistate vibronic coupling, (57 refs.) ... 65957
Negative ions and atoms collisions, (106 refs.) ... 66120
Neuromuscular system, identification techniques, (65 refs.) ... 68952
Normal coordinate analysis treatment on uracil in solid state, (64 refs.) ... 68233
Normative data of knee joint motion and ground reaction forces in adult level walking, (55 refs.) ... 68968
NP 0532 and activity of Crab Nebula, (53 refs.) ... 69638

Nuclear reactors, flow induced vibrations, (240 refs.) 65312
Palaeomagnetic data anal. using time series, (107 refs.) 69369
Paramagnetism of FeSi, (50 refs.) 67889
Photoemission from MBE grown III-V surfaces and interfaces, (62 refs.) 68406
Photon echo studies of resonance media, (74 refs.) 66346
Polarization spectroscopy of gaseous media by the photon-echo method, (56 refs.) 64957
Projected ranges and effective stopping powers of electrons with energy between 20 eV and 10 keV, (54 refs.) 67081
Properties of small metal particles, (217 refs.) 68801
Quantised light field, (92 refs.) 66248
Quantum-chemical calculation of NMR chemical shifts, (178 refs.) 66028
Quark matter in relativistic ion collisions, (55 refs.) 65227
Quartet system of Ii I, (62 refs.) 65916
Rare earth compounds, fluorescence spectra and crystal field analysis, (82 refs.) 68286
Reconstruction algorithms, (102 refs.) 69016
Solar wind He abundance, (67 refs.) 69466
Storm depositional systems palaeogeography, (134 refs.) 69330
Strongly nonlinear internal gravity waves, (55 refs.) 69225
Structure of the influenza virus glycoprotein antigen neuraminidase at 2.9 Å resolution, (52 refs.) 68922
Suboptimal control of logic of large scale linear quadratic problems, (56 refs.) 65310
Superplasticity, (139 refs.) 68589
Supersymmetric mass hierarchies, (77 refs.) 65017
Temperature dependence of far IR spectra of L-alanine, (52 refs.) 68234
Toroidal plasma LHR heating, (144 refs.) 66718
Triaxial galaxies, (76 refs.) 69678
UCLA Tokamak edge-plasma properties, (59 refs.) 66753
Valence band SCF calculation;, (54 refs.) 65853
White dwarf progenitors, (92 refs.) 69605
Wide-line NMR in polymers, (91 refs.) 68049
Work hardening laws, (56 refs.) 68565

BOOK INDEX

Progress in boundary element methods. Vol.2; *C.A.Brebbia (editor/s),* [Plymouth, England: Pentech Press 1983] 64606
Sky atlas 2000.0; W.Tirion, [Cambridge, England: Cambridge 1981] 69514

CONFERENCE INDEX

105th Meeting of the Acoustical Society of America; Cincinnati, OH, USA, 9-13 May 1983, [Spring 1983] 64577 (introductory abstract),
American bimechanics; Seattle, WA, USA, 13-15 Oct. 1982, [1983] 64578 (introductory abstract),
Antennas and propagation; Norwich, England, 12-15 April 1983, [London, England: IEE 1983] 69314, 69420−33
Application of accelerators in research and industry; Denton, TX, USA, 8-10 Nov. 1982, *(DOE; NSF; D.A.R.P.A.; Naval Surface Weapons Centre; NBS; et al)* [April 1983] 64644, 64889, 65668, 65684−7, 65694−712, 65724−9, 65772−804, 65819, 65825−8, 65840−1, 65918−19, 65931, 65935, 66105−11, 66149−50, 67015−21, 67034, 67055−8, 67070−4, 67286, 67293, 67386−7, 68384−6, 68690, 68705−6, 68763−4, 68818−35, 68913, 68925, 69001−6, 69021−3, 69034−5, 69049−52, 69068−77, 69150, 69372−6, 69502
Electrochemical techniques in corrosion testing and research; Manchester, England, 4-6 Jan. 1982, [1983] 64576 (introductory abstract), 68681−5, 68698−701
Electron microscopy; Grahamstown, South Africa, 1-3 Dec. 1982, [Johannesburg, South Africa: Electron Microscopy Soc. Southern Africa 1982] 64591 (introductory abstract),
Electron rings for nuclear physics research; Lund, Sweden, 5-7 Oct. 1982, [Lund, Sweden: Univ. Lund 1982] 64587 (introductory abstract), 65210, 65218, 65251, 65254−6, 65692, 65732−9, 65809−17, 65820−4
Fracture and NDT in reactor materials; Stuttgart, Germany, 14-15 Oct. 1982, [Stuttgart, Germany: Staatliche Materialprufungsanstalt Universitat Stuttgart 1982] 64588 (introductory abstract), 65356−8
Grain boundaries in semiconductors; Boston, MA, USA, Nov. 1981, *H.J.Leamy, G.E.Pike, C.H.Seager (editor/s),* [New York, USA: North-Holland 1982] 67413, 67618−19, 67775, 67803, 67825, 68893
High energy physics, 1982; Mysore, India, 6-11 Dec. 1982, [Bombay, India: Dept. Atomic Energy 1982] 64598 (introductory abstract), 65062−5, 65077, 65092−8, 65119−20, 65124−31, 65136−7, 69460
High energy spin; Westhampton Beach, NY, USA, Sept. 1982, [1982] 64572 (introductory abstract), 64909, 64994−7, 65005, 65108−11, 65162−72, 65177, 65180−1, 65184, 65195−7, 65230, 65252, 65257−9, 65270, 65292−3, 65665, 65716−23, 65740−69, 65837
High-temperature electronics; London, England, 23 March 1983, [London, England: IEE 1983] 64597 (introductory abstract), 65570, 69392
In situ composites; Boston, MA, USA, 16-19 Nov. 1981, *F.D.Lemkey, H.E.Cline, M.McLean (editor/s),* [North-Holland: New York, USA 1982] 64592 (introductory abstract), 66937, 67315, 68436, 68477−80, 68498, 68501, 68509−10, 68531−3, 68571−3, 68584, 68609−13, 68655−9
Insulation; Odense, Denmark, 1982, [Stockholm, Sweden: ASEA 1982] 64590 (introductory abstract), 66775−9, 68115
Integrated global monitoring of environmental pollution; Tbilisi, USSR, Oct. 1981, [1982] 64575 (introductory abstract),
International Society of Photogrammetry and Remote Sensing, Commission VII International Symposium; Toulouse, France, 13-17 Sept. 1982, [Toulouse, France: Groupement pour le Developpement de la Teledetection Aerospatiale 1982] 64586 (introductory abstract), 69110, 69189, 69205, 69209−16, 69249−52, 69263, 69313, 69328, 69331−2, 69388−91
Magnetic films and surfaces; Yokohama, Japan, 13-16 Sept. 1982, [March 1983] 64579 (introductory abstract), 67348, 67564, 67716, 67808, 67849, 67866, 67870, 67896, 67972−80, 67990, 68034−6, 68097
Magnetism, Kyoto; Kyoto, Japan, 6-10 Sept. 1982, [Feb. 1983] 67935−6
Meteoritical Society 45th annual meeting; St. Louis, MO, USA, 13-16 Sept. 1982, [1982] 64581 (introductory abstract),
Nonlinear fluid behavior; Boulder, CO, USA, 7-11 June 1982, [March 1983] 64582 (introductory abstract), 66169, 66583, 66599−601, 66619−20, 66794−6
Nuclear reactor thermal hydraulics; Santa Barbara, CA, USA, 11-14 Jan. 1983, *(ANS; ASME; AIChE) M.Merilo (editor/s),* [LaGrange Park, IL, USA: ANS 1982] 64589 (introductory abstract), 65324−35, 65496−569, 65581−662, 66579, 66625−6
Nuclear waste management; Boston, MA, USA, 16-19 Nov. 1981, *S.V.Topp (editor/s),* [New York, USA: North-Holland 1982] 65359−442
Nuclear waste management V; Berlin, Germany, 7-10 June 1982, *W.Lutze (editor/s),* [New York, USA: North-Holland 1982] 64593 (introductory abstract), 65443−70
Nucleus-nucleus collisions; East Lansing, MI, USA, 26 Sept.-1 Oct. 1982, *(U.S. Dept. Energy.; NSF; IUPAC; et al)* [East Lansing, MI, USA: Michigan State Univ. 1982] 65217, 65234−5, 65250, 65269, 65276−91, 65300−1, 65303
Optical detection of magnetic resonances in solids; Leningrad, USSR, 6-8 April 1981, [1982] 64957, 66346−53, 66421, 68078−9, 68083, 68289−90, 68367
Photovoltaic solar energy; Stresa, Italy, 10-14 May 1982, *W.H.Bloss, G.Grassi (editor/s),* [Dordrecht, Netherlands: Reidel 1982] 67226, 67545, 67648, 67699, 67774, 67824, 68856, 68876−92
Physics and physical metallurgy of electromechanical steels and alloys; Asha, USSR, 15-17 Sept. 1981, [1982] 64574 (introductory abstract), 67242, 67951−5, 67959−65, 68526, 68534, 68552−8, 68566
Physics of non crystalline solids; Montpellier, France, 5-9 July 1982, *(Int. Comm. Glass; Societe Francaise de Physique)* [Dec. 1982] 64580 (introductory abstract), 66835−43, 66855−92, 66915, 66965, 67036, 67103, 67106, 67115, 67183, 67207, 67224, 67231, 67240, 67252, 67258−60, 67271−80, 67288, 67318−20, 67565, 67598−9, 67638, 67682, 67897, 67999, 68012−14, 68048, 68064, 68098, 68153−4, 68205−7, 68246, 68274, 68302, 68344, 68499−500, 68579−80, 68630−9
Physics of semiconductors; Montpellier, France, 6-10 Sept. 1982, *(IUPAP; Societe Francaise de Physique; European Phys. Soc)* [March 1983] 66324, 67116, 67125−7, 67137−40, 67431, 67436−7, 67443−5, 67452, 67462−71, 67481, 67513−28, 67571, 67601−6, 67621−8, 67652, 67674, 67685, 67762, 67914, 67938−9, 68015, 68021−2, 68157−8, 68180−2, 68211−17, 68259−60, 68269−70, 68276−80, 68304−11, 68345, 68401
Physics of semiconductors; Montpellier, France, 6-10 Sept. 1982, *(IUPAP; Societe Francaise de Physique; European Phys. Soc)* [March 1983] 66844−7, 66893−4, 66967, 67043−5, 67141, 67290, 67322−3, 67349−51, 67402−5, 67420, 67429, 67433, 67453−4, 67485−6, 67491, 67494, 67500, 67540−2, 67553, 67572, 67607−11, 67629−30, 67640−3, 67653−8, 67675, 67686−7, 67707−11, 67717−33, 67749−51, 67763, 67779−83, 67793−6, 67815−16, 68026, 68050, 68080, 68085, 68134, 68142, 68159−62, 68218−24, 68247, 68261, 68281, 68312−15, 68346−8, 68402−4
Power engineering; Manchester, England, 30 March-1 April 1982, [Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982] 66179, 68849, 68875
Precision electromagnetic measurements, 1982; Boulder, CO, USA, 28 June-1 July 1982, *(NBS; IEEE; URSI)* [1982] 64875, 64917, 66046, 66307−9, 68993, 69507
Probing the Earth's lithosphere by controlled source seismology; London, Ont., Canada, 22-23 July 1981, [April 1983] 64583 (introductory abstract),
Processes of planetary rifting; St. Helena, CA, USA, 3-5 Dec. 1981, *(American Geophys. Union; Lunar & Planetary Inst.; NASA; NSF)* [1983] 64585 (introductory abstract), 69109, 69153−4, 69170−86
Saw devices; London, England, 23 Feb. 1983, [London, England: IEE 1983] 64596 (introductory abstract), 66426−9, 66436, 66441−3
Signal recovery and synthesis; Incline Village, NV, USA, 12-14 Jan. 1983, *(Opt. Soc. America; Air Force Office Sci. Res)* [Washington, DC, USA: Opt. Soc. America 1983] 66231−2, 69512
Simulation 1983; Tampa, FL, USA, 16-18 March 1983, [New York, USA: IEEE 1983] 68978
Sintering, theory and practice; Portoroz, Yugoslavia, 7-10 Sept. 1981, *D.Kolar, S.Pejovnik, M.M.Ristic (editor/s),* [Amsterdam, Netherlands: Elsevier 1982] 66917, 67668, 68467−9, 68473−6, 68481, 68485−97, 68551, 68652−4

IEE
ELECTROMAGNETIC
WAVES SERIES

Published by Peter Peregrinus Ltd., on behalf of the Institution of Electrical Engineers.

1 Geometrical theory of diffraction for electromagnetic waves
G. L. James

253 pp., 216 × 135 mm, 75 diagrams, casebound, 1976, ISBN 0 901223 70 0, price: £13.50 UK, £15.80 Overseas

This book provides a thorough and clear exposition of the g.t.d. formulation for vector fields. It begins by describing the foundations of the theory in canonical problems and then proceeds to develop the method to treat a variety of circumstances. A final chapter supplies some fully worked examples of the application g.t.d. to some practical problems.

2 Electromagnetic waves and curved structures
L. Lewin, D. C. Chang, and E. F. Kuester

198 pp., 216 × 135 mm, 12 diagrams, casebound, 1977, ISBN 0 901223 97 2, price: £11.00 UK, £13.00 Overseas

The advent of optical communication has brought with it a renewed interest in the propagating and radiating properties of dielectric guides and surfaces, both straight and curved. This volume brings together many of the methods and results that have been developed in this area.

3 Microwave homodyne systems
R. J. King

368 pp., 216 × 135 mm, 50 diagrams, casebound, 1977, ISBN 0 901223 52 2, price: £14.00 UK, £16.40 Overseas

This volume considers homodyne detection for various types of modulation, and then applies these principles to the measurement of transmission or reflection parameters of devices, the measurement for **E** or **H** fields in open or closed structures, automated homodyne systems, automatic frequency stabilisation of microwave sources, and coherent transponding systems.

4 Radio direction finding
P. J. D. Gething

329 pp., 216 × 135 mm, 126 diagrams, casebound, 1978, ISBN 0 901223 71 9, price: £13.50 UK, £15.50 Overseas

This volume is concerned with the general principles underlying the design of improved radio direction finders, particularly for the complex propagation conditions that occur in the h.f. band. Topics include the computer analysis of wave-fields, and the measurement of elevation angles as well as bearings.

5 ELF communication antennas
M. L. Burrows

255 pp., 216 × 135 mm, 71 diagrams, casebound, 1978, ISBN 0 906048 00 1, price: £11.50 UK, £13.50 Overseas

The volume brings together for the first time all the design fundamentals for antennas in this increasingly important part of the radio spectrum. The applications are short- and long-range submarine communications, ultra-stable worldwide communication from a single sight, mine and sub-terrainian communications, and remote sensing.

This series is published on behalf of the Institution of Electrical Engineers and distributed by Peter Peregrinus Ltd., PO Box 26, Hitchin, Herts. SG5 1RJ, England

IEE

Librarianship and Information Studies Series

The authors in this series deal in a practical way with the problems faced by libraries and information scientists that have been the subjects of research within past years. The results of the latest research are analysed, discussed and related to real situations. Workers at centres of study of librarianship and information science will, through this series, be presented with invaluable aids to further research; librarians and information scientists 'in the field' will also find much food for thought.

1. Computer-based information services in science and technology: principles and techniques.
M. F. Lynch

96pp., 234 x 156mm, casebound, 1974, ISBN 0 901223 55 7,
£3.65 UK, $ 9.00 Americas, £4.30 Elsewhere

This book covers the application of computers to the major information services in science and technology. Coverage is given to the problems of character representation and transformation during input; storage and output; data and record description and storage structures; and typical filehandling systems and file manipulations. The role of computer type-setting in the production of publications is described at some length, as are the characteristics and implementation of information-retrieval services.

2. Asian and African collections in British libraries: problems and prospects
A. Benewick

139pp., 234 x 156mm, casebound, 1974, ISBN 0 901223 48 4,
£6.20 UK, $ 14.50 Americas, £7.25 Elsewhere

This book discusses the administrative problems of establishing and maintaining Asian and African collections in Britain. Particular emphasis is placed on acquisition, interlibrary co-operation, bibliographical control and finance. The impact of area collections on general library techniques, and the prospects for area collections, from the viewpoint of developing adequate national provision for them, are also discussed.

3. Languages of indexing and classification: a linguistic study of structures and functions
W. J. Hutchins

160pp., 234 x 156mm, casebound, 1975, ISBN 0 901223 68 9,
£8.00 UK, $ 19.00 Americas, £9.35 Elsewhere

Within the broad field of information science, the problems of indexing and classification continue to occupy positions of central and crucial importance. In recent years there have been impressive developments in automated information-retrieval systems, but these have not led to any lessening of interest in indexing and classification theory, although understanding of these basic processes remains inadequate. This volume contributes to the understanding of the fundamental questions of the nature of indexing languages—how they work and why they sometimes fail. This book is an examination of the basic features of the theoretical issues of indexing and classification in terms of linquistic structures and functions, and assumes that readers have some knowledge of the languages of documentation and the problems of indexing and information retrieval.

4. Libraries for the blind: an international study of policies and practices
D. E. Schauder and M. D. Cram

152pp., 234 x 156mm, casebound, 1977 ISBN 0 901223 91 3,
£10.00 UK, $ 23.50 Americas, £11.70 Elsewhere

This study reviews contemporary practices, policies and trends in library services for blind and partially sighted people. Most available accounts of such services have confined themselves to a particular country, reading medium or technical development. This study, however, can be said to be truly international, and extremely comprehensive. The authors, both practising librarians, present the results of research which included many visits to libraries for the blind and related organisations, from which valuable information was gained that was not readily available except by personal contact. Furthermore, their literature search extends up to 1976, resulting in an extensive bibliography. The book can be used equally as a textbook for students of librarianship, or as a guide for practising librarians.

5. Information management
D. Mason

121pp., 234 x 156mm, casebound, 1978, ISBN 0 906048 15 2,
£7.50 UK, $ 18.00 Americas, £9.00 Elsewhere

This volume is a highly practical guide to the management of industrial information services. From the premise that the information manager should take a positive approach to his company's information needs, the author discusses the managerial problems of establishing and running an information service within a company and emphasises practical techniques for their solution. Location, planning and finance are some of the topics covered. Several case-study excercises are given to underline the text, and key texts for further study are appended to each chapter. Although written primarily for industrial information managers and for new entrants into industrial information services, this volume will be of interest to all who work in, or are responsible for, information services.

Inquiries, and orders with remittances should be sent to:

Publication Sales Department, Peter Peregrinus Ltd.,
PO Box 26, Hitchin Herts. SG5 1SA, England.

Orders for the Americas should be sent to:

OTHER INSPEC SERVICES

SDI

(Selective Dissemination of Information.) This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm × 100 mm (6″ × 4″) cards.

TOPICS

This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES

Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.
